No person is going to quarrel with the Alberta people if from present shivering conditions they can work out a plan that will increase the Pennsylvania anthracite coal supply for Eastern Canada, and at the same time add a degree of stability to Western Canada mining that does not now and never has existed.

## CLOCK TINKERING COMING

ALTHOUGH no person has got up to say so, the general impression is that daylight saving will be brought into Canadian life this year.

Sir George Foster wished the matter on the Federal House the last time D.S. came officially to life. It had a short, inglorious career, a terrific bombardment, a sudden death, and if mourners there were, they failed to turn up on the day of the funeral.

It was a Union affair as far as opinion in the House was concerned. Grits who were broad enough to be called Reformers, and Tories with the edges rubbed off sufficiently to pass as Liberal-Conservatives, all joined in heaving bricks at Sir George's D.S. measure. He dragged it out of no-man's land and laid it away.

It has been laid away ever since.

But we're acquiring quite a habit of doing things here because they do them at Washington. Some folks don't like this, but we're dealing with conditions and not theories.

Not long ago Garfield spoke to the republic. In effect he said "Shiver," and for five days in a row, and a procession of Mondays following, they shivered. And so it came that Magrath, the Canadian Fuel Controller, gave the Canadian people a three-day shivering sentence, whereupon we fell in line and shivered.

Washington has ordered a general tinkering with the clocks, and it begins to look as though some person were ready, despite Sir George Foster's experience, to start the machinery in operation that will result in clock tinkering in Canada.

If tinker we must, let's go it together. Anything less than Dominion-wide or nation-wide action will simply mean the 1918 chapter of Confusion Worse Confounded.

## BRINGING THE WAR HOME

SOME of the apologists for heatless days in United States claimed that it was high time the people of the republic were having a few object lessons that would make them realize that the republic was at war.

They reckoned that heatless and workless days would have this effect. So the first order was for five heatless days, and then an intermittent series, making in all thirteen of them.

From official sources it was suggested that employers should make an effort to pay wages as usual.

It would be quite an object lesson of the horrors of war to have a string of holidays with the pay days coming and going as usual.

If the proportion of employers and employees is 95 to 5, it means that the object lesson is for the five per cent.

Taking a few days off with wages as usual is rather a vague way of feeling the horrors of war.

## WAR AS A TEACHER

WILLIAM C. REDFIELD, United States Secretary of Commerce, is making an effort to cause United States manufacturers to realize that they have got to get their house in shape for the aftermath of war. Apart from the question of maintaining credits, Mr. Redfield sees something bigger than the financial element in the case.

In brief he advocates: (1) overcoming past failures in applying science to industry, the United States official holding that this was the secret of Germany's tremendous development; (2) a greater application of the principle of technical training for industrial workers, to bring about the happy co-operation of trained minds leading trained workers; (3) greater knowledge of costs, and (4) the elimination of industrial and commercial waste.

The war is teaching individuals, firms and nations more lessons in the matter of stopping leaks than they ever learned before.

When war teaches a lesson it does not stop to ask if the pupil is willing or otherwise.

The willing one learns and comes out on top of the heap.

The man or firm who will not learn or bend goes on and goes down. The bailiff or the assignee conducts the rest of the obsequies.

# Increased Outputs and General Activity Looked For

Conditions at the steel plants have improved and operating conditions are in the meantime more favorable which should result in an increase in output. Supplies of coke are moving in steadier volume which also benefits the steel plants and foundries. There is a good demand for pig-iron but the furnaces are having considerable difficulty in filling orders as promptly as required owing to the deficient supplies of coke. Prices of steel products are generally holding firm and are unchanged except for black and galvanized sheets which have declined. Conditions in the iron and steel trade in the United States have improved and production has recently shown a slight increase. The demand for steel continues very heavy and the mills are still falling behind on deliveries. The scrap metal market is dull and business very quiet. Dealers report a shortage of most kinds of scrap and no change in prices. In the non-ferrous metal markets, tin continues to be the outstanding feature and the price has again advanced. Tin is getting scarcer than ever, there being practically no spot metal obtainable. Copper supplies are heavier and prices continue firm. Castor oil is off the market and prices have been withdrawn. A sharp advance has been made in the price of linseed oil due to the scarcity of flaxseed. Some manufacturers of cotton waste have advanced their prices in line with higher prices prevailing on other makes. The machine tool market is quiet and devoid of any outstanding feature. Indications point to an improvement in deliveries but prices will likely remain high owing to the high cost of labor and materials.

MONTREAL, Que., Feb. 25, 1918.—The demoralization of industry that has been so pronounced during the past two months is gradually being eliminated, but a continued spell of favorable weather will be necessary before the operations of the railroads will again be normal. The coal situation is not so acute and it is anticipated that conditions will slowly adjust themselves to the permanent relief of the country and permit the resumption of activity to the maximum requirements for war purposes. Favorable progress is being made on the contracts for the vessels being constructed for the Dominion Government; the necessary steel being delivered with reasonable promptness. The manufacture of shell has been backward, particularly those being made for the American Government, as the delivery of the necessary steel and forgings has been delayed, greatly inconveniencing those firms having contracts for these shells.

### Steel

Favorable weather conditions have been the means of reducing the pressure that has been felt on all the railroads during the past couple of months, with the result that the congestion is steadily being relieved and the movement of freight is becoming more normal. It will require considerable time to move the accumulation of materials that have been piling up at many points. Efforts have been made to confine the manufacture of iron and steel in the United States to those commodities that are absolutely necessary for existing requirements. To a great extent this has been successful, as the bulk of the steel produced at the discriminate on the present consumption of iron or steel, as many of the activities when properly analyzed, are found to be indispensable in the important work of carrying on the war. With the exception of the Government construction of buildings for war purposes, the output of domestic steel for structural work has been reduced to the minimum. Shipments from the mills are much better, indicating some relief in railroad congestion, so that with the moderation of the weather the improvement from now on should show a marked increase. The export of material has been made very difficult during the past several weeks not so much by the shortage of available space on ocean going vessels as owing to the inability to deliver the gods to the seaboard. This condition has, however, been greatly improved recently and a continuance of the present favorable weather will in a short time eliminate the difficulties under which the railroads have been operating. Canadan conditions are relatively unchanged and are practically reflected by those existing in the States. Developments for the improvement of the Canadian steel situation are apparently meeting with success. A factor that has materially affected the manufacture of shells in Canada has been the inability to secure sufficient steel to carry on at maximum capacity. This is particularly noticeable in connection with the production of the American 75 mm. shells, as those firms here that have obtained contracts for these shells are experiencing considerable difficulty in obtaining steel and also forgings. The market generally is very firm and dealers here report no change in quotations.

### Metals

The general metal situation is not marked with any special feature and conditions are relatively normal. Copper is steady and unchanged. Tin has developed a slightly easier undertone. Spelter is quiet on poor demand. Lead is inactive and inclined to weaken. Antimony and aluminum are quiet and unchanged.

**Copper.**—Activity in the copper market is not pronounced but the demand is steady and the production ample to meet the requirements of all essential industries. Some domestic users are suffering under the restriction at present prevailing, but operating conditions are generally of a satisfactory character. The increased facilities that have been developed for the refining of copper may this year enable sufficient metal to be produced to provide ample metal for all requirements. At present the need for essential war purposes receives priority over all other demands. Business locally is of a very encouraging character and dealers report a steady market with quotations firm at last week's price of 31 and 32c per lb.

**Tin.**—Despite the fact that tin is very difficult to obtain, consumers apparently are able to carry on operations but often under considerable difficulty. The British regulations regarding the shipment of tin are still the chief factor in the problem of obtaining sufficient metal for consumers here and in the States, but during the past week the tension has not been so pronounced and reports are current that early relief may be expected. The easier tone reported from London has relieved the tension in New York and the market has developed a quieter tone, but all quotations are still of a nominal character. Dealers here are asking 82c on a quiet market, but the situation has an undertone of weakness.

**Spelter.**—Activity is light and the market is quiet. The demand is not

heavy and the available metal prevents the situation from taking on the strength that producers think should be shown under present conditions. The market is firm both here and in New York. Dealers here report unchanged quotations, the price asked being 11c per lb.

**Lead.**—The market is inactive and consequently prices are inclined to be easier. The demand indicates no exceptional activity and business is apparently comparatively dull, but quotations are nevertheless well maintained. Local dealers continue to ask 10c on spot. Supplies are adequate to meet all requirements.

**Antimony.**—The market is quiet and unsettled with quotations weakening. The demand is light and supplies are ample for present needs. Dealers here continue to quote 18c, but anticipate a slight decline.

**Aluminum.**—The situation is devoid of feature and the demand is normal. The market is steady with an easier tone, price asked being 55c per lb.

### Machine Tools and Supplies

The demand for machine tools has been comparatively quiet during the past week, especially for new equipment. Inquiries for shipbuilding machinery have not been so active although some business has been done. The abnormal demand for all classes of tools in the States has made it increasingly difficult to obtain delivery of machinery from this source; this applies mostly to such equipment as is urgently needed for war purposes. The pressure of business is so excessive in some connections that makers are reluctant to accept orders for specified delivery; this is partly due to the uncertainty that surrounds the activities in the States, as the placing of government contracts must receive precedence over other business. Inquiries for used machinery is the feature of the present market as dealers report considerable activity in this connection. Requirements for supplies are of a normal character, the demand being particularly active in connection with the shell and shipbuilding industries.

### Scrap

A better tone is apparent in the old metal situation as a result of the relief that has been evident in the movement on the various railroads, which has enabled the freer transportation of scrap to the consumers. The market is not exceptionally active but the nervousness has been largely removed by the recent fixing of prices by the American Government. The New York market is firm and unchanged with the exception of tin scrap, which has taken an a much stronger tone owing to the abnormal conditions prevailing in the pig tin situation. Local dealers report a steady but inactive market with all quotations on the basis of those quoted last week.

## Toronto

TORONTO, Ont., Feb. 26.—The coal situation is brighter as a result of a freer movement of cars on account of the milder weather. It is understood that dealers in the city received 12,000 tons of coal over the week-end, and that the total for the past two weeks has been well up to normal demand. It is hoped that supplies will be adequate for the balance of the winter. It is reported that by April production at the mines will be showing an increase of at least 20 per cent., and an endeavor will be made during April and May to accumulate reserve stocks.

### Iron and Steel

The situation in the iron and steel trade has improved on account of the more favorable weather now prevailing and a more optimistic feeling prevails in the market. Although some cold weather may still be expected, the worst part of the winter has passed, and it is hoped that the production of iron and steel will begin to show steady and continuous increase. Traffic conditions are easier, and there has been an increase in volume of freight moved from the border, thus relieving the shortage of fuel to some extent. The scarcity of coke, however, is due principally to the car shortage, and it will likely be some considerable time before conditions in this respect are greatly improved owing to the difficulty in obtaining cars. Car supplies at the ovens this week have improved. While shipments this week will show an improvement over those of last week the movements will be below normal requirements. The Steel Company of Canada has blown in the furnace at the Hamilton works, which had been out of commission for several weeks on account of the coke shortage. Hamilton foundry pig iron will be on the market again very shortly.

The bulk of the business in steel continues to be for war orders, although there has been some improvement recently in demand from concerns not engaged on war contracts. Canadian steel plants are supplying considerable of this class of material, and deliveries are fairly good considering prevailing conditions. The new regulations now in force in the United States have given the American Government more control over the exportation of steel, and consequently it is improbable that much material will come in except in connection with war contracts. In the States a license to manufacture has now to be obtained in addition to a shipping license on export business. Available supplies of steel in the States for Canadian consumers have for some time been restricted on account of the serious decline in production. Conditions, however, have recently improved and a heavier tonnage is now obtainable.

Prices of iron and steel products generally are holding firm, but there has been another decline in black and galvanized sheets. The decline is due more to conditions surrounding these particular products than to any general weakness in the market. Black sheets No. 28 gauge are now quoted at $8.25 and No. 10 gauge $10 per 100 lbs. Premier galvanized No. 28 are now quoted at $9.20 and 10¾-oz. at $9.50 per 100 lbs. Chequered floor plate, 3/16-inch, is now $12.20, and ¼-inch $12 per 100 lbs., representing a decline of $1 per 100 lbs.

### CANADIAN GOVERNMENT WAR PURCHASING COMMISSION

**The following gentlemen constitute the new war Purchasing Commission. Sir George Foster, Minister of Trade and Commerce; Frank P. Jones, Montreal; J. W. McConnell, Montreal; James H. Gundy, Toronto; Charles McNaught, Toronto, and Joseph Gibbons, Toronto. C. A. Magrath, as Fuel Controller, and Hon. H. Laporte, as chairman of the War Purchasing Commission, are members of the board ex-officio. Sir George Foster is Chairman of the Board.**

### Scrap

There has been no improvement in the scrap market this week and business continues dull, with quotations unchanged. Dealers' stocks continue low, which is tending to keep prices firm in spite of the slow demand. The railway congestion continues to interfere with shipments, although in this respect conditions are improving. Some interest is being shown locally in the situation in the States. A revised schedule of prices of iron and steel scrap will, it is reported, be announced shortly by the committee on steel and steel products of the American Iron and Steel Institute. The new prices and scrap classification, it is believed, will meet with the approval of consumers and dealers generally.

### Machine Tools

Conditions in the machine tool trade are much the same as last week—that is to say, the market is quiet. The demand for equipment for munitions manufacture, while comprising most of the business offering, has fallen off considerably, as the plants, with few exceptions, are fully equipped. In the States deliveries of machine tools are improving, but there is apparently little prospect of prices being reduced. The high cost of labor and materials will militate against price declines for some time to come. The Dominion Shipbuilding Co. are proceeding with their new plant here. It is expected that construction of the shops will begin shortly.

### Supplies

[illegible] supplies continues fairly active, with prices for the most part holding firm. Castor oil being off the market, prices have been withdrawn. Although crude oil advanced recently, there has been no change in gasoline or coal oil. Linseed oil is higher on account of a sharp ad-

demand for waste within recent weeks. through the strong situation in the cotton market.

### Metals

In the non-ferrous metals the feature of the week has been a sharp advance in tin, due to the continued scarcity of spot lies. Spot tin is scarcer than ever, and no relief is expected for some time. The copper market continues a routine affair, with local prices holding firm. is holding steady, and spelter is r, with no change in prices in either case. Aluminum is firmer, but antimony is dull, with a weaker tendency. Business locally continues good.

**Copper.**—The primary market is steady and firm at the established price of 23½c per pound. Production at the mines and refineries is far from capacity, but the situation is improving, and it is expected to make progress under better weather conditions. War requirements are concerning the greater part of the output, the available supply for non-essential trades being consequently curtailed. Lake and electrolytic are quoted at 29c and casting at 28c per pound.

**Tin.**—There is no improvement in the tin situation and prices are still advancing. No relief is expected until supplies come in from the Far East via the Paci- Spot tin is scarcer than ever, and entirely nominal. Locally tin at 85c per pound.

**Spelter.**—The market is dull, with consumers showing little inclination to start any new buying this month. There has recently been a considerable falling off in demand for brass spelter. Local price,

**Lead.**—The market is firm and steady, and situation unchanged. The trust is quoting 7c New York for spot lead.

## Washington

WASHINGTON, Feb. 23.—The United Officials of the Government responsible for the production of the war material deniably worried over the prospect of a proper steel supply to insure the carrying shortage is caused by two factors largely—the problem of transportation and labor. According to officials here, the transportation problem is causing many steel mills to run on short time because they are unable to secure either coal or the pig iron necessary. On the other hand, the finished product is often stacked in their storehouses for weeks at a time because of a lack of cars to carry it away, and when the storehouses become filled and all available storage space occupied it becomes necessary to curtail production. This has affected an already short labor supply. Because many steel mills are forced to close or work on short time labor is turning to other lines of industry, according to the reports received by officials here.

Word has been received here that efforts will be made to relieve this situation by the establishment of a string of steel mills on the Pacific Coast. A syndicate of Pacific Coast manufacturers is being formed, and it is understood that several plants are planned for British Columbia and Alaska.

### Labor Problem Improving

The labor situation in the shipping industry in the United States is considerably relieved. Strikers who left their work last week and threatened a tie-up of the industry along the entire Atlantic Coast have for the most part returned to their work and the matter of wages has been left largely to adjustment. Work has been resumed in all shipyards and the work of shipbuilding is progressing now on schedule, and officials declare that early spring will see the work so well organized that the future will be far brighter than it has been at any time for the past few months.

Federal investigators of the Department of Justice are at present engaged in securing evidence concerning the building of the Hog Island shipyards with a view to determining whether the Government has grounds for civil or criminal action on charges of reckless expenditure of Government funds. The Senate Commerce Committee, which started the investigation of the Hog Island yard, and the American International Corporation, the builders, went to the yard on Monday and made a personal investigation of conditions.

### Canadian Trade Preference

The War Trade Board has issued a blanket license for all imports from the United States to Canada, as it was predicted in this letter last week. Despite the embargo upon all imports laid last week by the President of the United States in order to conserve the shipping space of the nation, Canadian manufacturers will be allowed to import their products into the United States without ...ce for an individual license to import.

The United States Senate has passed the Railroad Bill, which provides for the Federal control of all American railroads until eighteen months after the end of the war. The bill as passed by the Senate is substantially the bill prepared by the Administration, with the exception of the time limit placed upon Federal control and the limitation of the power of the President to make rates. An amendment has also been added to the bill, which provides that the Government must take over all short line railroads. It is expected that the House will act accordingly.

Industries in the United States, which have been pressed financially since the outbreak of the war, are to be afforded relief by the Government. Secretary McAdoo's War Finance Corporation will be enacted in the laws within a week, and the Government will then be in a position to make direct loans to railroads, public utilities, and industries which are necessary to the conduct of the war. With these broad powers the Government is now in a position to finance any industry, necessary to the war, which has been unable to weather the financial strain.

### Contractors' Identity

American industry has been the gainer in an order issued by Secretary of War Baker this week instructing all purchasing agents of the army to make public the names of all contract holders. This point has long been an issue between the industrial men of the country and the War Department. Industrial leaders claim that unless they know to whom contracts are awarded they are laid liable to unfairness on the part of officials. As yet no order has gone forth from Secretary Baker for a general call for bids for supplies, however. This is another point which business men are striving to make.

The fuel situation in the United States is such now that Federal Fuel Administrator Garfield has allowed predictions that a reduction in prices generally is soon to be made. No official announcement of this has been made, but it is understood that a draft of proposed new prices is now before Dr. Garfield. The shortage which was created by a car shortage is about over. Production is still short, however, and particularly in bituminous coal.

### Crop Precautions

An embargo on corn to the Dominion of Canada has been laid by the United States. This has been caused by the general shortage of corn seed in the United States, and it is hoped that it will preserve enough so that the crop for next season will not be endangered.

Increased traffic rates, particularly passenger rates, by the Railroad Administration is now expected. It is understood that rates on passenger fares and freight on non-essential classes will be raised in order that room may be made for necessary freight.

## New York

NEW YORK, Feb. 23.—It is estimated that steel manufacturers have suffered losses of $100,000,000 to $150,000,000 in the last month because of reduced plant operations made necessary by the shortage of fuel and inadequate railroad service which resulted in great congestion of rolled products at the finishing mills. The worst is now over, however, output of both iron and steel having been increased from 20 per cent. to 25 per cent. of capacity in the last ten days. There is much irregularity in plant operations in various sections of the country and the manufacture of poor quality of steel resulting from the necessity of using low grades of coke and high sulphur coal will long be felt through rejections of plates and other finished forms.

Eight or ten manufacturers who have received shell orders from the Government have been buying shop equipment and a much larger number are negotiating for tools to be purchased when Government contracts pending are released. There is a lack of forging capacity at present but when plants now in course of construction are completed many Government shell contracts will be closed. Although the machining equipment of the country is large and in excess of the forging capacity some manufacturers who have recently received orders for projectiles are finding difficulty in sub-letting contracts for machining. It is estimated that the shell contracts now pending will require the expenditure of about $200,000,000 by the government and negotiations with ordnance manufacturers will also result in contracts, mainly for field pieces and big guns for the army, which will cost approximately $200,000,000.

### Machine Tool Demand

One of the most interesting developments is the active demand for machine tools and for cranes by the Worthington Pump & Machinery Corp. which has taken the contract to build pumps for the submarine destroyers now being constructed at the Detroit work of the Ford Motor Co. These pumps will be manufactured at the Dean Pump Works, Holyoke, Mass. The Bartlett & Hayward Co. of Baltimore has placed an order for 300 more tools for the making of 155 mm. shells. The Otis Elevator Co. will make recoil cylinders for 9.5-inch guns at its Western plant and has made additional purchases of shop equipment. It will also manufacture 175 boring lathes at its own plant. The American Brake Shoe & Foundry Co. wants 40 lathes for work on 6-inch shells. The Defiance Machine Works, Defiance, Ohio, wants to buy 25 machine tools and the Salisbury Wheel & Manufacturing Co., Jamestown, N.Y., is in the market for 25 turret lathes.

Manufacturers of war munitions, notably makers of large guns, gun lathes and gun carriages, are actively in the market for metal working planers. Ship yards are also buying planers. The Westinghouse Electric & Manufacturing Co., which makes reversing electrical motors for planers, has recently taken heavy orders for equipment aggregating 2,600 h.p. Among manufacturers who have placed contract, for electrically driven machines are the Baldwin Locomotive Works, the Federal Shipbuilding, Newark, and the New York Shipbuilding Co., Camden, New Jersey. The Hanlon Drydock & Shipbuilding Co., San Francisco, has recently purchased $200,000 worth of machinery in this market including a number of second hand tools.

Structural work is more active, orders for 20,000 tons being placed in the last few days, mainly by manufacturers engaged on Government work. It is estimated that the War Department will spend $125,000,000 for war plant of various kinds, including $46,000,000 for aviation work, $37,000,000 for a gas making plant in this vicinity, 40 storage depots in the interior and others along the Atlantic coast. The E. W. Bliss Co., Brooklyn, and the Western Electric Co., making war muntions, have placed contracts for plant extensions calling for 5,500 tons of steel shapes.

## Pittsburg

PITTSBURG, Pa., Feb. 23.—While the weather has been colder the past few days, it has, on the whole, been relatively favorable for railroad operation, and it may be said in general that there has now been favorable railroad weather since February 6. It continues to be the case, however, that the chief effort of the railroads is in the direction of moving loaded cars to destination so as to clear the congestion, and relatively little has been done thus far towards furnishing the furnaces and mills with more cars for loading. The result is more coke at blast furnaces, resulting in more pig iron being produced, while the shipments of finished steel are only slightly increased.

There is no doubt that the railroads are making excellent progress in their clean-up and that congestion is being reduced as rapidly as could be expected. Large shippers, familiar with the situation, seem to be well satisfied even though definite results, in heavier shipments of finished steel, have been small thus far. They are quite ready to give the railroads two or three weeks more time in which to get into really fair operating condition.

### Coke Shipments Light

Supplies of cars in the Connellsville coke region in the past week have been altogether disappointing, as they certainly showed no material improvement over those of last week, and may even have been lighter. The Connellsville *Courier* reports last week's shipments from the Connellsville and lower Connellsville region, at 282,359 tons, against 275,907 tons the week preceding. It may be estimated that shipments of about 375,000 tons a week at least are required to meet the requirements of furnaces depending upon this region, including certain stacks in Canada. At the moment, position as to coke than would be indicated by the shipments for the reason that in the railroad clean-up a great deal of coke that was stalled en route was moved forward to furnaces, and, with the furnaces depending upon their by-product, the ovens were fairly well supplied; it may be estimated that the furnaces are operating at 75 to 80 per cent. of capacity. This rate cannot be maintained, however, unless shipments are heavier than as just reported.

Shipments of finished steel from mills have averaged in the past week a trifle more than 60 per cent. of capacity, against a previous average this year of between 55 and 60 per cent., but with some weeks showing barely 50 per cent. As blast furnace operations show a much higher percentage than finished steel shipments, there must be accumulation at some point. In some cases pig iron is accumulating, while in the case of many steel works with furnaces attached the production of steel has been increased, the steel accumulating in ingot or billet form. Some erroneous reports have been published, referring to much better mill operations, and these may be based upon increased ingot production, sight being lost of the fact that the steel is not all carried through the finishing processes and actually shipped. The mills, indeed, are indisposed to finish more steel than they can ship, as yards and warehouses are already well filled, and it is more economical to reduce stocks as car supplies increase.

### Purchases For Railroads

Reports from Washington are that the United States Railroad Administration expects in the very near future to place large orders for the purpose of rehabilitating the railroads now that the Senate has passed the railroad control bill, and the House will pass its bill within a few days. It has been known to the steel trade for quite a while past that the authorities at Washington had carefully studied the situation, and formulated plans for the placing of large orders for equipment, and probably also for additional terminal facilities, and perhaps some trackage. Reports from Washington are that as much as $500,000,000 to $750,000,000 may be spent on the program. One-half the smaller amount would cover, or nearly cover, 2,000 locomotives and 100,000 cars, leaving a large amount for other work, and orders of the size mentioned would mean a great deal to the [illegible]

### Curtailing in Unessentials

It appears that the authorities at Washington are making a fresh study of the matter of curtailing the unessential consumption of steel in view of the continued scarcity. The steel producers are inclined to believe that the effort will lead nowhere. They are quite familiar with the character of the orders on their books, and the character of the material that has been shipped in recent weeks, and their conclusion is that at the present time there is very little steel that [illegible]

of supply to furnish it.

consumption as is disposed to continue. Some steel producers feel that in such circumstances there would be a surplus

Actual market transactions continue extremely light. Buyers are indisposed to plan ahead as conditions are all so uncertain, and as to immediate requirements, their orders are already in, and have been for a long time. What they want is shipments. Fully two-thirds of the steel being shipped is for war purposes, directly or indirectly. With the practical certainty that there will be no legislation by Congress in the near future to empower the Government to fix iron and steel prices, the question is whether the authorities at Washington will make an effort to revise the agreed prices, which late in December were pronounced as effective to Mar. 31. Producers insist that there should be no revision at this time. As production has been greatly curtailed, with a consequent increase in costs, and is likely to increase very considerably in the next few weeks, Washington will hardly press the matter of price revision for a while.

## CANADA'S RECORD IN MUNITIONS PRODUCTION

HON. NEWTON ROWELL, speaking at the Toronto Y.M.C.A. on Saturday before a number of business men from Detroit, gave some interesting figures in connection with Canada's effort in the war in the production of munitions and war material. Mr. Rowell said that "Through the Imperial Munitions Board orders have been placed in Canada for

the sum of $875,000,000 already has been expended in respect of these orders in plants established in every province of Canada outside of Prince Edward

He said there were between 500 and

of the total number used by Great Brit-

### Fuse Output

When Canada first commenced making shells the fuses were made in the United States, because it was thought the manufacturers in the Republic were in a better position to produce them, but later on orders were placed in the Dominion, and in a short time Canada was turning out fuses at the rate of 2,750,000 per month of such a high degree of excellence that the Imperial authorities went out of their way to congratulate the Imperial Munitions Board. Canada had also manufactured 16,500,000 wooden boxes in which to ship munitions overseas. She had also been steadily producing explosives, such as cordite, "T.N.T.," acetone, methyl-ethyl and nitric acid, in order to keep the forces of the British Empire supplied. The refining of zinc, copper and molybdenite had been going on steadily, and the capacity for refining lead had been largely increased. We were also shipping overseas large quantities of asbestos.

### Making Munitions for U.S.A.

Another statement was the announcement by Mr. Rowell that Canada is now rendering assistance to the United States in the production of munitions, and is at present engaged on orders for 7,000,000 shells, 10,000,000 forgings and 2,000,000 cartridge cases for the United States Government.

### 300 Airplanes a Month

"We have had phenomenal success in the airplane industry," said Mr. Rowell, "and we are now producing more than 300 airplanes a month. We are supplying all the planes used by the Royal Flying Corps in 500 encampments, and also supplying planes to the United States Government to a large extent. Also 1,000 high-grade airplane engines are at present being constructed in Canada. The sum of $10,000,000 has been spent in airplane plants and aerodromes in Canada. When the Camp Borden aerodrome was constructed the aviators were flying two months after the workmen started to clear the land of tree stumps.

### 350 Million Tons of Ships

"Orders have been placed in Canada for 350,000,000 tons of steel and wooden ships, at a cost of $64,000,000, and the Union Government is now developing a large shipbuilding programme. Many of the ships being built will be owned by the Government of Canada. We will produce in Canada this year more than one-quarter of the commercial tonnage built in the United States, and more than one-fifth of the commercial tonnage built in Great Britain last year.

### Munitions Board Effort

"In addition to these remarkable results for munitions we have sent hundreds of thousands of men to the fighting line, and have been engaged in the production of food. We have done this by a combination of great organizing skill and remarkable administrative ability by the Imperial Munitions Board, which is composed of great Canadians, by the manufacturers, and by the sturdy, honest toil of the working men of Canada."

## DOMINION STEEL CORPORATION PRODUCTION.

THE output of the Dominion Steel Corporation for the year ending December 31, 1917, is estimated as follows:

Pig iron, 341,000 tons; steel ingots, 353,000 tons; blooms, billets, etc., for sale, 154,000 tons; rails, 16,000 tons; wire rods, 100,000 tons; merchant bars, 1,300 tons; wire and product of wire, 35,700 tons; ore, 651 gross tons; stone, 524,000 tons.

During the past year the reconstruction of a 400-ton blast furnace was undertaken and practically completed; this should be ready for operation during March, 1918, at about which date there will also be completed the construction of 120 latest design Koppers By-Product Coke Ovens. The company has recently undertaken extensive improvements to the electrical power and water supply equipment of the plant, and this work will be pushed to completion as rapidly as possible.

According to the president, Mark Workman, the 1917 output of coal will fall at least 500,000 tons below that of 1916, and 1,250,000 tons below normal. The record for 1917 probably will be below 4,000,000 tons, as compared with 5,200,000 tons in 1914, which was itself below the average year. The cause of this rests in a serious scarcity of labor. Since the war broke out 4,500 men have enlisted from the workers in the Dominion Coal Company's mines, and of these a bare 1,000 have been replaced, and much of the substitute labor is much below the former standard.

The falling off in the coal output is being felt seriously in Montreal, as ordinarily 2,000 tons are shipped up the River St. Lawrence, and very little has come up this past season. The Dominion Government is alive to the situation and efforts are being made through Senator Robertson, a member of the Cabinet, to provide these men. An increase of wages may be the result, although very recently some action was taken in this direction. The yearly output has not fallen below 4,000,000 tons since 1909.

The record for the past twelve years has been:

| Year. | Tons. |
|---|---|
| 1917 ..... (under) | 4,000,000 |
| 1916 ..... | 5,261,198 |
| 1915 ..... | 4,550,510 |
| 1914 ..... | 5,047,682 |
| 1913 ..... | 5,053,163 |
| 1912 ..... | 4,406,263 |
| 1911 ..... | 4,412,629 |
| 1909 ..... | 2,734,774 |
| 1908 ..... | 3,555,068 |
| 1907 ..... | 3,541,253 |

However, for all the decline in coal, the recent increase in the dividend was not brought into effect on falling earnings.

# NOSING DIES

## *For All Sizes of Shells*

Recently we told in this space of a Nosing Die in use in our own shops which had nosed 35,000 shells, and was still working. This die is still in use, and doing good work.

We now publish the following letter from one of our customers as a further proof of the long life of our CHILLED IRON NOSING DIES.

Messrs. Marsh & Henthorn,
Belleville, Ont.

Gentlemen:—

We have been using your chilled cast iron dies for six months past and they have given us better satisfaction than anything we have yet tried. The die which we are now using has [illegible] to one month and is in as [illegible] as when we first put it in use and we think will last [illegible] more.

We have yet to find [illegible] that we are not willing to pay several times the price, which will give us the same satisfaction.

Yours truly,

[illegible]

We make these Chilled Iron Nosing Dies for the various sizes of Shrapnel and High Explosive Shells, and also for the .75 Millimeter French Shell.

We also make Chilled Iron Sleeves for Forging Billets for the .75 Millimeter Shells.

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## ENGINEERING

main building and the whole eastern wall and roof of the gas house. The boilers and machinery will have to be replaced.

**Brantford, Ont.**—The Massey Tractor Co., of Watertown, Wis., will establish a factory here. The Farmers' Binder Twine Co's. old plant has been secured and will be equipped with machinery for making tractors.

**Kingston, Ont.**—A. MacKinnon, of the Kingston Smelting Co. and E. Chaplin, chemical engineer, of New York, are about to establish a chemical industry in Kingston, in company with several well-known local men. This new Kingston industry will first make barium and soda compounds, such as blanc fixe, which is largely used by paper and paint manufacturers, sal soda, caustic soda, carbonate of soda, and will later go into the manufacture of fertilizer and the extraction of potash.

**Owen Sound, Ont.**—The three large [illegible] Imperial Cement Co.'s plant have been disposed of to a Syracuse soda manufacturing concern, and are being cut in sections for shipment to the company's plant in New York State. The Imperial Cement Co. was the first of the three big cement plants erected here, and large sums were spent in experimenting in various processes. It was taken over by one of the leading bondholders after the town had advanced $20,000 as a loan on a second mortgage. All the other machinery in the plant is included in the sale to the Syracuse concern.

**Bridgeburg, Ont.**—The first steel for the four ships to be built at the yard of the Canadian Allis-Chalmers Co. at Bridgeburg, Ont., has arrived. Practically all the machinery is at hand and is being installed rapidly. It is expected that all four ships will be launched in less than a year. The ships will be of the standard 2,500-ton design of the British Admiralty, 260 feet long over all, just short enough to get through [illegible] to the United States as the result of

**Vancouver, B.C.**—H. T. Tudhope, of [illegible], and W. J. Reece, of Windsor, Ont., are in Vancouver in connection with a scheme to establish an electric smelting plant and steel plate mill in this district. The Hon. William Sloan, Provincial Minister of Mines, will appoint a metallurgical expert to investigate the proposition. The Tudhope interests are behind both the Pacific Steel Co. at Eburne and the Aetna Steel Works at Port Moody, both of which plants are now undergoing change from oil-burning furnaces to electrical furnaces and other improvements to increase their production of steel. Pending the opening up of iron ore deposits which the new furnaces being installed are said to be capable of handling, the two plants are working on scrap material, which is melted and rolled into rods, angle irons and other forms of iron and steel needed in ship work.

## MUNICIPAL

**Guelph, Ont.**—The City Council [illegible] template purchasing additional fire-fighting equipment.

**Midland, Ont.**—Fire Chief John Toole is urging the council to purchase additional fire-fighting equipment, including a motor truck, extension ladders, an electric gong and helmets, etc.

**Hamilton, Ont.**—The United Gas & Fuel Co. has again approached the City Council in connection with the scheme for installing a coke oven plant. It is estimated that the cost would be over $3,000,000.

**Windsor, Ont.**—Local civic officials, backed by the Windsor Gas Co., will send another protest to the Ontario Municipal and Railway Board regarding Wallaceburg and Chatham manufacturers using natural gas in unlimited quantities during the cold weather. They allege that the recent order of the board was violated, and claim that the low pressure in this district during the recent cold snap was due to the drain on the supply caused by the factories.

## TENDERS

**Ottawa, Ont.**—Tenders for telegraph wire will be received until Tuesday, March 5, 1918, for the supply of 30,000 lbs. of galvanized iron telegraph wire delivered at Nelson, B.C.; early dates of delivery desired. Specifications and forms of tender can be obtained on application to the General Superintendent of the Government Telegraph Service, Ottawa, also at the office of the Superintendent of Government Telegraphs at Vancouver, B.C.

**Hamilton, Ont.**—Tenders will be received by the Board of Control up to Monday, March 4, 1918, for supplying the city with the following materials: Castings (ordinary and special), iron pipe, hydrants, valves, extension boxes, hardware, lead pipe, pig lead, road oil, lubricating oil, flux, fuel oil, lumber, gasoline, brass work, including ordinary and special brass castings for the Water Department. Specifications and form of tender for all of the above can be obtained at the office of the City Engineer, Hamilton, Ont.

**Melbourne, Australia.**—Tenders for the following may be addressed to the Director of Navy Contracts, Navy Office, Melbourne: Supply, delivery and erection at Garden Island, of one (1) 200 horse-power prime mover set of either semi-Diesel type or other heavy oil engine direct coupled to 2-65 K.W. 240 volt D.C. electric generating set. All accessories, tank and fittings to be supplied by tenders as per specification. Date of closing, June 7, 1918. Tender forms are open for inspection at the Department of Trade and Commerce, Ottawa. File No. 20117.

**Ottawa, Ont.**—Tenders will be received until March 18, 1918, for heating and ventilating equipment required in the reconstruction of the Parliament Buildings. All tenders to be based on the execution, erection, and completion, together with the furnishing of all materials, tools, appliances, scaffolding, apparatus and labor required for the installation of the heating and ventilating equipment as called for in the plans and specifications. All information can be obtained at the office of the general contractors, P. Lyall & Sons Construction Co., Ottawa. A set of plans and specifications may be had by depositing an accepted bank cheque for twenty-five ($25.00) dollars, made payable to the Honorable the Minister of Public Works, which will be returned if the intending bidder submits a regular bid.

**Ottawa, Ont.**—Tenders will be received until March 18, 1918, for rolled steel casements and bronze-covered frames and sash for the Parliament Buildings. All tenders to be based on the execution, erection and completion; together with the furnishing of all materials, tools, appliances, labor, etc., as required and described by the plans and specifications for (a) rolled steel casement; (b) bronze covered frames and sash. Separate tenders to be submitted for "a" and "b." The work included under this contract shall be commenced immediately on the signing of the same, or at such time as may be directed, and be carried out in such a manner as to insure the completion thereof by Sept. 30, 1918. Plans and specifications and any other infor-

# ECONOMY

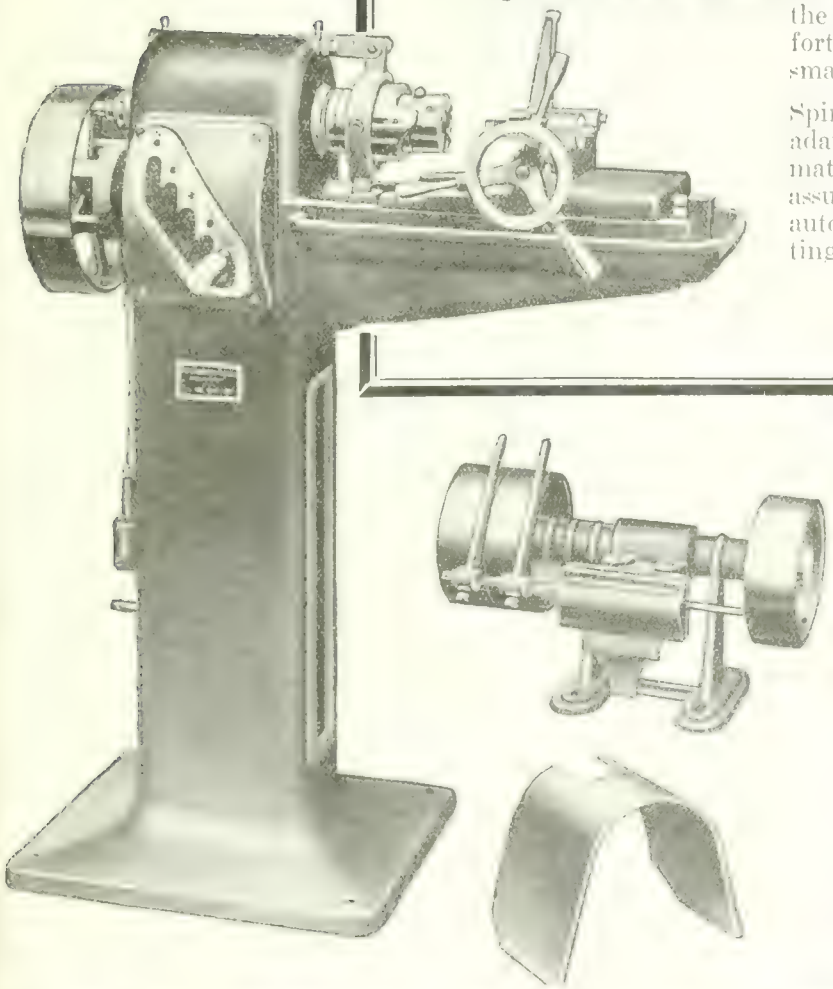
## That is the lesson we are slowly learning

Here is a machine—the Geometric Threading Machine—which has been economizing in screw thread production for a number of years. Busy automatic screw machines cannot profitably be slowed down to cut threads when there is a Geometric Threading Machine at hand. Especially since a Geometric Threading Machine costs one-tenth the price of automatics.

Geometric Threading Machines are employed on a large class of small threaded parts that cannot be produced economically on the ordinary screw machine.

Made in three sizes—to cut $\frac{1}{8}$ to $\frac{1}{2}$ inch, $\frac{1}{4}$ to $\frac{3}{4}$ inch, and $\frac{3}{4}$ to $1\frac{1}{2}$ inch diameter threads. The carriage is mounted on slides and on the largest size machine is moved back and forth by rack and pinion, and in the smaller sizes by hand.

Spindle speed changes readily made, adapting the machine to the diameter and material of the work. An adjustable stop assures accurate length of thread, and automatically opens the die head, permitting of drawing the work straight back.



***A line from you brings full details regarding this machine. Tell us your threading requirements — let us recommend the proper Geometric Collapsing Tap or Self-Opening Die.***

## GENERAL

**Omemee, Ont.** Charles Parsons & Sons, Ltd., 79 Front Street E., Toronto, consulting engineers to their plant here, will cost $100,000.

**Woodstock, Ont.** Henry Bowman, [illegible] Alta., [illegible] to have discovered some valuable beds of marl in Oxford County, and is taking steps to obtain expert examination of them. If they turn out favorably efforts will be made to form a stock company for the purpose of developing the discovery.

**Vancouver, B.C.** The Sidney Rubber Roofing Co., a concern which applied to the city council for a free water supply for ten years, in return for which a factory, involving an initial outlay of $125,000, would be established here, has decided to locate at Port Moody. The company already has an establishment at Sidney, Vancouver Island, where building papers are manufactured from waste paper and other material. In the new factory it is proposed to manufacture tar felt and similar products from old rags and other waste.

## PERSONAL

**Sidney J. Jennings**, vice-president of the U. S. Smelting, Refining and Mining Co., has been elected president of the American Institute of Mining Engineers.

**Fred W. Field**, the newly-appointed Trade Commissioner for Great Britain in Ontario, has received a cable from the British authorities requesting him to take over the duties of his office on April 2 next.

**Capt. Andrew Dunlop**, aged eighty-seven, who was a marine captain from 1854 till 1908, died at Kingston, Ont., on Feb. 20. He was born in Kingston. For many years he commanded steamers of the Richelieu & Ontario Navigation Co.

**E. A. Seath**, formerly with the Montreal office of the Canada Wire and Cable Co., and the Moloney Electric Co. of Canada, has been appointed manager for the Maritime Provinces of these companies, and has opened an office at 674 Barrington Street, Halifax. He is succeeded in Montreal by Harry Riley, formerly of the Toronto office of the Canada Wire and Cable Co.

**S. H. Lunt**, who has been assistant to R. J. Young, general manager at Montreal of the Export Association of Canada for the past eighteen months, is now acting as manager in the temporary absence of Mr. Young, who has been appointed as a member of the Canadian War Board, with headquarters in Washington.

**Major David Seath**, for nineteen years secretary-treasurer of the Montreal Harbor Commission, died at his home, 380 Lansdowne Avenue, Westmount, on Saturday morning. Major Seath was in his seventy-first year and had been a lifelong resident of Montreal. He resigned from the Harbor Board last autumn.

**Capt. James Young**, who went overseas as second in command of the 1st Reinforcing Company, 5th Royal Highlanders, has been wounded in the head and hand, but is doing well. Before enlisting, Capt. Young was employed as manager of the Montreal office for John Bertram & Sons, Ltd., and of the Pratt & Whitney Co. of Canada.

**A. E. Warren**, chief operating officer of the Department of Railways and Canals, has been added to the membership of the administrative committee of the Canadian Railway Association for National Defence. Before his appointment he was assistant general manager of the Canadian Northern Railway, and is described as a railway man of broad experience and marked ability.

**W. J. Sergent**, who, for about eighteen years has been associated with the Allan Line and the Canadian Pacific Ocean services, is retiring from active duty as chief superintending engineer. He remains associated with the company in a consultative capacity. Kenneth MacKenzie, who has been his chief assistant, has now been appointed chief superintendent engineer of all the company's fleets, with headquarters in Liverpool.

**Ross H. McMaster**, assistant general manager of the Steel Co. of Canada, will join the Canadian War Board at Washington, which is being organized by Lloyd Harris to handle Canada's business with United States until the close of the war. Mr. McMaster was connected with the management of the Montreal Rolling Mills prior to the inclusion of that plant in the Hamilton steel combination. He is a director of the Bank of Montreal.

## TRADE GOSSIP

**The Herbert Morris Crane & Hoist Co.** has increased its capital stock from $100,000 to $250,000. The factory is situated at Niagara Falls, Ont.

**The Dominion Bridge Co.**, Lachine, Que., has obtained a large contract for machinery for the British America Nickel Corporation, Toronto. This company is equipping an extensive plant near Sudbury, Ont. The contract includes turbines, turbine blowers, and turbo alternators.

**Bringing Cardiff Coal into Boston.**—Five thousand tons of Cardiff coal was brought to Boston, Mass., last week by a British steamer. The coal, consigned to the British Embassy at Washington, for bunker purposes, was diverted by the British Government to relieve the acute shortage here after it was learned that the British ships held up in New York had been supplied with fuel.

**The Canadian S.K.F. Co.**, of Toronto, announce that they have opened an office in the Board of Trade Building, Montreal, under the direction of Harold Brown, to take care of their expanding business in that district, and also to give a more direct service to users of S. K. F. bearings. Mr. Brown was previously the manager of the J. Stone & Co., in Transportation Building, Montreal, who handle the Stone railway lighting system.

**Dominion Marine Association Meet.**—At the annual meeting of the Dominion Marine Association held in Toronto re-

cently the following officers were elected:—President, J. T. Mathews, Toronto; 1st vice-president, W. J. McCormack, Ste. Marie; 2nd vice-president, G. E. Fair, Toronto; general counsel, Francis King, Kingston. Committee:—A. A. Wright, W. E. Burke, A. E. Mathews, C. E. Harris, J. F. M. Stewart (Toronto), L. Henderson, J. Waller (Montreal), J Sowards (Kingston).

**Ottawa, Ont.**—C. A. Magrath, Dominion Fuel Controller, has returned from the Maritime Provinces, where, in company with J. C. Watters, President of the Trade and Labor Congress, he had been in conference with mine operators and mine workers. The result is a promise from the miners to increase the production of coal in Nova Scotia by at least 12,000 tons per week. An effort will be made to secure 1,000 men from Newfoundland to work in the coal mines of Nova Scotia.

**Tungsten Ore From China.**—U. S. Consul General George E. Anderson, at Hong Kong, reports that shipments of wolframite from the South China field are now proceeding regularly, about 120 tons a month to the United States and about 130 tons a month to Europe. New deposits of the ore are being found in various portions of Kwangtung and Kwangsi provinces, and a deposit covering considerable area has been located in the "New Territory" or mainland portion of the colony of Hong Kong, which is now being developed.

**Secret of the Crucible.**—Another blow to German manufacturers was disclosed in London at the Society of Arts, when Prof. C. R. Darling, expounding high temperature processes and their products, said that the crucibles used had to be lined with special material in order to withstand so great a heat as 3,000 degrees. Formerly all the necessary metals used were produced in Germany and imported, but since the war, owing to the research of our scientists, we had become independent of them. As the result of experiments, 30 metals and alloys of a very useful character were now manufactured in this country.

**Fuel From Garbage.**—The City Council of Guelph has closed a contract with L. R. Long, of the Ontario Oakoal Co., for the construction of a plant in that city. The garbage of the place, with the exception of such non-combustible matter as crockery, glassware, etc., is to provide the raw material, and the plant is to turn out a fuel in briquette form to retail at $7 a ton. The city provides a free site, water and exemption from taxes, excepting for local improvement and patriotic purposes. Mr. Long guarantees to have a capacity of 50 tons per day of his new product.

**Shortage of Pilots At Port of Halifax.** — It is announced in the Canada *Gazette* that owing to the shortage of pilots at the Port of Halifax, due partly to the recent disaster, and the fact that there are at present no apprentice pilots eligible for appointment, power has been granted to the Halifax Pilotage Commissioner to license as pilots any person holding a certificate authorizing him to act as master of a ship, or any apprentice who,

in the opinion of the commissioners is fit and competent. Any license issued under the regulation granting this power to the commissioners shall continue in force until otherwise ordered.

**German Dye Works in England Change Hands.**—Unusual importance is attached to the purchase by Col. Brotherton of Leeds, England, of the big German dye factories at Ellesmere Port, and on the Mersey, England. The Mersey factory was erected nine years ago by the largest group of German color works, consisting of the Badische Aniline Und Sodafabrik, the Farbenfabriken Vorm fr Bayer and Co., and the Actiengesellschaft Fuer Anilinfabrikation of Berlin. It was built primarily to conform with the British patent laws and may be described as representing the most modern ideas and designs in chemical works construction.

**New Stainless Steel on Market.**—A new metal known by the registered name of Bario has been put upon the market by the Bario Metal Corporation, New York, as a heat and acid-resisting material. The manufacturers claim that this is the only commercial metal of its kind that does not rust, tarnish, corrode or deteriorate. It is, they state, non-magnetic and remains clean and bright and is not attacked by sulphuric, nitric or muriatic acids, resembling in this respect gold and platinum. The melting point of Bario is high, beginning at 3,100 deg. Fahr. and increasing according to the grade of metal mixture used. It is manufactured in nine different grades.

**First U. S. Battle-Planes Shipped to France.**—The first American-built battle-planes are en route to France, nearly five months ahead of the original schedule, according to Secretary of War Baker. "These planes," Mr. Baker said, "are equipped with the first 'Liberty' motors from machine production. One of them, in a recent test, surpassed all records for speed and climbing for planes of that type. Engine production, which began a month ago, is now on a quantity basis, and the peak of production will be reached in a few weeks. Only the 12-cylinder type is being made, as developments abroad have made it wise to concentrate on the high-powered engine instead of the 8-cylinder."

**Partial Embargo on Silver Spruce.**—Further regulations have been passed dealing with the exportation of silver spruce. It is now provided "that no railway or other transportation company shall accept any shipment of silver spruce unless the bill of lading covering such shipment is accompanied by a certificate from a well recognized lumber inspection bureau or an association approved by the Minister of Customs that such shipment contains no silver spruce suitable for use in the manufacture of airplanes; provided that this regulation shall not apply to shipment of silver spruce consigned to the Imperial Munitions Board." A railway or other transportation company which fails to comply with the regulations is liable to a penalty of $500.

**Steel Contracts for U. S. War Work.**—Upwards of 8,000 tons of steel plates have been distributed by the Emergency Fleet Corporation among the steel mills, and about 6,000 more tons are required for constructing 18 lake boats which were recently taken over by the Government for service on the Atlantic coast. Specifications are being revised on 50,000,000 bolts and nuts required by the Government, and these will be in the hands of manufacturers in a few days. The American Bridge Co. will furnish 3,000 tons of steel for a number of buildings to be constructed at Atlanta and Baltimore for the Quartermaster Department of the army. Contracts for 100,000 tons of structural steel required for hangars for the British and French as well as the United States Governments are still held in abeyance until it is determined just what time the structural mills can make deliveries.

**Ammonia Shortage Feared for Artificial Ice Making.**—The United States Food Administration issues the following statement: The attention of the Food Administration has been called to articles appearing in various New York papers by which it is indicated that plenty of ammonia will be available to make ice next summer; that there will be no commandeering of ammonia in New York; and that there will be a sufficient supply of the commodity to permit the manufacture of the customary amount of artificial ice. The Government can not give assurance that there will be a sufficient supply of ammonia, nor that the manufacture of the customary amount of artificial ice will be possible. There is danger of a serious shortage of ammonia, and steps are being taken to have as large as possible a harvest of natural ice to meet any possible shortage of artificial ice.

**Boiler Inspection Act Amendment is Proposed.**—Consideration was promised by Hon. F. G. Macdiarmid, Ontario Minister of Public Works, to a deputation headed by J. Leonard, of London, Ont., recently, asking that the Boiler Inspection Act be amended. The act now provides for the inspection of all boilers from the time the plans and specifications are submitted, but unless the boiler requires repairing it is never inspected in the interim, except by insurance companies. The inspection is made by stationary engineers. This is objected to by the manufacturers, as they claim that the stationary engineers are not competent to judge, because of his employment by a company owning the boiler.

**Can Export to U. S. Without Individual License.**—A general order by the War Trade Board, issued at Washington on Feb. 20, permits without individual import licenses, importation of all commodities from Canada, except those mentioned in President Wilson's proclamation of November 28. Importers are urged to make haste in sending in their applications for licenses to import shipments from all other countries.

**Shawinigan Falls, Que.**—The Shawinigan Water and Power Co. will erect and operate a plant for the manufacture of acetic acid for the United States Government. It is understood that work will start immediately on the new plant, which will be a duplicate of the plant owned and operated by Shawinigan

through its subsidiary, the Canadian Electro Products Co. The capital expenditure will be about $2,000,000. T. E. Aldred is president of the Shawinigan Co., and the executive offices are in the Power Building, Montreal.

**Dundas, Ont.**—The Hydro Commission may instal a pumping plant for fire protection for the local sub-station.

**Dundas, Ont.**—The machine shop which Secord and Co. have been building for John Bertram and Sons Co. is almost complete except for some interior finishing. Another contract has been let to the Secord Co. for another shop of brick and steel construction.

**Toronto, Ont.**—Permit was granted last Thursday to the Dominion Shipbuilding Co. to construct a one or two-storey main building at the foot of Bathurst street on the Harbor Commission property at a cost of $175,000. The building will be of steel throughout and faced with hollow tile. The site leased by the company covers about 16 acres, and five shipbuilding berths will be laid down.

**Elk Lake, Ont.**—Most of the machinery for the plant to be erected at the Castle property in Gowganda has reached this point, and will be transferred over the winter road to the property, a distance of about 25 miles. Already large camp buildings are being erected to accommodate the working force, and exploration of the property should be well under way early in the spring. The Trethewey Mining Co. now owns control of the Castle property.

**Cobalt, Ont.**—Plans have been completed for the installation of an oil flotation plant on the property of the Peterson Lake Mining Co. at Cobalt for the purpose of treating the tails which accumulated from the treatment of Seneca Superior. It is estimated that there are about 9,000 tons of tailings, with a silver content of about nine ounces to the ton, or about 72,000 ounces of silver are expected to be recovered from the retreatment of this ore. It is estimated that the cost of installation of the plant will be in the neighborhood of $15,000.

**Nelson, B.C.**—The Consolidated Mining and Smelting Co. is looking into the question of establishing a concentrator at Nelson, primarily for the purpose of treating Silver King ores. No definite decision has been reached, but preliminary plans are being prepared, and experiments are being carried out. If the plant is gone ahead with it will be located near the railway, so that the cost of placing the concentrates on the cars for shipment to Trail, or moving ore from cars brought in from other mines, will be kept down to a minimum. The company has a 400-ton concentrator at Trail, which is reported to be doing good work in the treatment of zinc ores.

**Vancouver, B.C.**—The formation of a $300,000 company to construct a blast furnace in or near Vancouver to test commercially the iron ores and coke of the British Columbia coast, and to produce a supply of pig iron for local markets, is a project which Hugh McLean is now placing before municipal councils, boards of trade and other public organ-

"HAWK" D CHROME VANADIUM STEEL

Will Give You Exceptional

**Shell Forging Production**

WITHOUT AN EQUAL FOR BOTH FIRST AND SECOND OPERATION PUNCHES.

Comes to you heat-treated and ready for use.

It does not stick to the work.

There are many cases where each punch has turned out over 2,000 shells.

It means more shells, per machine per day.

STEEL OF EVERY DESCRIPTION.

...cations of Greater Vancouver. Mr McLean believes that such a blast furnace would prove a profitable investment. He suggests that it would also be a big step towards the establishment of an iron and steel plant. His proposal is that the Provincial Government and the Federal Government each subscribe $100,000, and that the remaining $100,000 be provided by business men of Greater Vancouver.

## CONTRACTS

**Halifax.**—The Standard Construction Co., Metropole Bldg., have the general contract for $16,000 and a $3,000 wharf at Lower Water Street, for the Militia.

**Regina, Sask.**—Smith Bros. and Wilson, of Regina, have been awarded the contract for the T. Eaton warehouse at a price of $395,000. Sub-contracts are not yet awarded.

**Halifax, N.S.**—Bate, McMahon & Co., Ottawa, have the general contract and will let plumbing and electrical work for military huts, costing $250,000, for the Department of Public Works, Dominion Government.

**Brantford, Ont.**—The following contracts have been awarded in connection with the erection of a boiler house, etc., costing $10,000, for the Dominion Steel Products Co.. General contract, P. H. Secord & Sons; structural steel, Hamilton Bridge Works; boilers, Waterous Engine Works, Brantford.

**Kingston, Ont.**—President J. J. Harty, of the Canadian Locomotive Co., announces that the company has received an order from the Department of Railways and Canals, Ottawa, for six six-wheel switch locomotives and four narrow gauge, 10-wheel locomotives for the Prince Edward Island Railway, delivery to be made in June next.

## MARINE

**Vancouver, B.C.**—The War Puget was launched at the Lyall shipyard, North Vancouver, on Feb. 16, the christening ceremony being performed by Mrs. E. H. Bridgeman. The vessel is being built for the Imperial Munitions Board. The War Puget is a wooden steamer, and has the following dimensions:—Length between perpendiculars, 250 feet; beam moulded, 42 ft. 6 inches; depth moulded, 25 feet; draught, 22 feet, and deadweight capacity on 21 feet maximum draught, 2,800 tons. She will be equipped with a triple expansion engine developing 1,000 i.h.p.

## INCORPORATIONS

**Aurora Foundries Ltd.**, have been incorporated at Toronto with a capital of $40,000 to manufacture iron, steel, and brass castings of all kinds at Aurora, Ont. The provisional directors are R. A. Fraser, R. H. Noble, and G. W. Johnson, all of Toronto.

**Atlas Wooden Ware, Ltd.**, has been incorporated at Ottawa with a capital of $50,000 to manufacture articles of all kinds made of wood. The head office is at Montreal, and the incorporators are P. S. and Edward Holley, and A. R. W. Plimsoll, all of Montreal.

## WOODWORKING

**Kelowna, B.C.**—S. M. Simpson has taken over the Kelowna Canning Co.'s plant, and will convert it into a sash and door factory.

**Peterborough, Ont.**—Fire last Saturday destroyed the Peterborough Planing Mill. The stock and property loss is estimated at about $10,000. Spontaneous combustion was given as the cause. The company was manufacturing shell boxes, and a considerable quantity of shell-box machinery was destroyed. Loss is covered by insurance.

## RAILWAYS

**Toronto, Ont.**—The car barns of the Scarboro' division of the Toronto & York Radial Railway, at 766 Kingston Road, were gutted by fire on Sunday, causing a loss of $70,000. Four large radial cars are included in the loss, which is fully covered by insurance.

### TRADE INQUIRIES

THE following trade inquiries have been received by the Department of Trade and Commerce, Ottawa. Further particulars may be obtained on application:

82. **Electrical equipment.**—A firm in Florence, Italy, which furnishes electrical supplies to Italian companies, wishes to get into communication with Canadian manufacturers of electric lighting equipment, contact breakers and electrical heating supplies.

83. **Caustic soda, resins, etc.**—An Italian firm in Bari, on the Adriatic Sea, makes inquiry for caustic soda, silicate of soda in crystals and resins (colophony).

84. **Manufacturers of iron and steel, chemical products, wood-pulp, men's and women's hosiery.**—A Florentine firm would be glad to hear from Canadian houses disposed to export to Italy wood-pulp, manufactures of iron and steel, chemical products and men's and women's hosiery.

85. **Chemical products.** — An Italian firm in Bologna with established connections for the sale of chemical products would be pleased to enter into negotiations with Canadian exporters of phosphates and superphosphates, sulphate of copper, potassium salts, seed oilcake, dry blood and other animal residue, etc.

86. **Grain, leather, tallows and soap-making chemicals.**—A Catania firm would be pleased to hear from Canadian shippers of grain, chrome-tanned leather and of such chemicals as the following for soap manufacture: Caustic potassium, carbonate of potassium, carbonate of soda, and caustic soda. Tallows are also asked for.

88. **Metals, wire, beams and shovels.**—A firm in Florence with Italian Government connections and branches in Bologna and Leghorn is disposed to treat with Canadian manufacturers of copper and brass in small tubes or sheets, copper wire, antimony, nickel, zinc, shovels, iron beams for construction purposes, iron wire and brass wire.

### CANADA FOUNDRIES AND FORGINGS CO.

AT the sixth annual meeting of the Canada Foundries & Forging Ltd., held in Montreal last week, the president W. M. Weir in his address said:

"Your plants have continued to operate at full capacity. The heavy expenditures of past years in improvements and enlargements have been fully justified, as evidenced by the net earnings for the year in the face of heavy rises in labor and material costs and reductions in munitions prices. Your normal business has shown favorable increases and every effort has been made by your Board to keep fully abreast the times in order to model and remodel the operations and business to meet the rapidly changing conditions arising out of the great war.

"During the past year heavy demands for marine forgings were made upon your company, and in order to take the fullest advantage of the opportunity offered, your directors purchased the total issued capital stock of the Delaney Forge and Iron Co., Incorporated, of Buffalo, one of the oldest established ship forging industries of the United States. This purchase was duly ratified at a special shareholders' meeting held at Brockville, 10th October, 1917. The acquisition of this plant materially assisted your Canadian plants in the immediate participation of this new line of industry, and further developments are now proceeding to enable your company to take still fuller advantage of this business.

"There have been booked sufficient orders to keep your company fully employed for some months ahead and, although your directors are still unable to predict the future prospects, they look with confidence to the results of 1918."

### EXPORT LICENSES TO CANADA AND NEWFOUNDLAND

TO facilitate exports from the United States to Canada and Newfoundland there has been heretofore issued through the U. S. Customs service a special license whereby goods have been permitted to enter Canada and Newfoundland without an individual license for each shipment, except in the case of commodities which the War Trade Board has heretofore found it necessary to conserve, and for whose exportation individual licenses have been required, as stated in the several announcements made by the board from time to time.

The War Trade Board announces the publication in the "War Trade Journal," No. 4, of a revised list of such commodities which will hereafter require individual export licenses when exported to Canada or Newfoundland. Any commodity appearing on this revised list which hitherto has not required an individual license when exported to those countries will be passed by the Collectors of Customs in the same manner as heretofore when the shipment is covered by ocean or railroad bill of lading marked "For export," and dated on or before January 25, 1918.

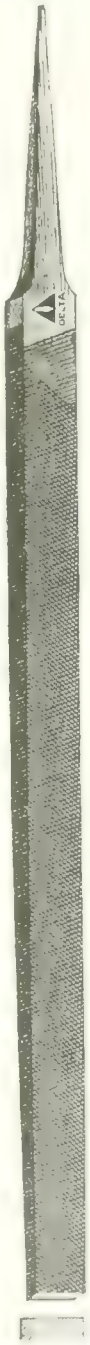
HOW to tell a GOOD File by the tang



First, understand what we mean by "good." For an ordinary file may, for a time, do fast work on soft material. A file, to be what we term a *good* file, however, must do fast work on the hardest, the toughest material, and continue to do it long after the teeth of a common file would be worn smooth. A file made of

Crucible Steel

is the only file able to retain sharp cutting teeth against hard metal.

Therefore, only a crucible steel file meets our idea of a good file.

There is but one line of files from 3 to 24 inches made absolutely of crucible steel, and they're backed by 50 years of file-making experience. You can tell them by this trade-mark on the tang

(Continued on page 166.)

*No better illustration of the potentiality of Canada can be offered than that of her mineral resources. While the glamour of enormous wealth will always attract attention to gold and silver deposits, the attention of students of world progress is frequently more interested in discovery and research surrounding of alchemistic mystery. The substance which has prompted this article is of the latter category.*

FROM time immemorial, the noble metals have exercised a fascination over mankind, the length of the spell being only equalled by the completeness with which it has influenced national and individual actions in all stages of the world's history.

In progress of time, however, the absolute values of metals to mankind have undergone more or less readjustment. Intrinsically and individually, gold, silver, etc., may be of more immediate monetary value, but in the industrial or utilitarian sense, iron and steel are much more indispensable to the welfare of the human race than are the previously named noble metals. The pre-eminence of gold down through the ages, while due principally to its imperishability and attractive appearance, has also been due in part to its being obtainable in the raw state without requiring much treatment in the way of refining, until the demands of modern commerce caused effort to be made to recover all of it.

### Cobalt a Canadian Metal

The developments of modern metallurgical science in allied fields soon resulted in the commercial production of certain semi-rare metals which, while not competing with gold or silver as bases of currency, still possessed a high value, although their industrial applications were more or less limited at first. Prominent among such metals is cobalt. It is semi-rare in the ordinary sense of the word, its deposits are practically confined to Canada, and, along with chromium, etc., it is destined to play an increasingly prominent part in the world's future industrial development.

Stellite, one of the marvels of modern research, is a non-ferrous alloy of cobalt and other metals. Its value as a machine shop accessory material has been well proven during recent years, it having certain qualities which adapt it for use in place of high speed steel as a cutting agent. In view of its unique properties and the fact that the humblest machine operator has frequently had his earnings largely increased through its use, more than ordinary interest attaches to the plant where this metal is produced, and the views and description of processes forming this article were obtained through the courtesy of the Deloro Smelting and Refining Co., Deloro, Ont. This company operates a smelting plant which refines silver-cobalt-nickel ore from the O'Brien mines at Cobalt and Gowganda.

### Smelting Plant

The smelter is located on the site of an abandoned gold mine, which has not been worked for the last twenty or thirty years, and, as some of the refining operations carried on at present have much in common with those by which the gold was formerly recovered, certain portions of the old plant have been retained and are incorporated into the present smelter.

Cobalt is only found in commercial quantities in Canada, and since the company, in addition to the manufacture of stellite for the Canadian and export trade, also refines the cobalt used in the manufacture of stellite in the United States, it will be of interest to [illegible]

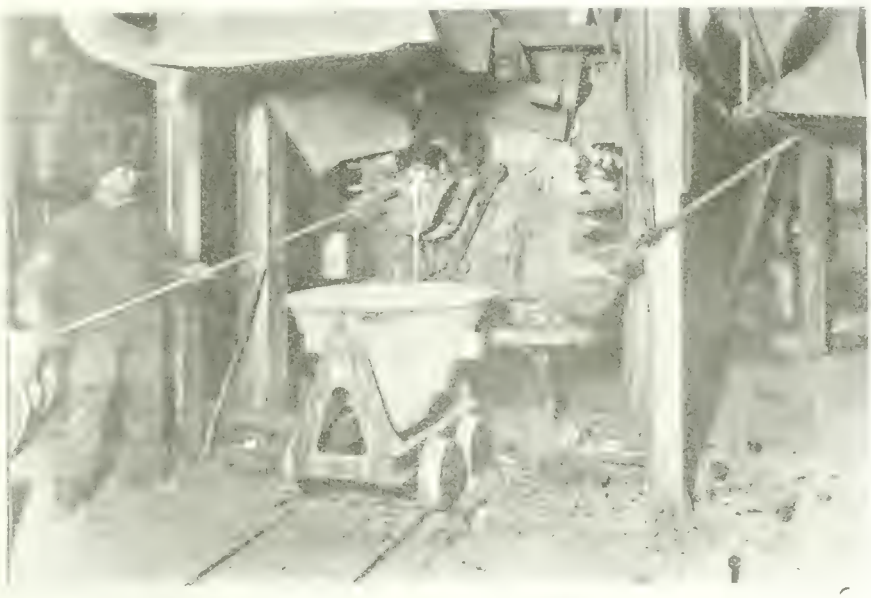

FIG. 1. SLAGGING OFF SILVER FURNACE

[illegible] nickel ore.

[illegible] above is first ground in ball mills to the [illegible] assaying and the bulk of the material going into storage bins.

From the storage bins the ore passes to blast furnaces where coke and the [illegible] are added. These furnaces are of a design suitable for the material handled and are somewhat similar to those used in the reduction of copper ores. The products of the blast furnaces are, arsenic fumes, which pass to bag-houses for collection, slag which is dumped, and speiss which contains the cobalt, nickel, silver and some iron and copper. In addition [illegible] is recovered at the blast

FIG. 1. TAPPING SILVER FURNACE

furnace as base bullion and goes direct to the silver refining furnaces. Fig. 1 shows the slagging off of the blast furnace preparatory to the tapping off of the speiss, shown in Fig. 2.

The speiss is given a further treatment of crushing and roasting to drive off the remaining arsenic; chlorodizing and cyaniding, the result of which is the freeing of silver in the precipitated state and the leaving of the other metals in the residue.

### Silver Refining

This precipitated silver is then taken to the bullion furnace room, where it is graded with the base bullion, refined, and finally melted for pouring into ingot molds, as shown in Fig. 3. This furnace is of the Swartz oil burning type, provided with trunnions and a geared tilting arrangement. In all about 150,000 troy ounces of silver are refined each week.

FIG. 3. POURING BULLION IN THE SILVER REFINING PLANT.

The arsenic fumes given off at the blast furnace are carried to cooling chambers, where the crude arsenic partially settles out, the remainder being led to bag houses, where it is completely removed from the blast furnace gases. The crude arsenic is periodically removed from the bag houses and chambers, and is charged to the arsenic refining furnaces, where it is again volatilized and passes into the white arsenic chambers in which it is condensed and from which it is packed for shipment.

The residues left after extracting the silver form the source of supply for the cobalt oxide plant. In this plant the cobalt and nickel oxides are produced and shipped to England, France, United States and Japan. The operations in this department are purely hydro-metallurgical; in other words, it is a wet plant.

The residues are first processed in such a way that the metal content is rendered soluble. The next step in the process is the removal of the copper and iron, the solution being then ready for the precipitation of the cobalt and nickel. The tanks in which these operations are carried on are shown in Fig. 4, which also shows the filter presses used for dewatering the precipitated sludge. The cobalt and nickel are precipitated separately and the clear solution finally remaining is allowed to run to waste, as it contains no values.

The press cakes of cobalt and nickel are dried and treated for the removal of sulphur, after which they are refiltered, dried again, ground and packed ready for the market. Fig. 5 shows the Raymond grinding and packing machines by which the cobalt and nickel oxides are prepared for shipment. All material is carried through these machines by a

FIG. 4. COBALT OXIDE PLANT: STRIPPING FILTER PRESS.

pneumatic system, the details of which will be understood by reference to Fig. 5.

**Stellite and Metals Department**

The metals department derives its supply of raw material from the oxide plant. The oxide is first reduced and is then charged into the electric furnaces where it is melted, the procedure for cobalt and nickel being similar. The form in which these metals are prepared for the market is similar to shot, and for cooling of the molten metal in this form an ingenious device is used which breaks up the molten stream from the pouring ladle into small particles not necessarily round. This device, which is shown in Fig. 6, consists of a circular tank 4 feet in diameter by about 6 feet deep. The 1½ in. pipe shown has two flat nozzles, above the tank waterline, through which water is forced at a high velocity. These jets serve to break up the molten metal into particles of the desired size. The metal in shot form is caught by a basket or screen in the bottom of the tank and is removed, after the melt is finished.

FIG. 5. PACKING COBALT AND NICKLE OXIDE.

Cobalt in shot form obtained in the above process forms one of the principle ingredients of stellite, and it, together with the proportions of chromium and tungsten for the different grades of stellite, is placed in the electric furnaces used for stellite manufacture. These furnaces, shown in Fig. 7, are of the Snyder type and are of 50 K.W. rating. The Snyder electric furnace has a vertical 3 in. carbon electrode mounted in the center above a magnesite hearth, with means for its manual raising or lowering to suit the depth of charge and for the adjustment of the electric current.

The furnace is started by striking an arc, and the heating takes place by the utilization of the resistance of the charge as well as by arc action. In operation these furnaces take from 80 to 100 amperes at 50 volts, single phase.

In this connection mention might be made of the furnace in which stellite was first produced in Canada. This furnace, which is still used for experimental and research work is shown in fig. 8. It is single phase and it will be noticed that two carbon electrodes are provided, the arc being struck through the material on the hearth. A double throw switch is provided, by means of which voltages of either 50 or 100 may be impressed between electrodes. This furnace is of 25 K.W. capacity and the increased demand for stellite in the past two years has necessitated the building of the two 50 K.W. furnaces now used for stellite alone.

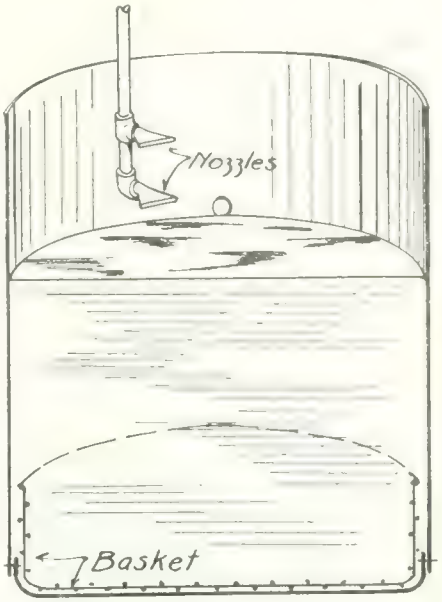

FIG. 6. METAL SHOTTING TANK.

**Pouring**

When the charge is melted the furnace is tipped forward on its trunnions, and the molten stellite is poured into a graphite crucible from which it is poured into the graphite moulds. Stellite has a high melting point, about 1,900° C (3.452° F), and considerable care must be taken to skim off all slag and foreign matter.

An interesting device, shown in Fig. 7 facilitates the pouring operation. The

FIG. 7. MOLTEN STELLITE AT A TEMPERATURE OF 3,700 DEG. F. BEING CAST IN GRAPHITE MOULDS.

are firmly fastened to a circular frame made of flat and angle iron, the angle iron forming a ledge for the bottom of the molds. This frame is carried on wheels running on a circular track in the floor, and enables the operators who are pouring to stand in one place and serve the molds as they are brought around to the proper position.

### Mould Shop

The mould shop is in many respects similar to the average machine shop or tool room, most of the tools being required for the cutting up of graphite slabs into the various shapes required for the graphite moulds. The slabs are first sawn into the required sizes on a band saw and are then shaped on a 20 in. Kelley shaper to a contour which will give the proper cross section when the halves of the mold are clamped together.

FIG. 8. EXPERIMENTAL AND RESEARCH FURNACE.

A 15 in. gap lathe and an 18 in. MacKenzie lathe form part of the equipment.

When the stellite has cooled sufficiently the molds are taken down and the bars removed, fins and sprues being broken off. In the next operation the bars are [illegible] cutter and broken into the required lengths.

This cutter, shown in Fig. 9, consists of a stand of box section, carrying bearings and a horizontal shaft, on one end of which a disc of steel 1-16 in. by 16 ins. in diameter is mounted between two [illegible] x 14 in. covering plates. The stellite bars are brought into contact with the [illegible] a ledge on its upper surface for engaging the bar. The actual nicking is not effected by a cutting action but by the heat generated through the friction between the rapidly revolving disc and the stellite. This heat is so great that the metal is melted at the point of contact and the disc consequently has only to remove the molten metal, and by so doing clears the dividing groove.

As the greater part of the steel disc is at all times out of contact with the metal and is being continuously cooled by contact with the air, and as each point on its circumference is only in contact with the metal for a minute fraction of a second during each revolution, the disc remains at all times comparatively cool and does not melt. After the bars have been nicked and broken to length they are ground and polished on the grinders, also shown in Fig. 9.

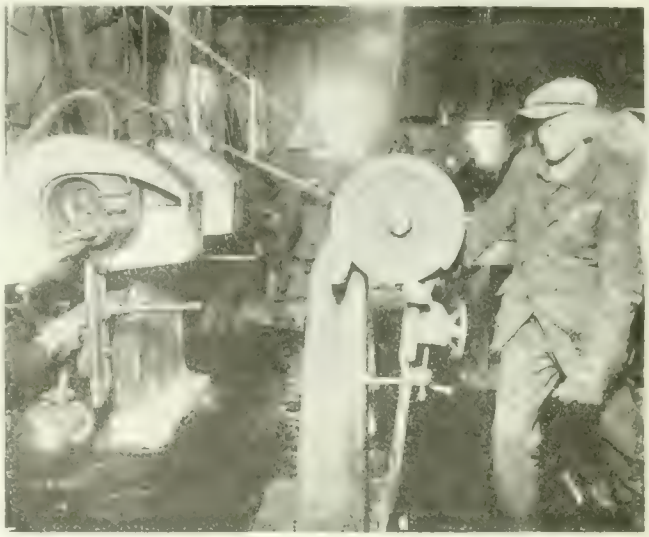

FIG. 9. CUTTING STELLITE BARS WITH STEEL DISC

### Inspection and Packing

A test bar is taken from each melt and is tried out and tested on a test lathe where the quality as regards speed and depth of cut is determined. Each melt also undergoes a sceleroscopic test and is subjected to laboratory analysis.

### Qualities

Stellite cutting alloy requires no tempering, no cutting compound, and may be used at a speed that would be impracticable for high speed steel, best results being obtained when working the tool at a red heat.

The following table gives the surface speed at which stellite should be used, the same depth of cut and feed being maintained as for high speed steel.

| Material— | Surface Speed per Min. |
|---|---|
| Mild steel to 30 pt. carbon | |
| Use No. 1 grade stellite . . . . | 130 to 300 ft. |
| Hard steel, 30 to 100 pt. carbon | |
| Use No. 1 or 2 grade stellite... | 100 to 200 ft. |
| Soft cast iron | |
| Use No. 2 or 3 grade stellite... | 200 to 350 ft. |
| Hard cast iron | |
| Use No. 3 grade stellite . . . . | 100 to 250 ft. |

### Forms and Shapes

The manufacturers recommend personal demonstration and instruction in order that the best results may be obtained and the proper methods used.

In addition to the usual square and flat sections a variety of special shapes are made, a few of which are shown in figs. 10 and 11. The circular cored section shown in Fig. 11 is made specially for a Canadian manufacturer and is held in a special tool holder in such a manner that when one portion of the cutting edge becomes worn the bit may be turned in its holder, presenting a new portion to the work. When the whole edge becomes dull the bit is ground off until the edge is even all around its circumference, and a conical wheel is then used to bring this new edge to sharpness.

In the smaller sizes formed cutters are made of solid stellite, being ground to the correct contour from the rough. This method is not so economical for the larger sizes, and built up cutters are preferred when the width exceeds ¼ in. These cutters are made with a corbon steel body and inserted blades of stellite, thus obtaining the strength of steel and the cutting powers of stellite. The inserted teeth may be held in place either by the usual method or by welding.

Stellite is fabricated into tool bits by welding a stellite tip on a machine steel shank. For this work either electric-arc or oxy-acetylene welding may be used with good results.

### Electrical Installation

Electrical energy for the electric furnaces and all other plant requirements is obtained from the Seymour system of the Hydro-Electric Power Commission of Ontario. The smelter receives power through a 3 phase 60 cycle 44,000 volt transmission line, which enters the substation through wall bushings on the second floor. The accompanying cross-sectional elevation, Fig. 12, of the sub-

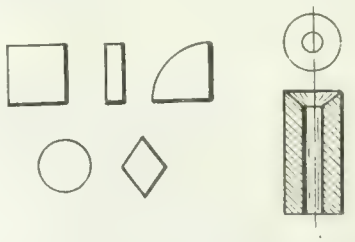

FIG. 10. USUAL STELLITE SHAPES.
FIG. 11. SPECIAL SHAPE.

station will serve to show some of the interesting features of this installation.

The building is of fireproof construction with hollow concrete block walls, and with steel and concrete floors and roof. The upper floor is used for a lightning arrestor and high-tension switch room, and the lower one for transformers and switchboard.

The electrical installation is protected by a set of General Electric type I electrolytic lightning arresters provided with

disconnecting switches for their isolation when being worked upon. From the line entrances the leads pass through choke coils and disconnecting switches to the General Electric type K high-tension oil switch. This switch is enclosed in a concrete cell and is hand operated from the switchboard on the floor below.

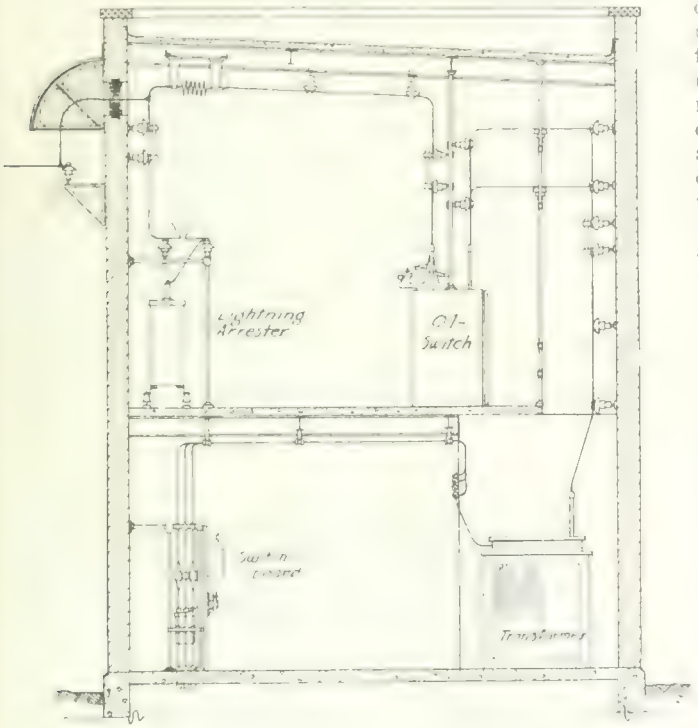

FIG. 12. CROSS SECTION OF SUBSTATION

The transformer equipment, consisting of three Westinghouse single phase 250 K.W. 44,000/600 volt 60 cycle transformers in separate concrete compartments, Fig. 13. These transformers are delta connected on both high and low tension sides, and the high tension side is provided with disconnecting switches by means of which any transformer may be cut out of service and the other two operated on open delta when the secondary side is opened as well.

The three panel switchboard is equipped with a C. G. E. type F form K 2 600-volt 1,000 amp. oil switch on the secondary side of the transformers, from which the single, three-prase feeder passes underground to the company's pole line for distribution to the plant. Both the high and low tension switches are provided with C. G. E. inverse time limit relays. A Westinghouse graphic recording wattmeter meters all the plant load, a Westinghouse type E integrating wattmeter being also provided. A General Electric horizontal edgewise ammeter with ammeter plugs and a similar type voltmeter on a swinging bracket are part of the equipment.

### Laboratory

A laboratory, with all the various apparatus necessary for the control of operations in a metallurgical plant of this character, is housed in a separate building by itself, and it is in this building that all the assaying of ores and other necessary control testing is carried out.

For this purpose a furnace room is provided where all cuppellation of the ores is carried out for the determination of their silver content. The rest of the laboratory is divided off into separate sections such as the office, hydrogen sul- for sulphur deter- room with four chemical balances and an office for the chief chemist. Two wet rooms, where general chemical analysis is carried out are also part of the laboratory, and an interesting portion of one of them is shown in Fig. 14.

The piece of apparatus shown in this illustration is for the determination of cobalt and nickel in the sampling of ore and furnace products by electro-chemical analysis. Four glass beakers containing known quantities of the solutions to be analyzed are placed on stands under the rotating glass rods. These rods are rotated by a motor, as shown, for the purpose of securing a faster deposition of the metals through the stirring of the solution. After the required metal has all been deposited out of the solution it is a simple matter to determine the various proportions of the metals present in the materials tested.

## STELLITE AND SOME OF ITS USES

WHILE stellite has come prominently before the engineering industry as a cutting material, its present applications are not limited to tool work, while increased supply and experience in its manufacture are expected to disclose further uses and additional alloys. In a recent article in the "Canadian Chemical Journal" the discovery and development of stellite and the circumstances attending its production in Canada are recounted by Thomas Southworth,* who writes as follows:

In 1910 a business correspondent of Swansea, Wales, in writing us regarding Cobalt matters, enclosed a clipping from an English paper that he thought would be of interest to the writer. This clipping was a reproduction of an article that had appeared in an Australian paper referring to an address made by a Mr. Elwood Haynes, of Kokomo, Indiana, before a chemical society in San Francisco. As the article in question stated that Mr. Haynes had discovered a new alloy of cobalt, it naturally was of interest, and I made inquiries as to Mr. Haynes through a friend in Kokomo. I then got in touch personally with Mr. Haynes, who had been anxious about a supply of cobalt, with the result that he came to Toronto, and Mr. Haynes and the Deloro Smelting and Refining Company linked up together in the development and production of the alloy.

Up to this time cobalt, which had been known for centuries, had been produced mainly in the form of an oxide and used almost exclusively in the ceramic arts. Originally found in Saxony and subsequently in limited quantities in New Caledonia, the large production from the cobalt silver mines flooded the market, and cobalt oxide was at that time un-

*Managing Director [illegible] ing Co., Ltd., Toronto.

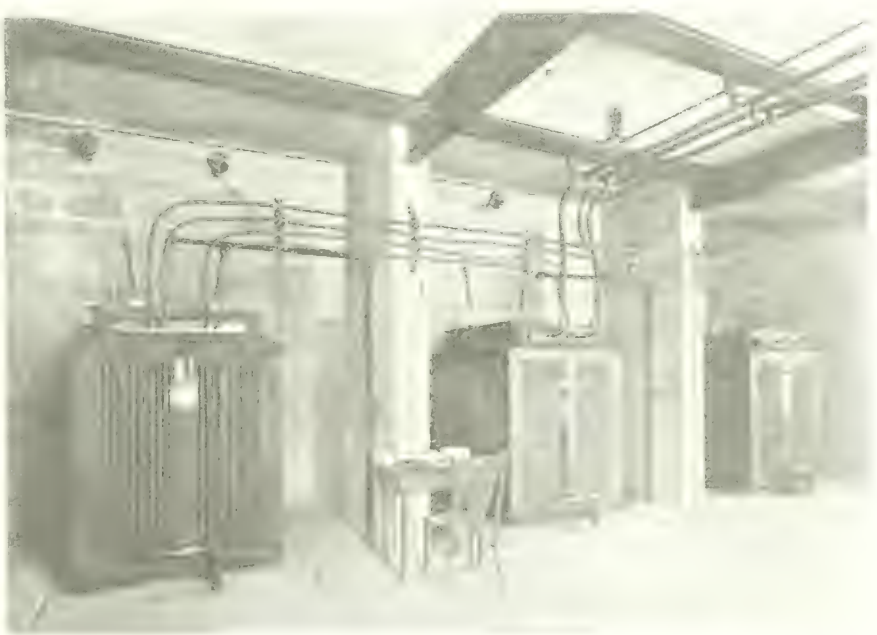

FIG. 13. TRANSFORMER ARRANGEMENT IN SUBSTATION.

[illegible] except in comparatively small quantities. Naturally, therefore, any new [illegible] that was likely to produce new uses for cobalt would be of interest to the Deloro Smelting and Refining Company, one of the largest producers of cobalt in the world.

On meeting Mr. Haynes I found that he was not only a metallurgist, but an inventor and manufacturer, who had to his credit the production of the first practicable gasoline motor car in the United States, and was then manager of the Haynes Automobile Company, makers of a well known car.

In his spare time Mr. Haynes devoted himself to metallurgical research, and as a result of numerous experiments he found that cobalt, although apparently similar to nickel, possessed quite different qualities in many ways, and at the time his paper on "Cobalt Alloys" was delivered he had produced an alloy of cobalt and chromium that bade fair to supersede steel for some purposes. This alloy Mr. Haynes called "Stellite," for the reason that when polished it took on a particularly brilliant lustre, hence the name "Stellite."

In addition to its brilliant color, which made it a very attractive looking metal for cutlery purposes, it was stain-proof and rustless. Stellite alloys resist oxidation or tarnishing better than any known metal excepting gold and the metals of the platinum group. It is absolutely immune to all alkaline solutions, and practically so to all chemical salts, including solutions of bichoride of mercury, iodine, etc.

Mr. Haynes states that a stellite bar was subjected to the action of strong, cold hydrochloric acid for thirteen days with a loss of .009 grams. The action of dilute sulphuric acid is slightly more pronounced. Nitric acid has no effect on the metal whatever. Fruit juices and acids do not discolor stellite, even though allowed to dry on the polished surface.

### Physical Properties

In point of hardness, the binary alloy, consisting essentially of cobalt and chromium, can be forged with difficulty at a bright red heat, but when it becomes cool, its hardness remains as great as before the first heating. The metal is somewhat stiffer than steel, and notwithstanding its great hardness, it still shows considerable elongation. The alloy can be made in great variety of hardness and toughness, not only by changing the proportion of its constituent metals, but by adding small quantities of other metals. By this means untarnishable alloys can be made which vary in hardness from about that of common, untempered steel, to that of quartz crystal. In fact, one of our stellite alloys is so hard that it will readily scratch the hardest and toughest steel ever produced. The unique and peculiar properties of stellite alloys may be summed up in the statement that the alloys combine a greater range of hardness than steel, with the resistance to oxidation of platinum and gold.

The original stellite produced in Kokomo and at Deloro, and intended for cutlery purposes, was found on being tested in Sheffield, England, by cutlers that, although the metal possessed many excellent qualities in the way of appearance and freedom from stains, it was so hard as to be—while not entirely unworkable, so nearly so as to be impracticable for the purpose. Mr. Haynes at once set about developing other alloys, and about two years ago produced a stellite used as a metal cutting tool, and this material, manufactured in Kokomo, Indiana, by the Haynes Stellite Company, and in Canada by the Deloro Smelting and Refining Company, has proven a very great success. It is quite generally in use in the United States, Canada, Great Britain, France and Italy, and there is no doubt that its use in Canada has to a very considerable extent been instrumental in increasing the output of large and small shells in our Canadian factories. The material does not lose its temper even though heated to a white heat, but retains its cutting qualities under these conditions. This makes possible a much greater cutting speed than can be obtained with any other metal, hence the increased output by the use of stellite.

Mr. Haynes has more recently developed a new alloy called Festal Metal, being a combination of stellite and iron, that will shortly be placed on the market for cutlery purposes. This metal has all the non-rusting and non-staining qualities of the original stellite, while it is much more malleable and possesses a greater elasticity than the original alloy. He has further produced a malleable stellite, which is to some extent taking the place of platinum in laboratory appliances, as well as for other purposes.

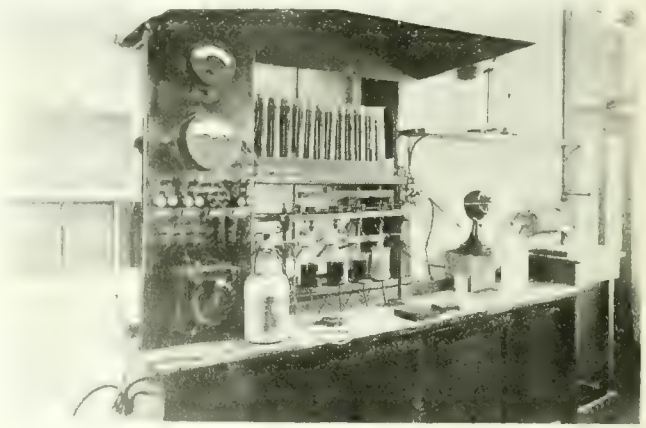

FIG. 11 ELECTRO-PLATING OUTFIT USED IN ELECTRO-CHEMICAL ANALYSIS.

The present writer not being a technical man is unable to give other than a general statement of the various stellite alloys and their uses, but the following from a paper recently read by Mr. Haynes will give a better idea of the nature and character of these alloys.

### Practical Applications

First, it may be said that these alloys are not fixed or definite in their composition, and may be divided broadly into two classes: (1) those malleable at a red heat; and (2) those which can be worked into the desired form only by casting.

The malleable alloys are composed almost entirely of cobalt and chromium only, though the proportion of the constituents may vary from 10 to 50 per cent. chromium, with a corresponding variation in the cobalt. These alloys are all hard, and while they may be scratched by the file, none of them is practically workable by this means. They cannot be machined, but some of the softest ones may be drilled by means of a hard-carbon steel drill or a drill composed of hard stellite. They resist nitric acid almost perfectly, even when boiling, particularly if the chromium content is over 15 per cent. They forge with difficulty at temperatures ranging from 750 to 1,200° C.

They have been forged into the following forms:

(a) Tableware, such as spoons, forks, knives, ladles, etc.

(b) Surgical instruments, pocket knives, dental instruments, etc.

(c) Evaporating dishes, crucible supports, lamp stands, etc.

(d) Jewelry, including finger rings, cuff buttons, scarf pins, etc.

These malleable alloys are all slowly attacked by either hydrochloric, sulfuric, or hydrofluoric acid, but are nearly immune to all chemical combinations, as well as the fruit acids. As the evaporating dishes made of this metal take a bright polish, and can be made of comparatively light section, they will prove suitable for evaporating many chemical salts to dryness, and are particularly suitable for boiling the caustic alkalies. Substances may be evaporated to complete dryness in these vessels without any danger whatever of breaking the vessel, since the tensile strength of the alloy exceeds 100,000 pounds to the square inch, and it also shows considerable elongation before rupture. When a vessel made of this material is struck by a hammer, it emits a clear, musical tone, and continues to vibrate for a considerable length of time. The vessels retain their lustre in the chemical laboratory under practically all conditions, since they are not affected in the slightest degree by sulfuretted hydrogen, ammonium chloride, or other vapors. Furthermore, they are practically immune to acid vapors. They give most excellent results in the form of lamp stands, supporting rings, triangles, etc. When these are heated to full redness, they become covered with a deep blue-black film, which does not change either in weight or appearance by repeated heating, and as no scale ever forms, these articles retain their weight, stability, and smooth surface indefinitely under all sorts of use. They can be subjected to temperatures up to 1,200° C., and still retain a considerable amount of strength. In

fact, the stellite alloys possess the highest "red hardness" of any of the alloys yet discovered.

### A Canadian Product

While stellite was discovered and developed by an American, the alloy may be considered as distinctly Canadian. All the stellite so far manufactured has been made from Canadian cobalt, and, as is generally known, Canada possesses the largest supply of cobalt at present known, and this position will likely be maintained for some time. Until the deposits of this metal at Cobalt were opened up very little incentive existed for research work in this line owing to the scarcity of the metal and its very high price. Cobalt had for years varied from $4.50 per pound of oxide to $2.50 per pound, which was the price obtaining when the Cobalt camp was opened. The price very quickly dropped to 75 cents, and without sufficient market to absorb the output of the Canadian refineries.

The first alloy of consequence that has so far been discovered is stellite, but no doubt the reasonable price of this metal, and the increasing supply will induce investigations that will disclose new uses and new alloys. One of these new uses is for a light weight metal to replace the household utensils imported hitherto from Hungary.

It may be stated that cobalt is being used to a limited extent in the production of the better grades of high-speed steel.

## THE RETURNED SOLDIER AND INDUSTRY

BY no stretch of the imagination could anyone apparently conceive of greater problems than those with which the various national governments are confronted at the present time in the stupendous task of waging a war, the equal of which has never before been experienced in the history of mankind. It is small wonder that mighty men, of marvellous mental ability and physical accomplishments, endowed with almost miraculous stamina for achievement, have risen to great power and influential position, and, after a period of brief or prolonged administration, have been superseded by others, fresh for the fray.

With the world conflict still at its height, it seems premature to dwell on the possible developments that will undoubtedly arise when peace is finally declared and the nations take a breathing spell before resuming the task of supplying the needs of a normal and sane humanity. While it is certainly obvious that the successful solution of war problems requires the concentrated, and oftentimes superhuman efforts of the executives, in whose hands lies the destinies of nations, it is prophetically true that the period of commercial and industrial, as well as social, readjustment that must inevitably follow in the wake of such a devastating war, will create unprecedented conditions requiring the closest co-operation of statesman, manufacturer and employee, both individually and collectively, for their satisfactory settlement.

One of the most important, if not the all-essential problem of the immediate post-war period, will be that of the returned soldiers. Already this question is receiving the attention of many interested parties. Much has been accomplished, and still greater plans are being considered for absorbing these men into the normal channels of the country's future activities. The problem is not so much that of the man who has been fortunate enough to pass through the turmoil of the eventful past and return again with all his mental and physical abilities—as these men, in most instances, will be able to look out for themselves but rather with the great number of men, temporarily or permanently disabled, who must rely on the honor and goodwill of those fellow citizens for whom this great sacrifice has been made. The care or employment of these men must not be considered as a charitable undertaking, but as a moral obligation on our part to which these men are justly entitled.

Without dwelling on the possibilities of after-the-war business, it is reasonably anticipated that many—in fact very many—of these men will eventually seek positions in that sphere of industrial life in which they were engaged previous to enlisting. It is probably here that patriotism will undergo its greatest test, to show whether our faith in these men has been overshadowed by the lust of a continuation of that prosperity that has only been possible through the trials and sufferings of these very men. These crippled or semi-disabled men will necessarily require some kind of employment to prevent them becoming a burden upon the various communities. Manufacturing establishments of every description should feel themselves obligated to employ several of such men when the occasion arises, and it should be the duty of executive heads to evolve factory methods whereby an armless or legless man would serve a purpose as well as one not thus afflicted. In order to employ these men in a capacity where their reduced ability will not detract from the general efficiency of a plant, it may be necessary for manufacturers to modify or readjust their existing equipments, or otherwise arrange the factory operation in order to provide suitable work at which they may prove as capable as others who are not minus some portion of their physical members.

One of the many details relative to factory operation, and one that is rapidly becoming recognized as an essential factor in economic plant management, is that of material transportation to and from the different machines and departments. Where modern and efficient methods are adopted for this particular purpose, the saving that has been effected has amply covered the initial cost of installation and subsequent maintenance. The mechanical improvements that have been made in the construction and operation of such facilities has almost eliminated the necessity of lifting heavy weights in and out of machines, or carrying same to different positions about the shop. It is this feature of factory operation that should form the foundation for the solution of the problem of the returned soldier. Not only would such labor-saving devices pave the way to a satisfactory settlement of the moral obligation, but it would undoubtedly result in greater plant efficiency. The accompanying illustrations show two automatic factory transportation trucks, the manipulation of which could be ideally handled by a legless or armless man almost as well as another not so handicapped. These trucks are so designed and constructed that there is no necessity for the operator to vacate his position on the operating platform, thus making it possible to so arrange the accommodation to conform to the specific requirements of the man in charge; by means of a suitable seat, men having lost a leg, or even two, would in time be able to manipulate one of these or similar trucks as well as anyone, the operation of the different control levers being the only physical exertion required.

It is in the adaptation of the automatic feature of factory facilities that will ultimately solve the most serious part of the returned soldier problem, especially in connection with the manufacturing industries.

## SCIENTIFIC AND INDUSTRIAL RESEARCH

MANY important matters came before the recent meeting of the Honorary Advisory Council of Scientific and Industrial Research.

A memorandum was forwarded to the Government urging immediate action to make available the varied fuel resources within the boundaries of the Dominion for the use of the people of Canada in the coming year and placing the services of the Research Council at the disposal of the Government to that end.

The council, at the request of the Institute of Civil Engineers of Great Britain, also took steps to bring before the Government and certain manufacturers of Canada the importance of Canada associating itself with the movement which has recently been organized in Great Britain, the United States and France, for combined action in connection with the standardization of various engineering products used and exported from these countries. This is a matter of great importance in connection with the building up of an export trade in this class of products by Canada at the close of the war. Connected with this the council is investigating a number of other questions which have been submitted to it, dealing with post-war conditions with which our Canadian industries will be brought face to face upon the declaration of peace.

It was decided also to approach the Canadian Manufacturers' Association on the question of the development of trade organizations for the promotion of research, etc., in connection with groups of industries, such organizations having been developed with most beneficial results in Great Britain and in the United States. Co-operation along these lines is of the highest importance if Canada is to be able to hold her own in the keen competition which will develop in foreign markets with the cessation of hostilities.

## PROGRESS OF THE STEEL INDUSTRY IN AUSTRALIA

[illegible] the following [illegible] of the steel industry in Australia:

[illegible] principal engineering developments at the annual meeting of the association held recently and stated: That quietly, but surely, a powerful steel industry was growing up in Australia. Not only was it expected that the Lithgow (100 miles from Sydney) and Newcastle (60 miles from Sydney) steel works would henceforth provide the whole of Australia's requirements of steel rails, but the time was not far distant when export might be possible.

### Scientific Aspects

Of yellow and white metal alloys, it was interesting to note the development along sound lines of the manufacture of rolled manganese, phosphor, and other bars, and that difficult business had not been undertaken without due recognition of the necessity for maintaining a laboratory for the scientific control of the processes. Considerable improvement was taking place everywhere in the extension and addition of modern foundry equipment, the capacity of which for large iron castings was now practically unlimited. For the more difficult work [illegible] there was also a most noticeable improvement and an increasing number of plants are being laid down.

The casting of steel rolling stock wheels is gradually developing to a satisfactory stage and it was generally understood that the establishment of another modern plant on extensive lines was contemplated in the near future at Newcastle. When it is remembered that there are now approximately 20,000 miles of railway in operation in Australia, it would be realized what possibilities there were for the local manufacture of rolling stock material.

### Engine Building

A better example of high-class workmanship could not be quoted than the manufacture of modern high speed steam [illegible] are now being successfully made. In the manufacture and export of agricultural machinery, harvesters particularly, quite a striking success has been achieved, and a considerable quantity exported to Argentina and elsewhere. The imperative call of the man on the land for a cheap and handy form of power to supplant hand or horse power has given manufacturers of internal combustion engines a great impetus. Before the war perhaps 10 [illegible] was imported. In ten years time the percentage will probably be reversed. Oil engines, from [illegible] farm unit [illegible] marine engines 150 horsepower are now being made. [illegible] only 15 per cent of the centrifugal pumps used were made locally. This figure is now believed to be 50 per cent. Refrigerating plant has for many years been made but it is worth noting that the largest compressor so far made here was recently completed by a local firm. In machine tools, woodworking machinery, rail and road tractors and cars, tin-making machinery, electric motors, capstans, boilers of every class, including water tube, further reminders are given that engineers are broadening their resources. Steam boilers which before the war could be manufactured and sold for approximately £32 to £10 per ton complete are now costing £70 to £100 per ton, due almost wholly to the fact that boiler plates are only procurable at from £50 to £80 per ton. If a modern steel plate rolling mill had been established locally it could be producing and selling them under present conditions at £14 per ton.

## THE EDUCATION OF THE ALIEN

Walter P. Miller*

THE problem of the foreigner in industry is one that needs to be carefully worked out by the employer to a proper conclusion without undue delay. The census of 1910 tells us that there are in the United States about three million adult non-English speaking aliens. All races are included in this survey, which represents Albanians, Armenians, Austro-Hungarians, Chinese, Danes, Finns, French, Germans, Greeks, Italians, Lithuanians, Magyars, Norwegians, Persians, and other nationalities.

Each immigrant group finds a settlement of its own here in our various settlement centers. The colonies do not fraternize with the English-speaking people, but conform to the customs and habits of their native lands. A knowledge of the English language would help to broaden the mental horizon of these people, would induce them to take an interest in things that are American, and would be a stepping stone toward the attainment of citizenship.

At the present time the foreigner is in demand in the industrial works of our country as he never has been before. The Ford motor works, employing an army of all nationalities, soon found it necessary to take steps to educate these foreigners, giving them an understanding of the English language in order to secure that degree of efficiency that was necessary to their business.

A little thought on the subject will make it unnecessary to reiterate the importance of an alien employee learning to speak English. It is to him an opportunity for better wages, because he can adapt himself intelligently to the work that he is given to do. It secures to him better protection from accidents, because he can read the signs and understand the word of warning that is spoken. His standards of living must necessarily keep progress with his educational advancement, and the holding of property is not a far cry to his ambition. We have, therefore, a better citizen, paying taxes, sending his children to school, a permanent resident of the community, identified with local organizations, and one who thinks of the place he lives in as home.

The solution of the problem of the foreigner can be worked out by no one more successfully than the employer, and the great need for the business man to appreciate how necessary it is for him to lend himself for the encouragement of the education of the foreigner.

If the business men in every community will take an active part in seeing that the foreigner is directed to such schools in his immediate neighborhood that can and will give him the necessary instruction, see that he attends regularly and that his interest is maintained, they will reap the reward of a better emcreased production with its logical sequence of less overhead expense and more profits to the business.

To the community we shall have added a loyal citizen who has detached himself from his racial group, swearing allegiance to but his adopted country, and, if necessary, giving to his adopted country even life itself, that his children may enjoy the blessings of peace and prosperity.

*Chairman of the Committee on Americanization, Philadelphia Chamber of Commerce.

## HEAVY FALLING OFF IN BUILDING PERMITS

BUILDING activity throughout the Dominion fell off sharply during the year just closed, according to figures compiled by *The Financial Post.* Figures from thirty-three cities, twenty-one in the east and twelve in the west, show a slump of nearly $5,000,000.

Toronto led in losses, with a decline of $2,718,921. Vancouver had a loss of $1,644,634. Montreal's loss amounted to nearly a million. There was a loss of nearly half a million in Ottawa, and of $351,746 in Windsor, these being the principal declines. Peterboro, with a gain of $825,463, heads the list of cities showing an advance over 1916. Altogether the cities under review showed a decline of $4,515,627.

The applications for permits in Montreal fell rapidly during the last three months, and although the totals had kept up fairly well during the earlier part of the year, the decline in the later part brought the total below 1916 by almost $1,000,000. As compared with the record year in the history of building operations in Montreal, 1913, the figures for 1917 were less than one-fifth, or $4,38[illegible] compared with $27,037, 297. In[illegible] must go back to the year 19[illegible] as low a level as last year, wh[illegible] was $3,651,164. The figures for the la[illegible] five years were as follows:

| | |
|---|---|
| 1917 | $ 4,387,638 |
| 1916 | 5,334,184 |
| 1915 | 7,486,271 |
| 1914 | 17,394,244 |
| 1913 | 27,037,297 |

Included in the total for 1917 was $1,234,881 for repairs, and $3,252, 757 for new construction.

# CANADA SHOULD BE ABLE TO DEVELOP GOOD TRADE WITH RUSSIA AFTER WAR

Special Interview

## Canadian Trade Commissioner at Petrograd Had Brought Together a Good Organization, but it Has Been Disrupted Owing to Conditions Following the War—Germany Had a Great Hold on Russian Trade.

## The Russian Peasant Has Quite a Mechanical Bent in His System, and Should Develop When Given the Chance to Do So—Conditions in Capital Not Good Now for Life or Business Either.

"HAD it not been for the breaking out of the revolution and the unfavorable conditions that accompanied the war Canadian trade in Russia would have gone ahead in leaps and bounds." That is the opinion of Mr. H. G. Pickard, Russian trade expert of the Massey-Harris Co. Mr. Pickard likes Russia; likes it so well that he wants to go back there as soon as conditions become a little more settled. "Life in Moscow or Petrograd is not the most pleasant thing at the present time," he stated when interviewed recently by CANADIAN MACHINERY. "I refer especially to conditions as they existed when I left Moscow less than two months ago. At that time there was no protection for the people. I have seen armed soldiers of the Bolsheviki stop a man on the street who happened to be wearing a good coat. They would simply take the coat. They enter the restaurants or places where people happen to congregate, hold them up, take what they want and depart. They can just as readily enter a man's home and do the same. thing. There is no use appealing for protection to the police, for the good and simple reason that there are no police to appeal to. Yet, in spite of all that, strange as it may seem, when I left Moscow I felt that I was leaving home and I want to go back. I like the country and I like the people."

Considering the conditions of traffic at present, Mr. Pickard was able to make an exceptionally good trip, it being just five weeks from the time he left Moscow until he arrived in Toronto, which city he left some ten years before in the interests of the Massey-Harris Co., seven of which have been spent in Russia.

### Knows the Country

Mr. Pickard had travelled in Ontario for the Massey-Harris Co. for some time before he went abroad. He is well informed concerning actual conditions in Russia. He knows the trade conditions, the people, their language and their customs. He has followed the trend of the various currents that in the end swelled into the tide that spelled revolution for Russia. He is not a pessimist regarding the future of the country. He has faith in the people themselves, and on this close acquaintance bases his opinion that there is going to be a good future for the development of the Russian trade. He views the present turmoil and uncertainty more in the light of a reaction from conditions of suppression that previously prevailed.

### Canada's Trade in Russia

"Was Canadian trade being developed satisfactorily with Russia before the war started?" inquired the representative.

"It was being handled remarkably well," replied Mr. Pickard. "The Canadian Government had a most capable man at Petrograd in the person of Mr. Just, who was in charge of the trade bureau at Petrograd. I presume he is in Moscow now, as it will probably be safer there than in Petrograd, but mail addressed to him in care of the Embassy will always be safe. I know of many cases where he has been the go-between for the customer in Russia and the manufacturer or producer in Canada. If we had not been up against war conditions the organization that he had worked out would have been the means of sending Canadian trade ahead by leaps and bounds.

### The German Monopoly

"The Russian people in recent years have been getting their eyes open to the fact that they can buy goods cheaper from other nations than they can from Germany, and also that the conditions surrounding the sales are better and fairer. But Germany has had a strangle hold on the trade of that country for a long time. Here's a case that will show it in a concrete way. Just about the time the war broke out I went out in company with Mr. Just, the Canadian Trade Commissioner. We visited a large retail and wholesale store in Petrograd that carried chiefly hardware and other similar lines. To be exact, they had cutlery, house trimmings, including knobs, locks and hinges, millwright tools, machinists' supplies of all kinds, and the other lines that are usually carried in such a place. This was not a small store, but a place that would give employment to at least a thousand hands. The manager was very anxious to show us exactly what he had. It is a matter of absolute fact," continued Mr. Pickard, "that fully 95 per cent. of the entire stock in the store was 'Made in Germany' output. The only things I remembered seeing to break the monotony were some Starrett tools and Yale locks from these United States firms. That is a fair indication of the German influence in Russia, and what the markets of that country have meant to the industrial life of Germany."

### Making a Start

"What success had been met in bringing Canadian goods into the Russian market to compete with the product of Germany?" was a further inquiry.

"A good start was being made, and I am firmly convinced that there were good prospects of success," replied Mr. Pickard. "You see, it is this way, the trade conditions are entirely dependent on the transportation, and even at their best these facilities in Russia are poor. Recently the bulk of trade has entered Russia at Vladivostock. The line leaving there runs as a single track. It is safe to say that it takes three months for a car of goods to go from there to Moscow. In broken lots the time taken for that trip would be much longer, as much as six months at times. It is quite within reason to place the time that it takes a shipment to go from a Canadian point to Moscow at well on for a year. The congestion at Vladivostock just now is almost past description. Everything is piled up there. I have heard men who know the conditions trying to figure out just how much war material is piled up there, but a person can't grasp the confusion into which the shipping trade at this great Russian port has fallen. Much the same thing will apply to Archangel, the only difference being that there is not as much material coming in at that northern point to get piled up. Archangel is open for trade from about the first week in May until the end of October. That is where the ice-breakers are operating that Russia bought from the Canadian Government.

### The Same All Through

"What applies to these two great Russian ports applies to Russian railroads all through. There is not a single inch of space that is not used on every train that now runs. On one trip I made of considerably over one hundred miles six of us had to stand packed in a small toilet department. A person going on a long journey in Russia just now has to put up with all sorts of inconveniences, some of them being of a most disagreeable nature. I found it necessary to leave all my personal belongings behind when I came from Moscow, as there was no chance at all to find space for them on any of the trains. The rolling stock of the railroads is almost done for. The country just now can neither manufacture or repair the engines or cars. I know of one round house where on an average of twenty locomotives used to be handled every month and made fit for

[illegible] Now that [illegible] turn out more than one a month, and the work is of a very different sort. The car windows are nearly all broken, and there is a general rundown, some to [illegible] appearance over the whole system. Roving bands of soldiers seem to think that they have a preference in anything, and they apply this to the trains as they do to everything else. Travelling in Russia just now is not altogether a pleasure jaunt," laughed Mr. Pickard.

### Russians as Mechanics

Although little has been heard of the Russian as a mechanic, Mr. Pickard sees no reason why the people there should not develop in this line were the opportunity for so doing given to them. When asked if the Russian peasant, with proper training, would make an acceptable mechanic, and if this would have any bearing on the future of the country and tend to make Russia an industrial nation, he said:

"Well, our binder is quite a machine for a man to put together who has never seen one," he replied, "and yet I know of cases where Russian peasants, unused to machinery of any sort, have done the trick, and arrived at the result desired. True, they may not have taken the proper or the easiest way, but the peasant has a great knack of sticking with a job like that until he gets it right. That is one thing that would cause me to think that the people there might develop into a great nation were they given the chance and the scope in which to work. Again, go into the Russian universities, and you will find that the students there are trained technically as well as in this country, if not better; but the great trouble is that they have not much of a chance to apply their training. It's a little bit hard for the people of Canada to get a correct idea of what the people of Russia really are. We don't get the best of them in Canada. There are some, in fact, quite a number of Russians who are anxious to get out of the country for various reasons. A man who does so without first securing his passport cannot hope to go back.

### A Wonderful System

"The Russians really have a wonderful system of keeping track of every person who enters their country. This is not exactly along the matter of trade," remarked Mr. Pickard, "but it will show Canadians a condition that is hard for them to realize. There are many political prisoners in Russia. It requires only a very small offence to put a man in the category of a political prisoner there. It is not possible, as it is in this land, to refer to a government official as a 'pinhead.' The one great crime there can be summed up in 'Speaking against the government.' Arrest follows. A trial [illegible] a week, a month, or in a year. The term 'political prisoner,' of which you read so much, does not necessarily indicate that the prisoner is a dangerous man or a bad one. At every station you find the gendarmes, and they listen to conversation, to the remarks of travellers, to everything they can hear. It is a splendid policy in that land to keep your opinion to yourself, especially if they are not favorable to the government. When Kerensky came into power he attempted to do away with a lot of this. He set about to liberate all the political prisoners. It was never intended that the criminal class should get their freedom. But in the confusion that followed the revolution it was simply turned into a wholesale jail delivery. Criminals, etc., at once climbed into the category of political offenders, and when the jails were opened out they came, and the wave of crime that swept over the country following this is now a matter of history."

### German Trade Methods

According to Mr. Pickard, Germany had a wonderful system of following up her industrial expansion with her banking facilities. "As soon as a German industry had found or developed a new avenue for business, immediate assistance would be given from the German banking firms, encouraged and aided by the Government. This worked out especially well in the matter of taking care of collections. It is well known in Russia, probably not here, that a number of the big banking houses there are really German institutions doing business under Russian names. United States has been taking steps to help her business interests there by opening up branch banks. Not long ago the National City Bank opened an office in Petrograd, and later on a branch in Moscow, the idea being to make it easier for American trade to be developed and financed there. German methods of doing business did not bring much favor with many of the Russian people. There was a feeling all the time that the German was getting the Russian country piecemeal and the Russian people resented it. This was the cause for the popularity of the war at the outset. There were other reasons as well, but the chief one seemed to be summed up in the words that Russia was anxious to get a 'crack at the German.'"

### The Natural Resources

"Has Russia the natural resources that would make her a great manufacturing country in case the opportunity presented?" was then asked.

"Undoubtedly she has," replied Mr. Pickard. "Russia has coal, oil, minerals, timber—in short, Russia has everything, but there has been no serious development. The mines are worked largely by foreigners. The Belgians and the French are interested largely in the steel and metal trades. Before the outbreak of the war a movement was beginning to take form in Russia that sought to develop the industrial side of her life. The party were advocating a certain form of protection for the industries that would establish their works in Russia. Their programme included the granting of sites and certain concessions, but, of course, the war cut this short. Tariffs in Russia have gone up tremendously since the start of the war. On some lines the start would be at 10 per cent., and from that working up to as high as 50 per cent. Railroad rates have gone up 100 per cent. since the start of the war. But it will take years and years, even under the most favorable circumstances, for Russia to arrive at the stage where she will be sufficiently of a manufacturing nation to supply her own wants."

### Can't Repudiate Debts

Nor does Mr. Pickard believe that Russia will repudiate her obligations, as announced by the Bolshevik Government. "The Russian business world, sooner or later will have to go into the markets of the world again if they intend to do business. If this mad idea of debt repudiation were successful, no firm, corporation or nation would want to do a cent's worth of business with Russia. For her own protection she will have to discharge her obligations. The amount of the debt looked so big to the Bolshevik Government when it came into power that they could see no way out. They simply said, 'We can never pay this. It's too great.' To the present Russian mind Socialism means freedom, the getting of what they want without paying for it. But to the Russian mind this cannot appeal permanently, for there is an inherent honesty in the great peasant body. In all my experience with them I never lost anything.

### The Haggling Method

"The Russian ruble has dropped and dropped, but that does not affect buying and selling very much. Of course goods are away up now. I paid $40 for a pair of shoes shortly before I left Moscow. In ordinary times you can purchase the standard makes of American shoes there for about $10. The whole trading is done on the old system of beating a bargain. Go into a store and the keeper sizes you up. If you look well to do he will shove on the price. The customer who is experienced will admire the goods, then throw them down and walk out of the store on the pretext that the price is away too high. Nearly every time the dealer will beat you to the door, and a big reduction in the price will result. The same thing applies to the hiring of a cab. Start making a bargain for a ride and you will soon have half a dozen drivers. The result is that you will ride much cheaper than if you had accepted the terms of the first man. Since the war prices of foodstuffs have increased enormously, but wages have also gone up to a considerable extent.

### The Political Parties

Mr. Pickard is doubtful if there will ever be a return to a monarchy in Russia. The great mass of people seem determined on one thing, and that is that the fruits of the revolution shall not be lost to them.

"The terms that describe the different factions in Russia just now are not nearly as confusing as they may seem. The word 'Bolshevik' (although Mr. Pickard says the proper spelling would make it 'Bolshevick') means a man with a large or a great idea. It really is used by way of comparing large with something smaller. The first part of it is 'bolshoe,'

meaning in Russian, large, extreme, or great, and the 'vick' or 'vik' termination simply puts it in the masculine sex. He is simply an extreme Socialist. The Bolshevik have a very large following all over the country. They are especially strong among the working classes. They are found in the army. In fact they have simply carried their ideas from civil and industrial life into the army with them, and that's where a great deal of the trouble has come in from the ranks. Against this faction is lined up what can be termed the 'Menshiviks.' They have ideas that are far less radical and dangerous than the Bolsheviks. When the Constituent Assembly was called in Petrograd it was found that the Mensheviks had 273 members against a showing of 140 Bolsheviks. But the Bolshevik section had the arms with them, and a man with a gun is a great power in Russia just now."

Mr. Pickard has seen Kerensky on several occasions. He did not impress him as a man who was big enough for the job he undertook to handle. He is not likely to come to the top again, although it is possible he may be heard from in a minor capacity in some future government.

### A Good Place to Leave

"Everything was done by the card system in the cities of Russian long before I left there," said Mr. Pickard in conclusion. "Street fighting was not at all uncommon. In fact it got to be more of a matter of routine than exception. Armored motor cars were seen in action in the streets. The troops simply went mad. Very few people ventured out after eight in the evening. The daily allowance of bread was 3½ ounces. It was made of rye, wheat, oats and barley, with the husks and all ground in with it. It looked for all the world like a straw ball. The allowance of butter is ¼ of a pound every third week. Meat is served in small quantities only twice a week. The cattle have been so poorly fed that the meat is of very poor quality. You can get nothing without a card. But in spite of all that I want to go back to Russia. I would like to make my home in Moscow. It may seem strange," said Mr. Pickard, "but it's a fact that I am homesick for Russia. I like the land and I like the people."

## PULP AND PAPER SITUATION IN AUSTRALIA

B. MILLIN, Canadian commercial agent for New South Wales, reports as follows in regard to the pulp and paper situation in Australia.

### Shortage of Paper

The annual conference of the New South Wales County Press Association was recently held in Sydney and the question of future paper supplies was earnestly discussed. During the conference it was stated that the normal consumption of paper for newspapers in Australia was about 100,000 tons per annum. During the first year of the war the quantity imported was 70,000 tons; in the second it was 60,000 tons; last year it was 50,000 tons, and now newspaper proprietors are faced with a notification from the Commonwealth Government that it could not undertake to bring into Australia more than 25,000 tons after January 1. In the open market in Sydney, with an importation of 50,000 tons per annum, the price would be about £50 per ton. With a cutting down to 25,000 tons the trouble was going to be more acute. The association buys paper collectively, and had it not been that it was able last year to obtain some extra supplies at least 100 papers in this state would be out of print. A deputation from the association waited on the Premier of this state and he spoke of the encouraging prospects of manufacturing paper. In the adjoining state of North Queensland paper pulp was being produced from blady grass which it is estimated can be manufactured for £7 per ton. It is also stated that pulp costs 75 per cent. of the cost of paper, consequently paper could be produced at about £10 per ton. Add the freight from Queensland to Sydney £3 per ton and the total cost of the paper will be £13 per ton.

### Manufacture of Paper Pulp

Paper pulp is manufactured only at one place in the Commonwealth and that is at Cairns, Queensland. The works have been established within the last few years and are mainly experimental. The production so far has not been very large and the raw material used is blady grass and the plant known as *sida retusa*. Experiments have also been carried out with several other materials.

The Commonwealth Advisory Council of Science and Industry has collected much information on the subject, and states that the present supply of raw materials is very inadequate for the development of the industry to a point which would render Australia self-supporting in the matter of paper, and that it appears clear that the only possibility of reaching this point is by growing some crop for the special purpose of manufacturing paper pulp from it. Of possible crops esparto grass and soft woods appear to be the only ones worthy of consideration, and it is doubtful whether under Australian conditions esparto grass could be harvested sufficiently cheaply to make its cultivation a paying proposition.

A scheme has been suggested for growing timber for pulping in the cold and mountainous districts where there is a plentiful supply of water available for mill purposes. Spruce and poplar are the timbers mentioned and it is estimated that the material would not be available for fifteen years.

### Government Assistance to Manufacturers

A minister of the Commonwealth Government recently stated that all efforts to make paper from Australian wood pulp had failed, and that as no claim had been made for a bounty on production it would be useless at present to earmark money for that purpose. The money which would have been allocated for the payment of the bounty was being utilized in carrying out experiments in paper-making at the Government Science Bureau. It is hoped that the experiments will eventually lead to the development of the paper-making industry. The difficulty with Australian woods is that they are too resinous. Chemists are now endeavoring to extract those restrictive qualities from the wood and as soon as they become successful the government would give practical encouragement to the industry.

On the other hand the acting premier of the State of New South Wales was more hopeful and stated that experiments are being conducted in the manufacture of paper and that they have been eminently satisfactory up to the present. Although the State is a large user of paper there is no intention at present of establishing a paper mill.

## TRADE OPENINGS WITH ITALY

W. McL. CLARKE, Canadian Trade Commissioner at Milan, Italy, reports that inquiries being continually received indicating that many important firms in Italy are turning their attention to Canada as a new or larger source of supply for the varied needs of this market, both now and after the war. The products thus far inquired for are enumerated herewith. The names and addresses of the inquirers may be obtained on application to the Commercial Intelligence Branch of the Department of Trade and Commerce. (Refer Trade Inquiries Branch.)

### Chemicals

Bichromate of potash and soda, caustic soda, soda ash, silicate of soda, sal-ammoniac, sulphate of soda, acetic acid, sulphate of copper, nickel salts, cobalt salts.

### Machinery

Agricultural, wood working, metal working, shipbuilding.

### Metals and Minerals

Corundum, mica, asbestos, pig-iron, nickel, cobalt.

### Miscellaneous

Auxiliary machinery used in ship building and engineering trades, steel plates and sections for shipbuilding high-speed steel, shafts for steamers, railway and tramway points and crossings, mineral oils, pumps, railway supplies, motors, wood-pulp, agricultural instruments, transformers, dynamos, turbines, electrical motors, electrical cable, marine oil engines, wrenches, pliers, mandrels, helices, chisels of high-speed steel, electrodes, castings and rolled steel, drums and discs for steam turbines, machine tools, files, screws, saws for wood and metal, carpenters' planes, hardware, drills.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## HANDLING THE LARGER SIZED SHELLS.

By M. H. Potter.

One of the most requisites in efficient quantity production is an adequate handling system. A well-balanced production system is of little avail if the shop transportation factor is lost sight of.

It has been the writer's experience in the manufacture of the larger (6 in. or over) shells, that one of the most important minor details is the combating and overcoming of the congestion of shells in the shop. As production increases this factor becomes of more importance and should therefore be taken into consideration at the outset and the necessary transportation facilities be provided at the time when the machine tools are set up.

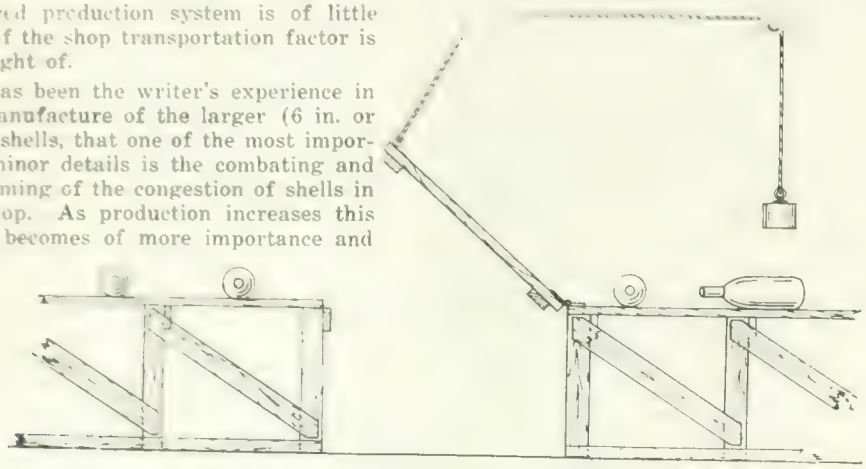

FIG. 1. BENCH SYSTEM

The bench system as shown in Fig. 1 is the only satisfactory way, although the trucking system is very suitable for the smaller shells. These benches should be wide enough to allow two shells to be rolled past each other and also permit a double row of shells to stand in the centre. They can be made up in sections and bolted together in place. Whenever it is necessary to cross the main aisle of the shop, a bridge as shown should be built. Steps can be built to permit of crossing the benches elsewhere if necessary.

The simple device shown in Fig. 2, facilitates the rolling of shells along the bench. It consists of a hard piece of wood with a piece of pipe driven over the small end.

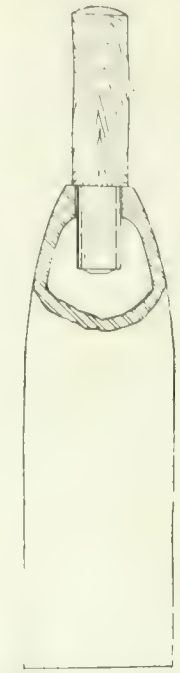

FIG. 2. SHELL HANDLE

Shell manufacture frequently involves the employment of female labor, and necessitates therefore, an increased number of operations, in order to make each operation as simple as possible. As a result an efficient and well managed transportation department is essential. The managing of this work is no small job and should be intrusted to some one who is familiar with the employment and handling of the lower class of help.

The duties of the operators running the various machines consist of what the name implies. Likewise the inspectors or the tool setters. They must be operators, inspectors or tool setters and nothing else. That is if they are to be efficient and produce the maximum amount of work.

A clerk must be employed to keep account of the heat numbers of the shells in order to properly arrange the series for preliminary inspection. He should have a definite alloted number of laborers working under him. The special truck shown in Fig. 3 is adapted for

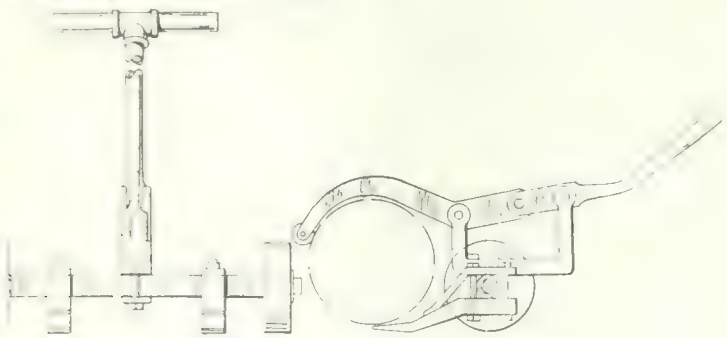

FIG. 3. SHELL TRUCK

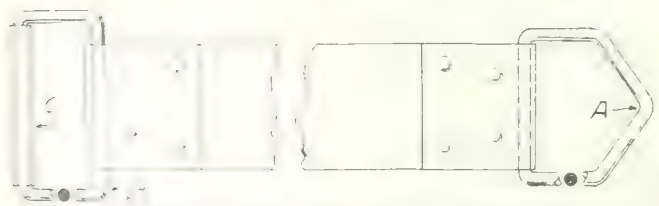

FIG. 4. SLING. THE HOOK A IS PASSED THROUGH THE NARROWER HOOK B.

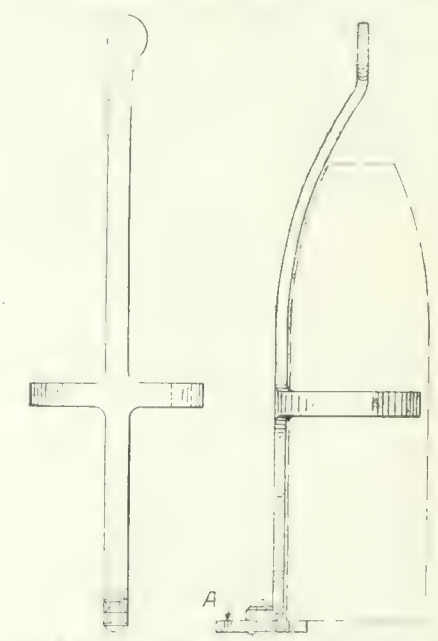

FIG. 5. SHELL SLING. THE HOOK A IS TURNED SIDEWAYS IN PLACING SLING OVER SHELL.

handling the forgings or shells along the floor. Its main use is after nosing in, when the shells are placed on the forge room floor to cool.

The other devices shown lend themselves to quick and easy manipulation, and can be depended upon. Fig. 4 when properly fitted to the inside contour of the shell can be used after a number of different operations. It may be used after the nose has been threaded without injury to the threads.

Hydraulic lifts were used to take the shells from the bench to their place in and from the machine. Whenever possible (single purpose open end machines were used) the shells were rolled along the bench and directly into the chuck.

If the system as here outlined is properly installed and worked out as an independent department similarly to the inspection or any other department, the results obtained would give a greater output, and a shop free from confusion and congestion. True, there will be times when certain operations may be held up or drag behind the others but this will be readily overcome by the transportation department.

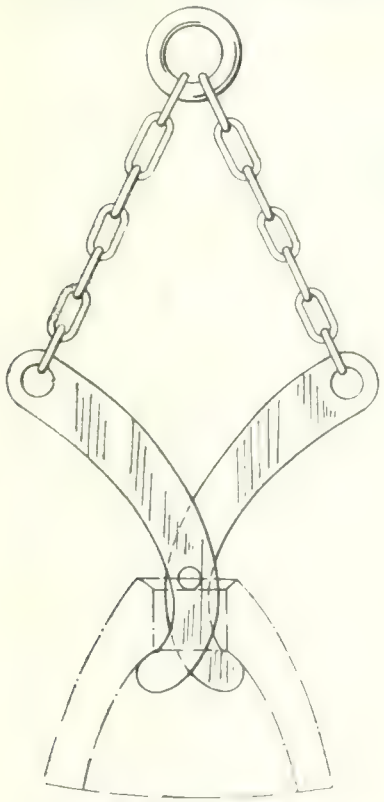

FIG. 4. SHELL TONGS

The problem of removing the chips and cuttings was handled by this department also.

## ROUGH TURNING SHELL DRIVER

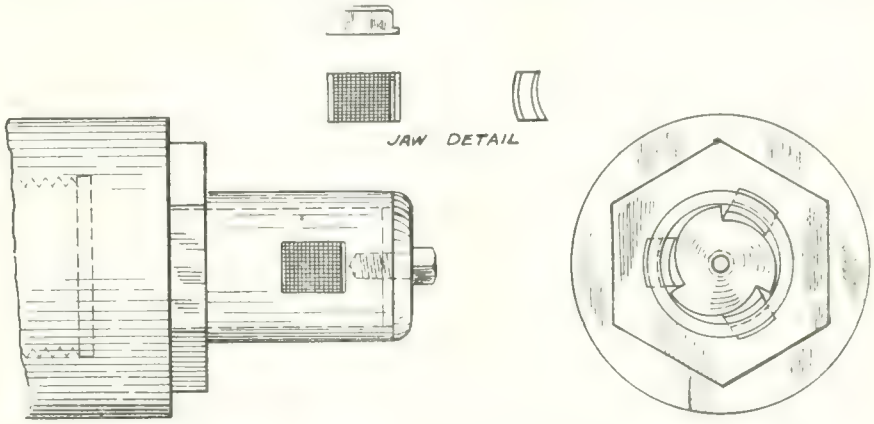
By H. A. W.

CONSIDERABLE difficulty has been experienced by shell makers, particularly those machining high explosive shells, in getting a cheap, efficient, and long-lived driver for the rough turning operation. The accompanying cut shows a sinple device which has been used on 4.5 in. British howitzer shells with marked success for over two years. In the rough-turning operation it is necessary for the driver to perform the dual function of driving and at the same time revolving the shell true with the rough bore of the forging, so that after the operation is completed the walls of the shell are of a uniform thickness on all sides.

Expanding mandrels, which support the shell independently of the tail center have been tried, but owing to the excessive overhang have shown a tendency to spring and thereby produce inaccurate work.

The short driver shown gives all the driving power necessary and centres the open end of the shell. The base end of the shell is centred so that with the aid of a tail center the shell is revolved true with the center hole of the forging. The end view shows how a three point cam is milled, and the deeper the cut taken by the tool the harder the little internal expanding jaws grip the shell.

The cam, the jaws, and the jaw-holder are all made of carbon tool steel and hardened. The jaws are serrated in such a way as to have a tendency to dig into the forging as the cut gets heavier. The jaws are kept from falling out of the fixture by small flanges on each end. No springs are used to withdraw the jaws from the work or to keep the jaws well into the fixture to enable a shell to be placed on the driver. The front ends of the jaws are bevelled so as to allow the shell to be easily placed in position. Originally a piece of spring wire passing through grooves in the jaws was used, but this was discontinued, and the flanged jaw adopted.



DETAIL OF AUTOMATIC SHELL ARBOR.

The end of the fixture is protected by a cast iron washer held in place by a cap screw. Once a day this is removed and the small chips and dirt removed. A small quantity of heavy oil or cup grease is placed inside to lubricate the moving parts.

The back of the jaw-holder is flanged and the flange milled, giving six flat sides, which ensures the easy release of a shell should it for any unforeseen reason get seized. It is rarely that a shell seizes after the fixture has machined five hundred shells. Once in a while a shell in the first five hundred is released through the medium of a wrench on the jaw-holder. After the fixture has been worked in, all shells can be removed by hand. This fixture enables an operator to speed up production and run more than one machine.

## GRIPPING AND DRIVING METHODS FOR LATHE WORK—II

By E. Scriber

Arbors in the machine shop are one of the indispensables and many varieties of the same are in evidence although nothing has been found which supplants to any great extent the ordinary strait arbor that is slightly tapered for driving purposes and while there is some objection to driving an arbor in and out of a hole with a hammer the arbor press has done much to remove this objection. The strait arbor needs no extended description here, the expanding arbor was described in Fig. 6, and a group of arbors made for various purposes are shown in Fig 7.

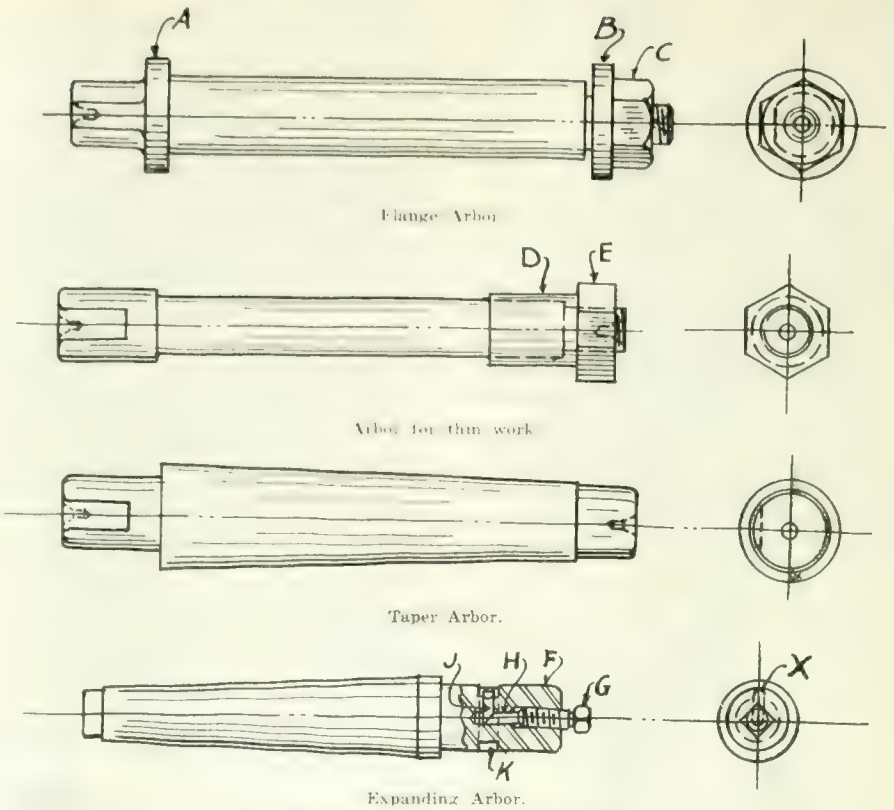
The first of these is known as a flange arbor and is often used for turning or milling a number of thin pieces; this is made a slip fit in the hole of the work and the pieces be they one or more are gripped between the flange A and the washer B, while the nut C is of course used for tightening purposes. If it sometimes happens that work is to be machined where some portion of the work is but slightly larger than the diameter in the hole of the work in it, such as flattening squares and turning thin bushings. An arbor suitable for handling such work without interference is shown below the flange arbor and is used in the same manner except that a sleeve D which is turned down so the tool or cutter will not strike it in machining is provided. On this arbor is shown a thin nut E for tightening purposes. The advantage in using a thin nut is that fewer turns are necessary to bring [illegible] of the thread, saving somewhat in time where a number of parts are handled.

The third illustration in Fig 7 shows a tapered arbor; [illegible] type depending on the taper for driving purposes. In the lower view of Fig 7. an arbor that fits into the headstock of the machine is shown, the work is slipped over the portion F until it comes against the shoulder, when by tightening the screw G which pushes in a pin H this in turn forces the pin J up; the top of this pin J is beveled off at X and this bevel causes the ring K to expand and

...ing the work in the hole. In making this arbor the ring is hardened and ...ing tempered which causes it to close in when the screw is released. In assembling the ring on the arbor it is ...ing into position in the ...

Two other arbors which grip the work in the hole are shown in Fig. 8. The first is a ... roll grip arbor, holds the work by forcing a roll. A wedge ... between the ... and a hardened plate B. The ... is pushed up against the shoulder ... and the ring D, held in place by screws, keeps the tool in position. This arbor is placed between centers on the lathe and is driven by a dog in the usual manner.

A plain expanding arbor was shown in Fig. 6 and an expanding arbor of a more complicated type is illustrated in the lower view of Fig. 8. This arbor is placed between centers in the usual manner although the construction is one which permits of its use in a lathe spindle or chuck. Likewise the roll grip arbor may be so used. In using this arbor a steel ring E ... is made to fit on the arbor. This ring comes against the shoulder at X, the work is slipped over the bushing F until it is snug up against the ring, the bushing is then forced up the taper by ... of the nut G; this expands the bushing which is split and securely grips the work.



Flange Arbor.

Arbor for thin work.

Taper Arbor.

Expanding Arbor.

FIG. 7. VARIOUS TYPES OF ARBORS

After completing the operations on the work the nut G is released; when by driving a wedge H in this forces the ring E back which in turn pushes the work off the arbor. When the work is removed the wedge is of course slipped back and the ring returned to its original position. With this driving arbor the work is always located in the same position; this is an advantage when turning to a shoulder, facing to length, grooving etc. The pin J prevents the wedge from dropping out of the arbor, the elongated slot in the wedge permitting the same to be driven in or out sufficient to force the work off the arbor.

Perhaps the most varied of lathe driving methods apart from special fixtures are the various methods of holding and driving work by means of chuck jaws. No attempt could be made here to include all of the various methods which exist for this purpose and in fact, this would not be desirable, but a number of examples showing the general run of chuck jaws are illustrated. Referring to Fig 9, the upper left hand view shows a standard chuck jaw gripping a piece of work by the outside diameter, the illustration to the right of this shows the same jaw reversed, gripping a large casting inside or under the rim; the lower view in this illustration likewise shows the same set of jaws gripping on the periphery of a casting, using the step of the jaws designated as A in all the views.

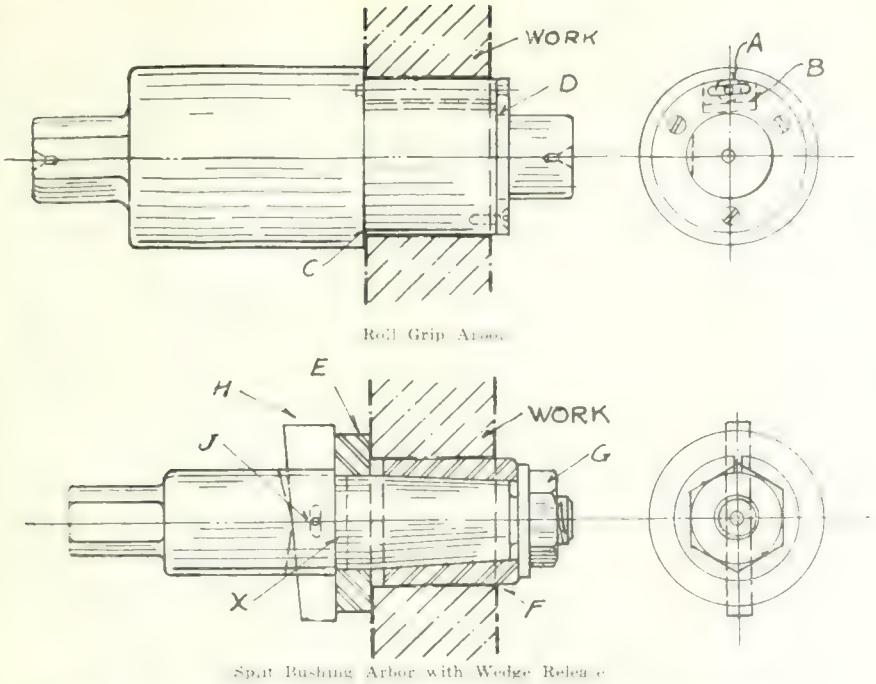
FIG. 10 ... AWS AND CHUCKING ARRANGEMENTS FOR VARIOUS KINDS OF WORK



Roll Grip Arbor.

Split Bushing Arbor with Wedge Release

FIG. 9. TWO HANDY LATHE ARBORS HAVING DISTINCTIVE FEATURES

These illustrations show quite clearly the adaptability of this type of jaw.

The same set of standard jaws used for gripping thin work are also shown in the upper left hand view of Fig. 10. Here also the step A is used for gripping but as it is necessary, in machining this piece, to face the side of the work B which under ordinary conditions would come below the face of the jaws at C, three spacing blocks D are provided. These blocks have a hole drilled through them and a wire is put through these holes, by means of which the blocks are hooked over the jaws in the manner shown. In putting the work into the jaws it is held back against these blocks, thereby being trued up and held out the correct distance to permit of squaring up. Above the chuck a detail of the spacing block is shown.

The upper right hand view of Fig. 10 shows a set of chuck jaws which might be termed extension jaws; these jaws are used in the same manner as those just described, being simply made long to get a good grip on the work. In the lower view of Fig 10 a set of built up jaws are shown. The manner of using these jaws is obvious as they are used for gripping work which has been finished on the outside while the hole is being machined. These jaws are made in two pieces, the surface next to the chuck E being bored out a few thousandths large so it will just centralize the work at that end while the end F grips the work tight and does the driving.

When using chuck jaws for manufacturing purposes it is often advantageous to make a special set of jaws and keep these jaws for one particular job, by so doing, the jaws may be bored out to conform to the diameters which they are to grip, thereby making them grip the work the full width of the jaws and not at one or two points as is the case where the radius of the jaws does not conform to the radius of the work. By this it is meant that if the work is smaller than the bore of the jaws it will be gripped in the center of the jaws only, while if the work is larger than the bore of the jaws it will be gripped on the edges of the jaws.

A set of jaws made with this in view are illustrated in Fig. 11; these jaws are made double ended and one end is hardened while the other end is left soft, the hardened is scored and grips the rough diameter A, while the two diameters B are machined. After machining these diameters the jaws are reversed on the chuck and the soft end of the jaws is used for gripping on the finished diameter D, while the diameter E is turned. Other operations on this piece might consist of boring, facing, reaming, etc., although these are not included in the description.

Another type of special jaw is shown in Fig. 12. This jaw A is beveled at B. The purpose of this is to cause the work to be wedged back against the surface C while gripping; this makes a more secure grip where the work overhangs the jaws considerably as in this instance. The operations performed on this piece consist of boring the hole, turning the outside up to the shoulder and cutting the piece off into rings and the flange X is simply cast on the piect for gripping purposes. An example of chuck jaws gripping on a pulley hub and another example of chuck jaws gripping under the rim of a gear are shown in Fig 13. The jaws which grip the pulley on the hub are extended out so that a facing tool may square up the flange of the pulley at A and the manner of holding the work is obvious in this instance. Referring to the jaws which grip the gear these are made to grip under the rim and the surface B is used to back up the work. The advantage in gripping under the rim on this gear is that the outside is thus turned fairly true with the under side of the rim and as the hole in the gear is bored and the hubs turned the gear is much more apt to run in balance than would be the case if it were gripped on the hub when machining. Gripping on a small hub and turning large diameters magnifies errors in the hub or, in other words, if the hub is out of true with the outside in the casting the outside will be turned true with the hub but the sur-

Gripping Hub of Pulley. FIG. 13. Gripping Under Rim of Gear.

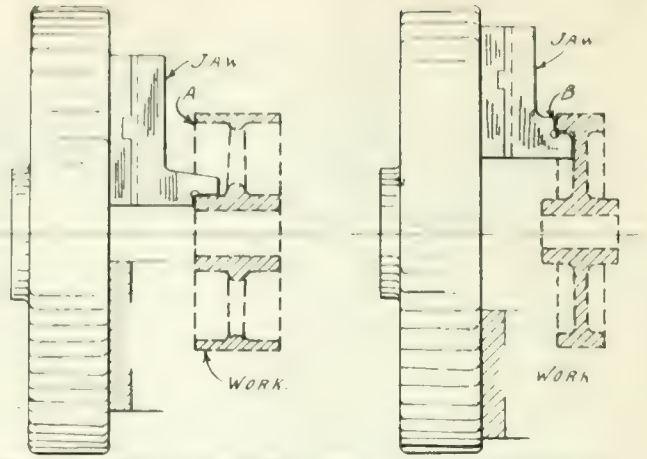

FIG. 14. METHOD OF GRIPPING WORK TOO LARGE FOR CHUCK.

face under the rim will be out of true with the hub and the outside, this leaves the rim thin on one side and makes a bad job.

Fig. 14 illustrates a set of chuck jaws designed for gripping work slightly larger than the normal capacity of the chuck. In this instance it will be noted that the jaws extend beyond the chuck at A and the jaws will therefore, grip the outside diameter of work somewhat larger than the chuck.

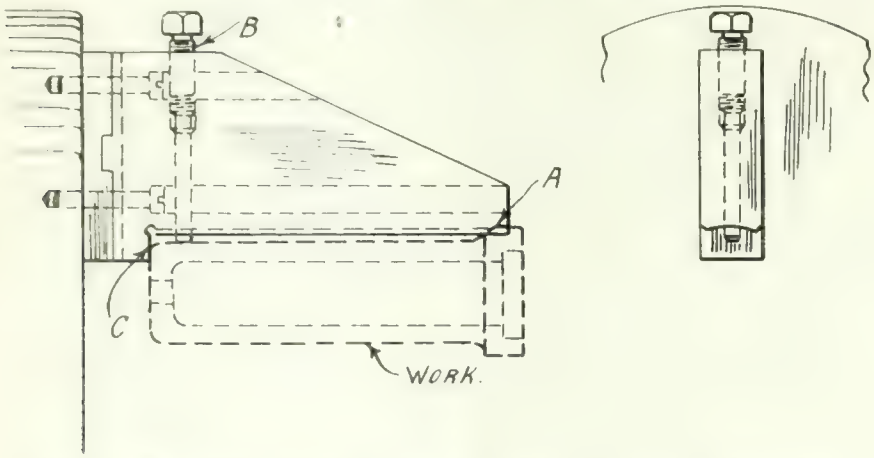

FIG. 15. METHOD OF GRIPPING LONG WORK IN TWO PLACES BY LONG JAWS.

A set of chuck jaws for gripping extra long work having two diameters are shown by Fig 15. These jaws are constructed so as to grip the work at A while the screws B are used for supporting the work at the end near the chuck. The work is located in position by means of the back edge of the jaw C. A set of three cast iron chuck jaws built up to handle the work shown in position Fig 16., have six spring pins in them to aid in holding the same when gripping, and the construction of these jaws is as follows; the main portion of the jaws A are cast iron and these jaws have hardened steel plates B set on them. These hardened steel plates are bored out and grip on the surface C. This surface is not long enough to effectively grip the work although they are used for driving the same, therefore after gripping the work between these plates just tight enough to hold it is trued up in the chuck and the six spring pins D are set up in contact with the work and locked there by means of the screws E, and beveled shoes F in the usual manner. With the work running true and all spring pins in contact the jaws are now set up tight and thus securely holding the work true and driving the same while boring and facing. A detail of the spring pin is shown in the lower left hand corner of this illustration.

Various modification of this design are used to good advantage, and the use of spring pins and screws in chuck jaw design can often be made to do work which would otherwise require an expensive special fixture.

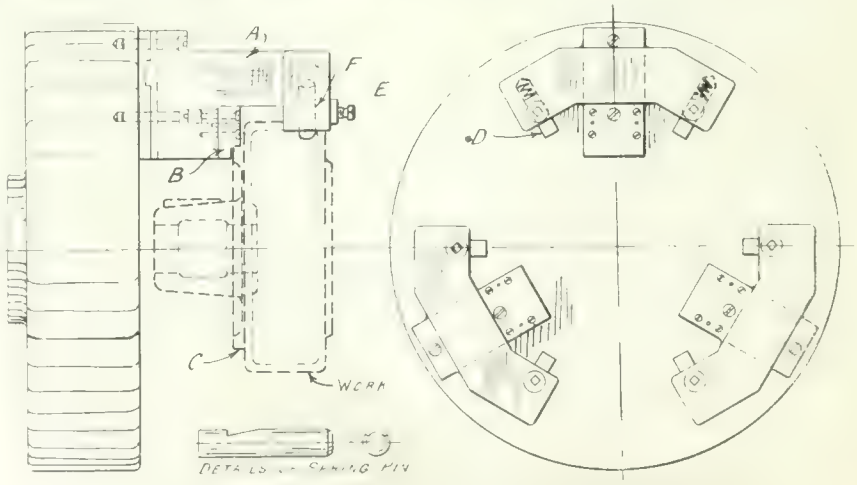

FIG. 16. EXAMPLE OF BUILT-UP JAWS AND SPRING PIN.

## THE WOOD WORKING ENGINEER

By D. A. Hampson

GASPER Chase was a self styled "wood working engineer" and really there seems to be no good reason for objecting to such a term. Chase had a shop that made wood specialties from wooden nutmegs to picture frames. He himself knew the business from A to Z and had the respect of all in his own line who knew him. They phoned to us one day to know if we had any babbitt, good for spindle bearings. Said they had been buying of the F—— Co., who did their repair work, but the babbitt didn't give satisfaction.

Well, we supplied them with Mongolia and genuine babbitt and No. 4 metal during the succeeding year but they complained a good deal about all three. To our queries they replied that they most certainly did not overheat the babbitt, they used a good grade of mineral oil, they did not set the boxes up too tight but still they had trouble with the bearings and journals roughing up. They lost much time re-pouring and with hot bearings.

Frank, our outside man, was going

past their shop one day and we asked him to stop and see if he could find any reason why they were having so much trouble. It happened that he was just in time. The men who did their babbitting had finished pouring the boxes of a planer and had scraped them to a fair fit. When Frank entered the room, he was putting the final touches on with a piece of emery cloth wound around a file—yes, scouring the babbitt with emery. Frank asked if he didn't know that the particles of emery would stick in the babbitt and cut the shaft and would work lose and roll around tearing up the surface of the box. No, they hadn't heard of that and thought emery cloth was the proper thing to use on all metal.

Before Frank left he had thoroughly instructed the force in the babbitt scraping process which requires no finishing. Mr. Chase was called in to O. K. the change. He had seen the man emerying the boxes but did not know that it was wrong, "I'm a wood working engineer you know and so far as I knew that was the right way to do—but a man can't know everything." They got results from any grade of new babbitt after that.

## GRAPHITE IN OIL

IN preparing mixtures of graphite and oil for lubricating purposes, it was for a time thought essential that the graphite should be ground to the utmost practical degree of fineness in order that it might remain suspended in the oil without any tendency to settle by gravity or choke the passages of the lubricators, and in pursuit of this aim, methods of preparing graphite were evolved capable of giving a powder in which no particle exceeded 1-250,000 in. in diameter.

When, however, such fine particles are mixed with oil, a curious phenomenon is observed. The particles begin spontaneously to coalesce, and when the mixture is examined under a powerful microscope, it is seen that the particles are in perpetual zig-zag movement through the oil. The explanation, as given by the Brownian hypothesis, is that the movement is due to the particles of graphite being struck by free electrons, whereby a particle, in being struck, starts with a jerky movement, and continues moving until arrested by the fluid friction of the oil, provided it has not already been struck by another electron, causing it to bound off in another direction.

During these erratic movements the particles of graphite collide with each other, and, as a result, adhere; they in turn are struck by other particles, and in this manner there is gradually built up a mass of adhering particles which is subject to the action of gravity, and results in settling out. Various expedients have been resorted to in order to negative this tendency. The one most commonly made use of is that of coating the finely-ground particles with a foreign substance and then effecting a high dispersion of those coated particles throughout the oil.

The coating material is usually a vegetable compound, such as castor oil, or it may be tannic acid or an allied tanning compound. By these means the permanent suspension of the ultra fine graphite particles in oil has been successfully achieved, but of late the question has been raised whether this extreme fineness, to the securing of which so much effort has been directed, does not of itself render the graphite ineffective.

It is to be borne in mind that in the bearing properly constructed, lubricated, and in operation, the bearing surfaces are completely separated by the oil film, and the particles of graphite simply float in the film, exerting no appreciable effect, either beneficial or otherwise. In such a bearing the graphite is not intended to play any part, its role begins when, for any reason the oil film between the bearing surfaces is destroyed. Then, as the oil film is squeezed out, the graphite particles are carried along with the oil from between the bearing surfaces until the film is reduced to a thickness corresponding to the dimensions of the largest particles of graphite, which at this stage will be arrested and held between the surfaces. Upon the complete destruction of the film these particles so held are crushed and embedded into the grain and pores of the surfaces, and thus are made to perform their function of solid lubrication.

Mr. C. H. Bierbaum, who is chairman of the Bearing Metals Committee of the American Society of Mechanical Engineers, asserts positively that fineness is inimical to utility on the ground that the smaller the particles are the less will be the amount of graphite so intercepted between the bearing surfaces; therefore, a given amount of graphite is efficient if it exists in particles of the largest possible size, and, contrariwise, the more nearly permanent a graphite suspension is, the more completely is it carried out from between the bearing surfaces when the oil film is being destroyed. This, he says, can be demonstrated in a most striking manner by taking a light-colored lubricating oil, thoroughly mixing with it a definite amount of graphite, and then placing it between two accurate glass surfaces, and observing the amount of color left after a definite pressure has been applied for a definite time, while maintaining a fixed temperature. An amorphous natural graphite, ground so that its coarsest particles do not exceed 0.002 in. shows under the foregoing conditions an almost opaque surface, while a commercial graphite suspended in tannin, and whose largest particles do not exceed 1-250,000 in., shows a substantially colorless surface. The reasoning is sound and the illustration suggestive, but in view of the often experienced efficiency of ultra-fine graphite in oil when applied to troublesome bearings, there would appear to be factors in the action of such graphite under working conditions of which the theory does not take account.

## SANDING SLIPPERY IRON FLOOR-PLATES

WHEN iron floor plates become worn smooth, they are dangerous under foot, especially when wet. A method of roughening them slightly is as follows:—

Mix a small quantity of powered sal ammoniac thoroughly with fine sand. Sprinkle the mixture over the iron floor, covering it with a thin layer. Damp the surface with a sprinkling can, and permit the material to remain overnight, or preferably over a holiday. Sweep up the sand and it will be found that a rough coating has been formed which will last several weeks. The process may be repeated until the desired roughness is obtained.

## GAUGING CUTTING TOOLS

By J. H. R.

WHERE several diameters are required on the one piece of work it is often the practice to use a turret tool post in place of the solid style generally used on standard engine lathes. For repetition work, like the production of shells and shell parts, greater efficiency is often attained by using several tools mounted in a revolving support or turret so that each separate tool, when turned to the working position, will be ready to start cutting without further adjusting to height or direction. Where this method is adopted it is necessary to have suitable stops located on the cross slide, or a mental record of the graduated position of the cross feed screw, to avoid unnecessary gauging of the work when starting the cut. The nature of the work, and the fact that the various cutting tools will require grinding at different periods, means that with each resetting of a tool a corresponding adjustment must be made in the stops or graduations. The method adopted in one shell shop, and one that has given very good satisfaction, was the use of a small slate, mounted on a block and conveniently located to be always facing the operator when setting the tool to the cut. No stops were used, but each tool position had a specific letter or number, and against this letter or number was placed the graduation at which the dial should be set for that particular tool. Should one of the tools require sharpening it was removed and ground, and when again adjusted to the correct diameter of cut the new graduation was recorded on the slate leaving the register of the other tools the same as before. Each tool as it was ground and reset entailed the erasion of the old mark and the recording of a new graduation.

STATISTICS shows that there are few safer places than a railroad train. In 1916 railroads whose lines totalled 139,000 miles transported 60 per cent. of the country's entire passenger business and 67 per cent. of its entire freight business without losing a passenger in a train accident. The mileage controlled by these roads equals that of Germany, France, Austria-Hungary and Russ[illegible]

## LAUNCHING A FREIGHTER IN MID-WINTER

AN unusual event took place at the Polson Iron Works, Toronto, on Feb. 11, when the 3,500-ton steel freighter Asp was launched in spite of the severe weather and thick ice in the bay. As a result of the exceptionally severe winter the ice in Toronto Bay was unusually thick and a large sheet had to be removed before the launching could take place. The method adopted for removing the ice was decidedly ingenious and perfectly successful.

### Ice Feature

A large sheet of ice, 300 feet by 8[illegible] feet, and approximately 28 inches thick, was first cut away and broken up, beginning at a point about 150 feet from the end of the dock. Two narrow channels 45 feet [illegible], [illegible] 300 feet in front of the ways, were then cut in the ice, forming a sheet 450 feet long by 70 feet wide. This sheet was towed into the large space prepared for it, leaving open water in front of the ways. The ice in front of the ways on the far side was then blown up with dynamite, the loose blocks forming a cushion for the ship when launched. The ice in the dock in front of the ways ranged from 48 inches to 54 inches thick. Altogether approximately 6,000 tons of ice had to be removed before the launching could take place.

### Constructional Features

The Asp is a sister ship to the Tento launched last October, and was the twelfth ship launched at the Polson's yards since last August. The Asp was built for Norwegian interests, but will be taken over by the British Government for the duration of the war. She was christened by Mrs. Winstrup, wife of Captain Winstrup, representing the owners. The Asp, like the Tento, is of standard construction for ocean service, built to the highest class Bureau Veritas. The principal dimensions are as follows: Length over all, 261 feet; length between perpendiculars, 251 feet; beam moulded, 43 feet 6 inches; depth moulded, 23 feet. The mean draft will be 19 feet 6 inches when carrying a total deadweight of 3,500 tons.

THE "ASP" AFTER LAUNCHING THE LOOSE ICE OBTAINED BY DYNAMITING RECEIVED THE IMPACT OF THE HULL IN EXCELLENT MANNER.

The engine room, boiler room and navigating bridge deck are amidships, with cargo spaces fore and aft. The ship is of single deck type, and was built on the deep frame principle. The deep frame system with auxiliary side frames constitute the basic constructional features of the hull fabrication. She has a cellular double bottom fore and aft, also peak tanks and power watertight bulkheads. The shell plating is overlapped at the edges with overlapped scarf butts. The Asp is a single screw freighter.

### Main Propelling Engines

The propelling machinery has been constructed to Bureau Veritas requirements for a working pressure of 180 pounds per sq. inch. The main engines are of inverted, direct-acting, surface condensing, triple expansion type, the cylinders being 20½ in., 33 in., and 54 in. diameter by 36 in. stroke. The condenser and pumps are independent of the main engine structure. The H.P and I.P. cylinders are served by piston valves, and the L.P. cylinder by a double ported slide valve. All these valves are on the fore and aft centre line of the engine. The bed plate is of box section cast iron, as are also the columns. All shafting is of best open-hearth forged steel. The crank shaft is of built-up type, with cast steel crank arms. The connecting rods, cross-heads, and piston rods are of open-hearth, forged steel. The valve gear is of Stephenson link motion type, with direct acting steam reversing gear. The propellers are four bladed of cast iron.

[illegible] IN THE LAKE TO RECEIVE A 450 FT. BY 70 FT. SHEET OF ICE FROM THE LAUNCHING BASIN.

### Boilers

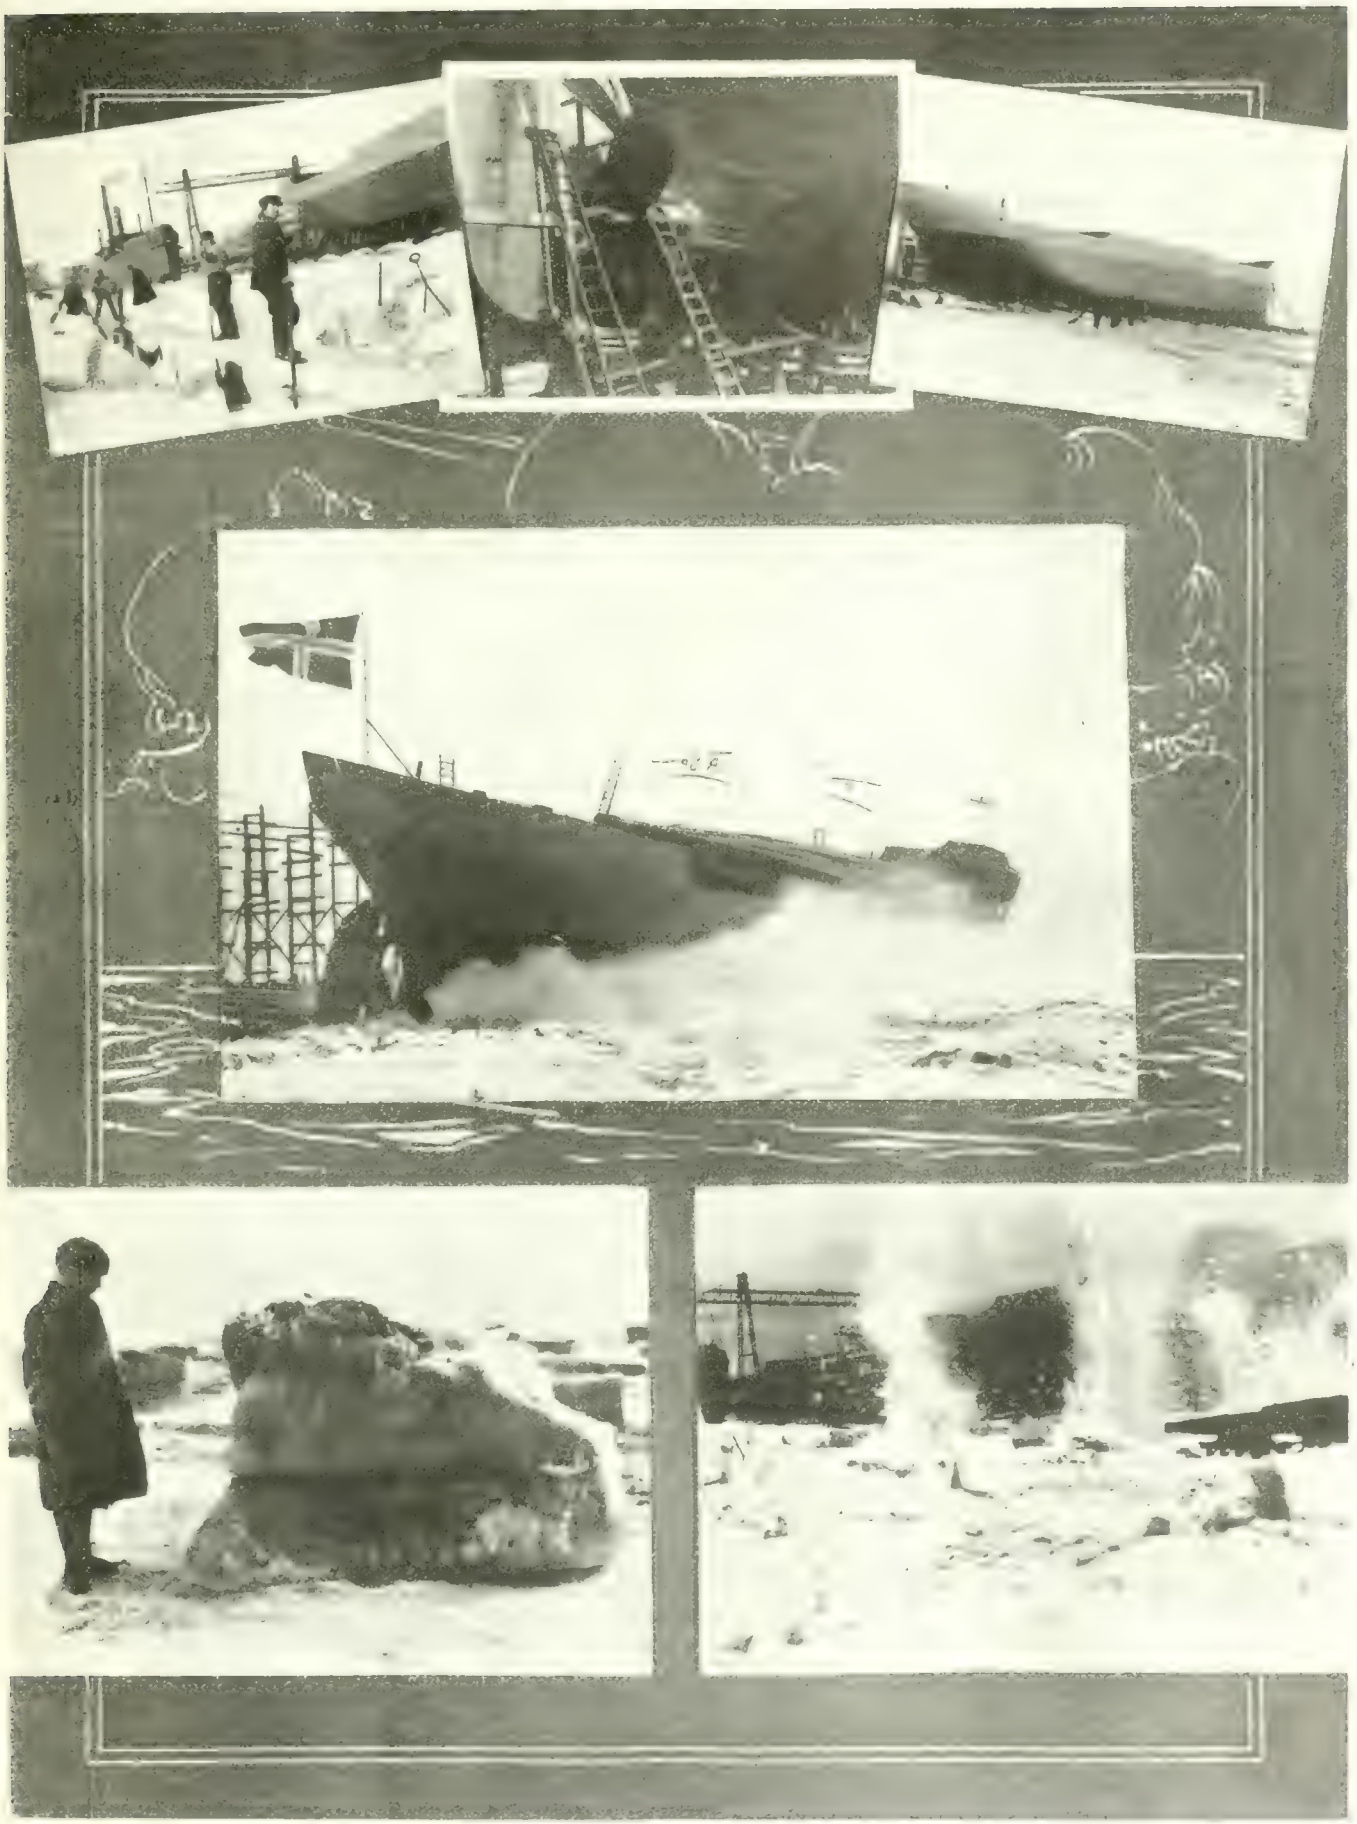
The boiler installation consists of two 14 ft. diameter by 12 ft. long, single-ended, Scotch marine type units, arranged for natural draft only, and built to pass Bureau Veritas requirements for 180 pounds working steam pressure. Each boiler has three corrugated steel furnaces of 42 in. inside diameter. The tubes are 3½ in. diameter, lap welded and standard gauge. A separate combustion chamber for each furnace and one double funnel are other features.

### Auxiliary Machinery Equipment

The pumping equipment includes deck pumps for each hold; vertical duplex, brass-fitted, main boiler feed pump; a duplicate of the latter for use as a general service donkey pump; duplex horizontal piston type bilge pump; a 7-in. duplex, brass-fitted, ballast pump; and a fresh water pump, 4½ in.—4 in.—5 in. of duplex type; air pump and centrifugal circulating pump for main condenser. The feed water heater is of multi-coil type installed in the feed pump discharge line. One 7½ k.w. Enberg electric generating set is installed in the engine room for the ship's lighting system. An evaporator of 15 tons capacity is also installed in the engine room.

### Deck Machinery

For handling cargo there are six 7 in. by 10 in. horizontal double cylinder steam winches of Clark-Chapman type, one at each mast and derrick. The



THE 2,000-TON STEEL FREIGHTER "ASP" TAKING THE WATER AT POLSON IRON WORKS, TORONTO. LEFT, [illegible]. THE BASIN IN THE ICE. BELOW, DYNAMITING ICE IN ICE TO ALLOW VESSEL FOR BOAT ALREADY ENTERING WATER.

[illegible] and are placed on girders above the deck. Each mast carries one 3-ton [illegible], the latter being enough to land cargo 10 ft. away from ship's side. The windlass is of direct-acting type for operation by hand, as well as by steam, and is complete with reversing gear. A hand screw steering gear is installed aft, and a steam steering gear amidships. The total bunker capacity is about 350 tons.

## TO USE BITUMINOUS COAL MORE EFFICIENTLY

AT the present moment, when the fuel situation forces itself upon the attention of every householder in the country, any discussion of the coal problem that goes into the causes at the bottom of the present unstable and unsatisfactory state of affairs should receive a careful and serious hearing. Especially so if at the same time this discussion is constructive and points the way to a rational development of the vast coal resources of the nation so that they will not only meet adequately the demands of a growing industrial development but also will be firm and strong enough to stand the shock of untoward events. It is evident that their present development fails now the test of world emergency.

Such a discussion is to be found in a short bulletin by Chester G. Gilbert, entitled "Coal Products: An Object Lesson in Resource Administration," just published by the United States National Museum, and constituting the third paper of the series, "The Mineral Industries of the United States," in course of issue by the division of mineral technology of this institution.

### American "Lack of Analysis."

The author at the outset points out the magnitude of the coal resources of the United States and the utter dependency of national welfare upon their proper development. Yet with more coal than is found in any other country, or indeed on any other continent, this country has long been dependent upon foreign sources for such essential products made from coal as dyestuffs, fixed nitrogen, and many important drugs; and is to-day, with the first pinch of war stress, uncertain whether the fuel needs of the American home can be met even during the coming months. With characteristic lack of analysis, the American public has never faced these shortages in phases of a single problem, but has first become alarmed at the dye shortage, then excited over the nitrogen dearth, and is now shivering in anticipation of a meagre fuel supply.

### Output Inadequately Used

To explain the present coal shortage by transportation congestion or labor difficulties is to offer a superficial cause. These dilemmas, of course, are the concrete means through which the trouble makes itself felt, but back of them stretches a far-reaching failure to work out a proper development for America's greatest resource. The trouble is not that insufficient coal is mined and transported but that the present output is inadequately used its full commodity value is not obtained. In general, our coal could be made to go a third further in meeting the nation's needs.

The domestic fuel stringency is only one angle of the coal problem, but a very distressing angle for the average person. The trouble here is the fact that the demand put upon anthracite, or hard coal, which is practically limited in occurrence to a few counties in Pennsylvania, is out of all proportion to the size of the deposits. The homes of the country must begin to turn aside from the luxurious and costly anthracite and look more to our vast bituminous resources, which are widely distributed, favorably situated, and can not so readily be tied up by concerted strikes or so easily held down by traffic congestion. But bituminous coal is dirty; and its widespread utilization as such would be a long step backward, retarding progress in civic betterment as well as involving a 30 per cent. waste in commodity bulk.

### Saving by Proper Usage

This waste, however, which appears in the guise of smoke, is in reality convertible into gas, tar, ammonia, benzol, and an endless number of other by-products, such as dyes, medicines, and explosives. It is therefore possible by proper shaping of economic policy to remove the disproportionable drain on the limited supply of anthracite, to turn the wasted third part of bituminous coal into useful products, to eliminate smoke from our cities, and to so distribute the sources of domestic fuel supply as to alleviate, if not entirely solve, the labor and transportation perplexities of the present situation.

These desirable results are already in course of natural development, but progress is disastrously slow, impeded as it is by lack of proper stimulus and excess of misdirected pressure. The advance so far has been solely in the metallurgical field. For converting iron ores into metallic iron, a substance known as coke is needed. This is made artificially from coal by driving off its volatile portion, its smoke, so to speak. Almost a seventh of our coal is made into coke, so great are the demands of the iron industry, but two-thirds of this coke is produced without regard to saving the valuable products driven off during its manufacture. Therefore we face the alarming conclusion that only about 4 per cent of the coal mined in the United States yields its full value to society.

### More Coke Needed

Progress in coal utilization depends fundamentally upon the production of more coke. At present the situation is limited by the needs of the iron industry. The quantity and type of coke thus far produced has been determined by its metallurgical use. Sporadic attempts to apply metallurgical coke to household purposes have met with failure and placed coke in an unfavorable light. Coke must be made of such kind as to be suitable for domestic use. This can be done; and the accomplishment is an urgent necessity. Domestic coke, in reality, will be artificial anthracite.

There is room in our industrial system for a greatly changed utilization of coal; in short, for coal to be used in the form of anthracite, artificial anthracite (domestic coke and steam-engine coke), metallurgical coke, gas for illuminating and power purposes, benzol for automobile engines, and at the same time made to yield a sufficiency of nitrogen, dyestuffs, explosives, and other coal-product chemicals. There is present need for all these products. The problem is to make the necessary readjustments.

The solution of the whole coal problem, in short, does not consist in cutting down industrial activities to meet present coal output, nor in circumscribing the scale of economic life to fit present misdirection of coal resources, but lies in working toward an industrial situation that will both permit and demand a widespread treatment of bituminous coal so as to yield on the one hand a smokeless fuel, an artificial anthracite so to speak, suitable alike for the home and the factory; and on the other a host of by-products essential to the industries of the nation.

## RESISTANCE OF AN OIL TO EMULSIFICATION

WHEN oil is used over and over again, as is the usual practice in large power plants, it may emulsify in a few days, if it is not of good quality, and have to be thrown away, as it will not pass through the filters. In order to arrive at a definite knowledge of the emulsifiability of oils, the United States Bureau of Standards has carried out investigations, the results being embodied in Technologic Paper No. 86, entitled "Resistance of an Oil to Emulsification."

To avoid the waste of time and the inconvenience of actually trying the oil in a turbine or other machine, a laboratory test has been devised by means of which it may be predicted whether or not the oil would give satisfaction in service.

The test consists of violently stirring a small sample of the oil with water under standard conditions. Then the oil that will separate out from the water the most rapidly is the best oil for turbine lubrication, other things being equal. It is found that most of the oils on the market are either very bad or very good, and that there is no difficulty in finding turbine oils that will settle out from the water in a minute or less after stirring.

For some other purposes it is desirable that oils should emulsify readily; and the test shows that oils of this class, when subjected to the same treatment as the turbine oils, will not separate at all in one hour, nor completely separate in one year. When turbine oils are used for months or years without renewal, they gradually deteriorate until they emulsify readily, even though they are very good oils to start with. The conditions of use in different plants are so different that it would be impossible to predict just how long a given oil would last, but it is believed that any power-house engineer, by the use of this test, could keep track of the deterioration of his oil and thus discover when it is time to clean out his lubricating system.

# Fundamentals of Apprenticeship: National Interest Grows--II.

Special Correspondence *

*Industrial education is to-day the principal educational theme in this country. Employers, business managers, superintendents, thoughtful craftsmen, educators, economists, social workers, men and women in a hundred walks of life, have focussed their attention with growing earnestness upon the problem. Discussions, proposals and theoretical and practical experiments are gradually leavening the great mass of our industrial life.*

MOST larger concerns which have modern apprenticeship systems, provide study to supplement the work in the shop. It is recognized that the object of an apprenticeship system is to teach the boy a trade, and that the trade cannot be properly learned unless the boy knows the mathematics, mechanics, theories, and business methods which accompany the trade. This instruction is given generally in a schoolroom connected with the factory or shop.

### Practical Trade Training and Applied Technical Instruction

The great mass of industrial workers have only a certain amount of manipulative skill; the work which they perform is often meaningless to them. Modern apprentice instruction, by a proper correlation of practical trade training and applied technical instruction, seeks to impart a thorough all-round knowledge, not only of the actual manufacturing processes but the reasons that lie behind. Technical education, as combined with apprentice instruction, is simply the education necessary to enable a boy to become an intelligent workman—one who can see the principles underlying the methods of work—one who can give a reason for doing a thing in a certain way and who does not blindly follow a certain rule. Technical education is the mental training of the apprentice, so that his understanding may be fully awakened.

That there is great need of awakening this intelligence is easily seen, when one considers that most of the boys and girls who seek industrial employment are deficient in even the common fundamentals which are popularly called the "three R's"—reading, 'riting, and 'rithmetic, and this condition is not confined by any means to boys and girls, but extends likewise to older students.

Be that as it may, the employer is confronted with the task of securing his supply of beginners and junior workers from an untrained host, and if the findings in the published report of the Commission on Vocational Education appointed by the Sixty-third Congress are correct, or even approximately correct, that 85 per cent of all the children that enter the public schools of the country leave the schools before they reach the age of 16; that not over 8 per cent. of those who enter the high school ever get through and take the diploma; that not over 2 per cent. of those who are graduated from the high schools ever enter the college or university, and that hardly 1 per cent. of the 14,250,000 persons engaged in manufacturing and mechanical pursuits have had, or at the present time have any chance to secure adequate training in their chosen industry, is not the necessity of supplementing practical trade training with applied technical instruction imperative.

This conference board believes it is essential to the success of apprenticeship instruction to co-ordinate a careful system of class-room studies with shop training, arranging these studies on a definite schedule of time.

### Class-Room Work on Employer's Time

No employer should begrudge the time spent by his apprentices in class-room work, whether this time be spent in his own class-room or in the class-room of continuation schools.

In some states, and in places abroad, attendance at continuation schools is compulsory on certain classes of minors, and the employer is obliged to grant the necessary time for this study. But whether compulsory or not, employers should recognize the fact that class-room work is an important phase of apprentice instruction, and not only insist upon it, but also continue regular pay during specified class-room hours.

It is essential in a proper system of apprentice training that adequate instruction be given to the apprentice along every line, cultural, technical, and practical, and as the cultural and technical are only parts of the required instruction, and as all the instruction given is for the purpose of developing the apprentice into an economical producer, —a profit maker for the employer as well as a good [illegible] for time spent in class-room work, which awakens and develops the intelligence, and thereby creates a much higher degree of operative or manipulative skill, eventually becomes a profitable investment.

### No Financial Obligation of Apprentice

It has been said by an English writer upon "English Apprenticeship", that in all probability the Elizabethan system of apprenticeship was the most efficient and the cheapest system of training that was ever available for the masses of the English nation. The nation neither paid for class-rooms nor for teachers and inspectors, since the guildsmen served as inspectors, and master and boy entered into an agreement for their mutual advantage, which required no payment on either side. For although the apprentice received not only instruction, but board and lodging, there seems to have been no idea, when first the system of apprenticeship was developed, that the training and education, which it provided, should be paid for in money. It was upon the services of the apprentice, especially at the end of his term, that the master had to count for a return of his trouble and the lad's maintenance.

This was in early times; later on a change set in, and one of the complaints made against apprenticeship by eighteenth century writers was the heaviness of premiums charged by the masters upon taking apprentices. The payment of premiums, even became a governmental source of revenue, as a stamp tax of sixpence in the pound was imposed upon sums of fifty pounds or under, and one shilling upon sums of over fifty pounds, affecting the engagement of clerks, apprentices, or servants, placed with any master or mistress to learn a trade. The amount agreed upon had to be named in the indenture, and, as early apprentice history shows, if the master failed in his obligation to instruct, the court, upon presentation of satisfactory evidence, required the restoration of all or a part of the premium.

This old-world custom of the payment of a premium by the apprentice to the master or employer was transplanted to this country, and, although not practiced to the extent that it was abroad, was, nevertheless, a recognized custom for many years—in fact is, even to-day, practiced by not a few employers, who exact a premium from the apprentice under one of three general plans, namely,

(a) By cash bonus.
(b) By deferred wage payment, forfeited for reason.
(c) By tuition fee.

Regardless of the reasons which might properly have been set up for such charges in the past, no reason, aside from long-time custom, can be given for such charges to-day. A cash bonus, or lump sum payment, for the privilege of learning a trade, or the assessment of a tuition fee, has no place in modern apprenticeship system. Private trade schools, conducted for profit, or endowed industrial schools, may properly charge a fee for their instruction.

In reference to a deferred wage payment, this also should not be countenanced by employers. It has been the custom, and it still prevails in many places, of holding back a certain portion of the apprentice's rightful wage until

*Copyright, "Conference Board on Training of Apprentices."

[illegible] completed his apprenticeship and [illegible] presenting it to him in the form of a bonus. While this conference board recommends the payment of a [illegible] under present conditions, it does not believe it to be permissible in these modern times that any part of an apprentice's rightful wage should be held back as a coverage for lost or damaged tools, or other possible wastage; nor as a possible penalty for slackness or slothfulness; nor as a means of preventing the apprentice leaving before the expiration of his full time; nor as an installment deposit to assure faithful performance and good conduct; nor for any other cause.

If the apprentice fails to keep his part of the contract, either through carelessness, inherent ignorance, or wilfulness, the employer has but to dismiss him, thereby applying a condition of the indenture.

## THE RETURN OF THE SOLDIER TO CIVIL LIFE

THE process of rehabilitation necessarily involves a complete reversal of habit for the man at the front, and as military discipline trains a man away from individuality and makes an automaton of him for the best interests of concerted action in war, the system employed by the Invalided Soldiers' Commission in the conduct of the convalescent homes for returned soldiers is built upon the understanding that the whole action of a man's mind must be set in reverse if he is to be successfully remade into a civilian. To this end the "King's Rules and Orders" are reduced to the lowest minimum consistent with the welfare of the man and the good order of the institutions.

The military convalescent hospitals are subservient to the man himself. The esprit de corps is splendid and the men are encouraged to look upon themselves as citizens. The breach which may never be spanned between the officer and the man in the ranks in active service is bridged by confidence in the hospitals, a confidence born of heart-to-heart talks in which the man is made to feel that the officer is representative of a civilian government interested in him as a citizen and anxious to see him successfully restored.

### Encourage Initiative

Evidence of the Commission's desire to help the man regain his normal attitude toward life is evident in every phase of its work. The relentless training away from independent action during the long months and years of military service must be broken down, and the man urged to exert his initiative. To this end every facility for popular games has been provided in the hospitals, and recreation halls fitted for dramatic entertainments and musical programmes built. It is a common sight to see the officers and men playing with and against each other in sports.

Through these agencies the men are encouraged to exercise their talents, and the zest of competition sharpens the dulled sense of individuality during convalescence. Vocational training rooms cultivate the same tendencies, and while the manual work is looked upon by the medical officers as primarily curative exercise, it is none the less important for its psychological effect.

### Outside Influence Carefully Directed

Undirected, the interest of different patriotic clubs in the hospitals resulted in an unequal distribution of favors and often ill-considered gifts. To co-ordinate the efforts of the organizations who desire to help in the "humanizing" of the convalescent homes the Commission has established soldiers' comfort branches in the most populous units of the command through whose administration the generosity of the citizens who desire to do something for the returned men is directed into the best channels.

These committees have learned the needs and desires of the men and convalescent homes, and requests for suggestions coming from organizations which desire to help make the lives of the men brighter during their convalescence are met with an exact knowledge of the gifts which would be most welcome. In this way economy in effort has been effected and the maximum of pleasure attained for the men. All members of the comforts committees are volunteer workers.

As the result of their work, cheery chintz curtains have been hung, flowers have filled the wards, cards, games, cushions, smokes, candy, fruit, billiard tables, reading lamps, socks, surgical dressings and Red Cross materials, entertainments, picnics, motor parties, dances, and hundreds of individual desires have been realized without cost to the government.

### Movie Machines

The Commission in its earliest days made provision for the purchase of moving picture machines to be established in the convalescent hospitals. In many instances there are two machines—one to operate in the big recreation room or theatre and a second smaller one for use in the wards where bed patents are confined. The Commission has made arrangements with the various film organizations to supply a certain number of films per week to the institutions.

Lecture courses have been arranged in many of the hospitals during the winter months in which some of the most prominent business men, educators, and lecturers are appearing. This widens the horizon of the man, and in turn brings the returned soldier before other public meetings at later dates when the lecturer, qualified by his inspection of the hospitals which he visited and impelled by the interest close contact with the men inspired, tells of the work of the Commission and the problem of rehabilitation.

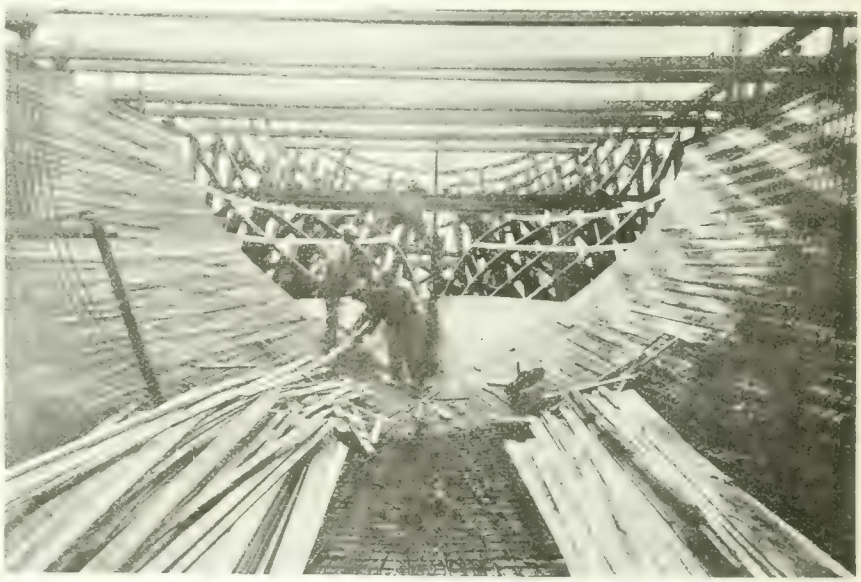
### Interesting "Big Business"

In the middle west one alert commanding officer has made a practice of inviting groups of business men of common interest to luncheon at the convalescent hospital. Before lunch an inspection of the buildings and workshops is made, and with coffee, cigars and after luncheon chat, suggestions are solicited. Questions are answered and the men go away with a new and more intelligent interest in the returned soldier problem and many times voluntarily pledged to arrange to take returned soldiers into their factories.

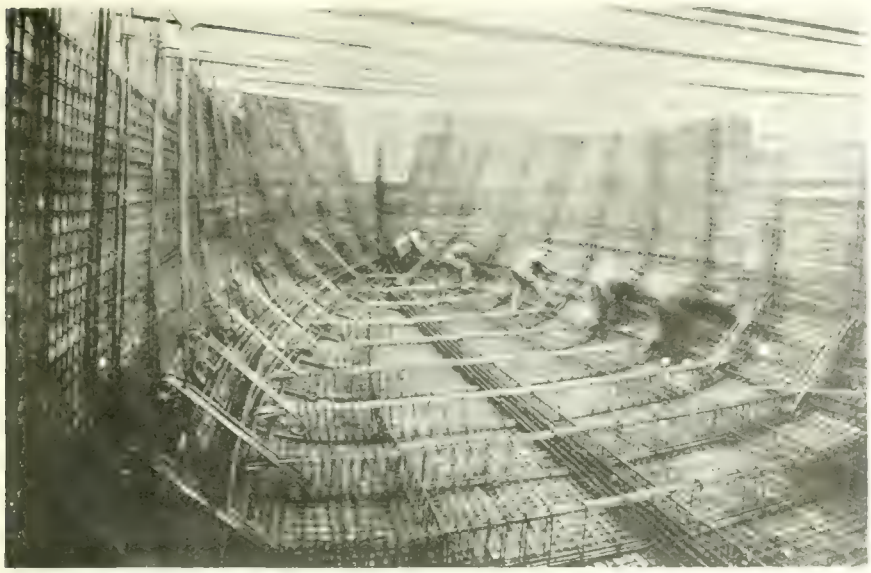
## CONCRETE BOAT BUILDING IN SPAIN

SPAIN, the country in which Columbus contrived to get enough money to buy and equip three wooden boats which were used in a little sea jaunt of more or less historic interest along about 1492, has turned to concrete as a shipbuilding material in 1918.

The corporation known as Works & Pavements, of Barcelona, Spain, has accomplished in a relatively short period of time some of the most important public works of reinforced concrete and in view of the developments that it believes will take place in maritime construction has at the present time a



VIEW SHOWING THE PLACING OF THE FORMING AT STERN



VIEW SHOWING THE REINFORCING STEEL AT BOW

course of construction the first cargo boat in this field, some details of which will be seen in accompanying photographs. This ship, while the initial attempt of this kind of this firm, nevertheless led it to make plans for the construction in 1918 of a gross tonnage of 40,000 corresponding to a displacement of 70,000, and consisting of standard type ships of 300, 500 and 1,000 tons each. Next year they propose to extend their operations and to provide for enlarging their plant have acquired an additional site on the shores of the Mediterranean, having an area of 250,000 square metres with 2,000 metres water frontage. This will permit them to provide ways for the carrying on of the construction of 30 boats at the same time; some of which are planned to be of 6,000 tons capacity.

The company has acquired various patents that will permit it to build rapidly and economically reinforced concrete ships.

It has also been proved that algae and the various forms of sea growths that are developed in sea water may be removed from the surface of concrete very easily.

## A NOVEL SCHEME FOR WRECKING OLD MASONRY

THE expansive force of quicklime has lately been used in breaking up brick [illegible]. It was necessary to remove three foundation piers, each 12 ft. by 20 ft. in area, and 12 ft. high, and similar piers supporting working engines on each side prevented blasting. Cutting and breaking up by hand being too slow and expensive, the new method was tried. Vertical holes three inches in diameter and three feet deep were drilled three feet apart in both directions, and were filled to within six inches of the top with quicklime, fresh and well slaked. Water was poured in and the holes were closed with brick dust, well tamped. Cracks started in ten minutes and soon broke the pier top into three foot cubes, making subsequent hand operations easy.

## STANDARD SPECIFICATIONS FOR MARINE ENGINES

MESSRS. RICHARDSONS AND WESTGARTH, LTD., Hartlepool, have recently issued a copy of their standard specifications for triple-expansion marine engines. This specification is in accordance with the north-east coast guidance specification published this year.

Included in the volume is further interesting and valuable matter. One section gives the north-east coast standard outfit, another the standard demarcation of work between engineers and shipbuilders, whilst in a fourth section the Contraflo system of auxiliaries is described in detail. The volume concludes with a reprint of the North-East Coast Guide Specification. The publication should be of interest to many readers.

## EDITORIAL APPOINTMENT

[illegible] editorial staff of this journal has been augmented by the appointment of A. R. Kennedy to the position of associate editor. Mr. Kennedy was formerly managing editor of the Quelph *Daily Mercury*, and is well and favorably known in Canadian newspaper circles.

# IT'S WHAT YOU DO TO-DAY

*It won't be good to talk of what you [illegible] to be, [illegible] when you've control in regal life. You can't [illegible] dreamed once espoused with ease.*

*The queen and the catcher were one [illegible] ribs that's ten feet tall.*

*And what's the use to tell [illegible] and a barn—or that some other [illegible] high he pulled a spell of gout.*

*Who talks don't care a heck to know [illegible] slid beneath the mill.*

*A hen may have a pedigree that's sixteen feet in length, and all her rooster brothers may crook with all their strength—but how's that feeling [illegible] eggs about as small each.*

*A race horse has a [illegible] all the barnyard talk.*

*But if that bob comes to the scratch to beat all other nags, with jockey decked upon her back in all his fellow rags, [illegible] what's the use of all her [illegible] though she's tied unto a tree?*

*It's just the same as [illegible] or not.*

*It won't the things you said [illegible] what you've done; what's past and done there's only one thing that [illegible] will take you, right or wrong, at what you're worth to-day.—ARK.*

# CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper devoted to the machinery and manufacturing interests.

J. M. WILSON, Editor B. G. NEWTON, Manager

Associate Editors

J. WEBSTER J. H. ROGERS W. I. SUTHERLAND

A. R. KENNEDY

Office of Publication, 148-153 University Avenue, Toronto, Ont.

Vol. XIX. FEBRUARY 14, 1918 No. 7

## CONSCRIPTION OF LABOR

HON. J. A. Calder, speaking at Massey Hall, Toronto, on February 26, intimated that non-essential labor might be taken from the cities, and used on the farms.

Coupled with this should go the determination to see that the farmers now on the farms farm the land. The cry, "I am a farmer," was most persistently used and abused before every military tribunal that held a session in any rural part of the Dominion.

It is known as a matter of absolute fact that farmers' sons, after the tribunal sessions were over, applied at city factories for work, showing exemption papers. These papers were granted to Class "A" men because they were farmers. As soon as the storm blew over they returned to the city under the smoke barrage of an exemption paper granted on the ground that the applicant was a farmer.

Another case is known where a son left the shop in the city as soon as the Military Service Act began to look dangerous. He went back to the farm. He became friendly with the plow handles, and was once again on speaking terms with the barnyard.

But what? Could that good job of his in the munition plant be allowed to go to seed? Not much. His father left the farm and went to work in the place of the son in the factory. The father was a better farmer than the son. The cause of increased production had suffered and the army lost a soldier.

The country will back up any effort to put men on the land, but enough care should be exercised to see to it that this sort of hide-and-seek business is ended at once.

## DON'T TRY FOR AN AVERAGE

ONE point that is being persistently emphasized in connection with the making of shells is that each shell must pass on its own merits.

That's quite an acid test to apply to many other things besides shells.

It simply means putting the hundred per cent. efficient measure up beside everything you do.

It's the very opposite to the theory of getting past when the crowd's going through.

A man may have some good qualities. He may have some bad ones as well. His friends put the good and the bad together, and a process of mental juggling turns out the verdict that he's not such a bad sort.

You can't juggle with good shells and bad shells and produce a carload of shells that, on the average, are fairly good.

Why not apply this to your work—to your business? If you've got weak spots in your organization—if there are limping traits in your own character—don't depend on something that's stronger to come along and strike a decent average.

Put the shell test to it. Good or bad. Which?

Get the crutches out of your system—out of your organization. In the last analysis there can be only two big classes, (1) efficient, or (2) non-efficient.

## MINERS DIDN'T WANT THEM

THE Amalgamated Mine Workers of Nova Scotia did not take kindly to the idea of having Chinese labor employed in the mines with them in order to increase the output.

The Fuel Controller brought up the matter of Chinese labor. The mine workers turned it down.

The Controller offered to allow them to collect a sufficient sum from the Chinese to pay their fare back to China as soon as the need for their services was over. The miners did not entertain this proposition for a minute.

It can hardly be urged that Chinese labor is being received with the open-arm policy in the Dominion.

At the recent meeting of the Ontario Experimental Union held in Guelph at the O. A. C., Dr. Creelman, Commissioner of Agriculture for Ontario, put out the same suggestion. He was of the opinion that the big chance to relieve the labor situation lay with the Chinese coolies.

It was apparent that Dr. Creelman put the suggestion out simply as a feeler. To be quite frank, the response in the agricultural world was at zero.

Agriculture and mining camps are generally favorite pursuits for the Celestials where they are allowed to operate. These two doors have been closed to them here to all intents and purposes.

Canadians don't seem to mind if the Chinese do come in and paint laundry tickets for them. Apart from that their reception hasn't been particularly cordial.

## A SHIPBUILDING NATION

NOT long ago it was considered right and proper to refer to Canada as the "granary of the Empire." There is, of course, nothing wrong about this. The name got its origin in the time when the west was making such strides in development.

But Canada is going to be more than a granary. The Dominion is a machine shop as well.

The Dominion is also striking a pace as a shipbuilding nation that will make one wonder in a short time whether the agricultural interests are not going to be hard pressed to maintain for all time to come their outstanding superiority.

In 1880 the tonnage built in Canadian yards was 65,441. In 1918 it is estimated, on a very conservative basis, that the total tonnage will be 400,000.

A point is raised in connection with the new shipbuilding industry that should not be missed. When there is a rush for any given product, the tendency invariably is to open up new plants, and in this way increase the output.

Keep this in mind—**the big demand now is not for more shipyards, but for more finished ships.**

To establish new yards would simply mean drawing off or lessening the number of men available in each yard, as the supply of men who have the training and skill for this class of work is limited.

The more the men are spread about the fewer the ships that will slip into the water in a given time.

Under the stress of the times it is easy to see that it is much more important to get a few ships into service than have a large number under construction, and none of them immediately available for the work which is so imperatively urgent.

# ANOTHER AMERICAN IS MAKING GOOD IN CANADA

**Mr. W. H. Burgess Is Now Vice-President and Gen. Manager of the Canadian Business of the International Malleable Iron Co.**

"WE DO not anticipate any particular after war problems in connection with our business," stated Mr. W. H. Burgess, vice-president and general manager of the Canadian business of the International Malleable Iron Works at Guelph. He discussed the business situation at some length with a representative of CANADIAN MACHINERY, outlining that the policy of their Canadian business had not been interfered with on account of the war trade. They had not gone directly into the manufacture of munitions, although firms with which they did business had made use of much of the output of their Guelph shop for this purpose. "The first two years we did business in Canada the skidding was a little rough in spots," remarked Mr. Burgess, "we were just getting started when we ran into war conditions, but it has been our policy to stay close to the lines in which we specialize, and we have not departed from it. About 40 per cent. of our business is castings for agricultural implements, and this is developing very nicely. Then 30 per cent. will be taken up in the making of our own line of fittings, while a good deal of the remainder is now taken up with the turning out of castings for several of the large Canadian makers of motor cars.

W. H. BURGESS

### Started in Foundry Work

Mr. Burgess is a native of Lynn, Mass., where he received his early schooling and training. At the age of twenty he entered the foundry of the Laconia Car Manufacturing Co. He had not been in this shop over a year before he was deputed by the superintendent to work out an improved cost system for the foundry end of the business. Five years later Mr. Burgess went to Wilmington, as assistant superintendent of the Malleable Iron Works there, his next promotion being to the position of general superintendent of the Malleable Iron Co., of Trenton, N.J.

His next move was the one that brought him with the firm that was the direct cause of his coming to Canada. Joining the staff of the International Iron Co. of Chicago, he was selected as the man who should take charge of the erection of the plant in Guelph. It was in March of 1913 that the Canadian business was opened. The industry has proved a good one for the city of Guelph. To-day the plant has grown to the stage where there are 375 employees on the pay roll, and we learn from sources close to the International Malleable Co. that the growth of the Canadian business is ascribed in business and trade circles to the sound judgment and sane policies followed by Mr. Burgess and those associated with him.

### Apprentice System Gone

Discussing business in a broader field, Mr. Burgess remarked: "The apprenticeship system is almost a thing of the past now, and I suppose it will continue that way until the war is over. It is rather difficult to make a boy see that it is to his own best interest to stay at his trade, rather than turn to an abnormal occupation that will pay him big money for a time from the start, but which in the end may result in him turning out a laborer or a handyman rather than a skilled mechanic. I believe firmly in the machine shop and foundry training for the man who intends to follow the iron or any other business, and in normal times it can still be successfully worked and will give good results."

In common with all manufacturers, the International Malleable Iron Co. are having troubles of their own in getting supplies through. "It has often occurred to me," said Mr. Burgess in conclusion, "that there is a chance for a great deal more co-operation between the trade department of the government and the Canadian manufacturers. Our experience has been that there is too much effort in general, and not enough of the direct application kind, and this is needed if the Canadian firms are going to go in and take the place they should in the development of an export trade following the war."

Mr. Burgess likes Canada, likes Guelph, likes the Canadians, but that does not prevent him from having a very warm spot in his heart for all things Bostonian. He continues to drop his "r" and would rather eat baked beans than turkey. Guelph puts him down as a first-class citizen, and would like to get a whole lot more like him.

---

### WISE AND OTHERWISE

THE price of boots goes up. The price of trousers has joined the procession. Henry Ford shunts the price of his car. Hence, the H. C. of L. has got us, going, coming, riding, walking, standing or sitting, so what's the use?

ACCORDING to the style notes for spring they do tell that the pinch-back suit is going to pass out. But the price we're paying for everything we eat will make it certain that the pinch will simply be transferred to the front.

* * *

IN A book issued on engineering matters in 1882, giving the cost of construction for certain classes of work, we come across this line "Labor at $1 per day." There were giants in them days.

* * *

THE greatest boom the "Made-in-Canada" movement can get is a reputation that the goods give one hundred cents value for every dollar invested. The quality will remain long after you've forgotten about the price.

THE Russian Bolsheviki have a great idea of financing. They borrowed all they could, and now repudiate all their liabilities. If the Bolshe can do this successfully it will be an awful temptation to many another hard-up to take a chance on the same plan.

# Prospects of Continued Munitions Activity in Canada

*Supplement British Shell Orders—Government to Fully Utilize Shipbuilding Resources—Improved Conditions in Steel and Allied Industry—Metals and Machinery Quiet*

IT is not unlikely that further orders for munitions will be placed with Canadian manufacturers by the American Government which in conjunction with the Imperial Munitions Board contracts will result in considerable activity and the expenditure of large sums of money. Capacity shipbuilding production in Canada is probable this year for it is the intention of the Dominion Government to build ships to the full available capacity of the ship yards. All this indicates great activity in the steel and metal working industries during the present year with the result that Canada will benefit as a whole. Steel manufacturers are reaping the benefit of more favorable weather and production will show a steady increase during the coming weeks with the result that normal conditions should soon prevail. There is yet considerable freight congestion on the railways which will not be entirely eliminated for some time owing to the car shortage, but with a continuance of favorable weather, traffic conditions will materially improve and the steel plants benefit accordingly. Merchants report business as being fair but are hampered by slow deliveries and delays in having to obtain permits before material can be shipped. Prices are holding firm and are unchanged. In the United States conditions in the iron and steel trade are improving and production is increasing. An effort is being made by the leading steel manufacturers to have prices increased when the schedule comes up for revision. The scrap metal market continues quiet with little business passing. Consumers are still under the impression that prices will decline. In the non-ferrous metal markets the outstanding feature is a sharp advance in tin due to the great scarcity and unfavorable outlook. The copper market is quiet but it is possible that the price will be raised to 25c in the States to cover increased production costs. Prices of machine shop supplies are holding firm and business continues in good volume. Solders have advanced because of the high cost of tin. Some styles of wrought pipe are higher but the standard lines are unchanged. The machine tool trade is fairly active, chiefly in single tools for munitions plants and shipbuilding.

MONTREAL, Que., March 4, 1918.—Freer movement upon the railroad and a corresponding relief in the congestion of freight has put a more encouraging tone in the industrial situation, the chief factor being the improvement that has developed in the weather, enabling the distribution of material to be made with greater regularity. Considerable disorganization, however, is still evident, and will likely continue for some time yet, as the heavy snows about the country will prevent the complete return to normal until early spring. Shipments of materials from points in the United States are becoming more regular. The feature of the moment is the progress that has been made regarding marine development. During the past 12 months the total value of shipbuilding contracts placed by the I. M. B. is approximately $64,500,000. This has been the biggest year in the history of Canadian shipbuilding; 46 wooden vessels with an aggregate tonnage of 128,000 tons, and 43 steel vessels with an aggregate tonnage of 211,300 tons are the most important part of this programme. At least 8 steel and 4 wooden vessels have already been launched and many others will be ready to take the water when navigation is opened, or when the ice in the rivers is sufficiently removed to permit of launching. The total tonnage output for the present year is estimated at 400,000 tons.

### Steel

Weather conditions have been more favorable during the past week and transportation difficulties are becoming less pronounced, with the result that mills are looking forward to better production. So far, however, the betterment has only been shown in slightly increased output, as the demoralization of the entire steel industry has been so general that some little time will be required before normal operating conditions can again be resumed. Car shortage is still the dominating factor and many of the mills are working, under great difficulties. In some instances, producers who are operating two or more mills have temporarily closed one of them so that the others could be kept working nearer to capacity. The lack of sufficient coal and coke continues to be a constraining factor. Steel manufacturers in the States are conferring with officials of the Government with the purpose of readjusting and re-establishing the prices as now fixed on semi-finished steel products, the date fixed for any change that may go into effect being April 1 next. The consensus of opinion among steel dealers appears to be that any revision of prices will be in an upward direction. The gradual but steady increase in the cost of production is one of the main factors in the recent negotiations, as producers are anxious that prices on different steel commodities should be more stable in character. Before the close of the current month it is anticipated that adjustment will be made that will be more agreeable to steel producers, and also consumers, as the latter are apparently willing to pay slightly higher prices, provided they are assured of more definite delivery. Open inquiries for the requirements of Canadian shipbuilders have been discontinued, as the steel for all vessels constructed in the Dominion, under Government contract, will be purchased through the American Government. In anticipating increased plate production, activity has been stimulated along lines that have been dormant for some time; many oil companies are showing added interest and inquiries have consequently resulted. An urgent need for better car service is shown in the coal regions, as operators claim that another fuel shortage may be faced unless increased facilities for handling the output is an early development. The local market is devoid of features as dealers report a situation unchanged by recent developments with quotations holding firm. Dealers here are looking for improved conditions within the next few weeks. Indications point to a revision of existing prices in the near future and the probabilities are for quotations of a higher character. Recent changesin the freight tariff have resulted in a higher rate on steel products, the rate from Pittsburgh to St. John, N.B., 38.1 and 50.5 cents per 100 lbs. and to Halifax 39.1 and 51.5 cents per 100 lbs.; these quotations being for car lots and less than car lots respectively.

### Metals

Apart from the abnormal condition that still exists in the tin situation, the metal market has developed no feature of particular interest. The situation on the whole is becoming steadier owing to the relief that has been given to the transportation of material on the various railroads, a factor that has resulted in better production and delivery from the refineries to the trade. Copper is steady and firm. Tin is abnormally strong due to the pronounced scarcity of spot metal. Spelter is not active but has a stronger tone. Lead is quiet but firm. Antimony and aluminum are unchanged and quiet.

**Copper.**—In the copper situation there are few interesting developments to report and the market is comparatively quiet and steady. The bulk of the present production is being absorbed by the Government requirements for war pur-

poses so that with few exceptions the domestic consumer is experiencing considerable difficulty in obtaining metal for his normal operations. The American situation is still controlled by the fixed price of 23½c but the trade are looking forward to another revision in prices about the first of June. The market locally continues steady in character and quotations are unchanged at the price quoted last week of 31 and 32c per lb.

**Tin.**—This metal continues to hold the center of interest as the difficulties surrounding the shipments of metal from the source of supply make the market one of extreme uncertainty. The great shortage of metal on this side of the Atlantic has kept the situation in a very nervous condition which has been reflected in the quotations that have been soaring during the past several weeks. The market in New York is very unsettled and nothing definite can be learned as to the actual condition of the market. The nominal price as now asked reaches as high as 85c per lb. Dealers here are reporting a very strong and unsettled situation with supplies very limited. Some dealers have asked as high as 93½c per lb., but the average quotation might be considered at the nominal price of 90c per lb., this being 8c above that of last week.

**Spelter.**—The market is quiet but slightly more active than a week ago. Brass interests are apparently not heavy buyers and are not inquiring very heavily for the covering of their future requirements. The local market is a little stronger and the demand is steady. Dealers here are quoting 11½c per lb., an advance over last week of ½c per lb.

**Lead.**—On a slight increase in the demand for lead the local market has shown a better tone. Dealers here are asking 10½c per lb., an advance over last week of ½c per lb.

**Antimony.**—On decreased demand the market has developed an easier tone and dealers are reporting an undertone of weakness; quotations remain unchanged, however, at 18c per lb.

**Aluminum.**—A slightly firmer market has been shown from the better demand but prices remain unchanged and firm at 55c per lb.

### Machine Tools and Supplies

The demand for machine tool equipment, during the past week, has been comparatively light and inquiries for machinery are light in character. Some little business has been done in connection with munitions equipment but purchases of this class of machine tool, while comprising considerable volume of the total business, is nevertheless much lighter than has been shown for some time. Delivery of equipment, particularly that coming in from the States, is still a feature of much importance and users are experiencing considerable difficulty in obtaining such requirements as are necessary to be brought in from the States. Machine builders in Canada are quite busy, but the activity has fallen off from the abnormal conditions of the corresponding period of last year.

### Scrap

No development of importance has taken place in the scrap or old material situation and the general activity has been below normal. The railroad congestion that has been a feature of the recent market is still more or less a factor in present relative dullness, as the relief has not yet had the effect of removing the uncertainty that continues to dominate the situation. Supplies in dealer's yards are still low as railroads are still experiencing some little difficulty in meeting the full requirements of the iron and steel trade, owing to the large accumulation of freight that has piled up during the past several weeks. Gradual improvement in this connection is, however, practically assured and dealers are looking forward to more stable conditions in the operation of the old metal market. While dealers here are expecting some little changes in the price of certain materials the quotations this week are relatively the same as those of a week ago, although under some conditions the prices may vary slightly one way or the other but those prices quoted are the nominal figure asked in the majority of cases.

### CANADIAN GOVERNMENT WAR PURCHASING COMMISSION

**The following gentlemen constitute the new war Purchasing Commission. Sir George Foster, Minister of Trade and Commerce; Frank P. Jones, Montreal; J. W. McConnell, Montreal; James H. Gundy, Toronto; Charles McNaught, Toronto, and Joseph Gibbons, Toronto. C. A. Magrath, as Fuel Controller, and Hon. H. Laporte, as chairman of the War Purchasing Commission, are members of the board ex-officio. Sir George Foster is Chairman of the Board.**

## Toronto

TORONTO, Ont., March 5.—The outlook in manufacturing circles this year looks decidedly promising, particularly in regard to shipbuilding and munitions. Under the Dominion Government programme all berths as they become vacant will be used for Government ships, and it is hoped that tonnage laid down this year will be in the neighborhood of 400,000, providing, of course, that a sufficient supply of men and materials are available. In this connection there will be a good demand for ship machinery and fittings of all kinds. It appears probable that there will also be considerable activity in the munitions industry. There is a probability of further contracts for munitions being placed with Canadian firms by the American Government.

### Iron and Steel

The general situation in the iron and steel trade is gradually improving, but business is being interfered with by delays incidental to the necessity of obtaining shipping permits, and also because of the freight congestion. The permit situation, while being necessary, due to conditions arising out of the war, is nevertheless a handicap in the efficient conduct of business. No iron or steel can be moved either from mill or warehouse without permission from Ottawa, and, of course, no material of any sort or description can be shipped from the States without authority from Washington. There is consequently considerable delay in getting material shipped from this reason alone. Traffic conditions have improved on account of the more favorable weather, but the shortage of cars continues to be the most important factor in the situation, and it will be some time before any material relief can be looked for. Merchants report steel business as being fairly good in connection with non-war industries, but are hampered owing to the unusual conditions prevailing in the trade. There have been no price changes this week, and the market continues firm.

Operating conditions are steadily improving and production is increasing as a result. The improvement should be progressive now that the worst part of the winter has passed, and conditions soon be normal. There will be a feeling of relief as well as satisfaction when production reaches capacity, as steel is badly needed for war work as well as for the so-called non-essential industries. The Dominion Government is understood to be getting all the plates required for the first lot of ships that are being laid down under the Government programme. The material is being obtained direct through the War Purchasing Commission. The sheet mill which the Steel Company of Canada has installed at Hamilton is operating successfully, with an output at the rate of 20,000 tons of sheets per year. The quality of the sheets is said to be quite satisfactory, comparing very favorably with the best brands from England or the United States.

The leading steel manufacturers in the United States are agitating for an increase in the new schedule of prices, which will go into effect on April 1. Increasing costs and alleged unprofitable contracts will, it is thought, result in the manufacturers' committee advising the War Industries Board that a scaling upward in prices would be warranted for the new period of fixed prices to prevail after March 31. The prevailing prices on steel products became effective on September 24 last, and were reaffirmed on January 1. The steel market awaits with the greatest interest the decision on fixed prices, and it is hoped that the Government will make the next term extend from six to nine months, as it is believed such action will encourage more confident buying by domestic consumers.

### Scrap

There is no change to report in the

on account of the shortage of tin. Consumers still hold to the belief that prices will come down, and because of this they are not buying except hand-to-mouth to satisfy immediate requirements. The freight situation was improving until an [illegible] movement of material.

### Machine Tools

The machine tool market continues quiet, business consisting principally of single tools for munitions plants and heavier machines for shipyards. In regard to the latter there is a fair demand for second-hand equipment. The Dominion Shipbuilding Co. is buying equipment for the new plant on the harbor front. The Curtis Aeroplanes and Motor Co. has taken over the Toronto Furniture Co.'s factory on Dufferin Street and will instal equipment for manufacturing aeroplanes. The Russell Motor Co. are said to have secured a contract for fuse parts from the American Government. It is understood that further orders for munitions are being placed with Canadian manufacturers by the American Government and increased activity is looked for as a result of these orders. It is reported that orders for larger shells than the 75 M.M. will be placed in Canada.

### Supplies

Prices of machine shop and mill supplies are holding steady and firm, while dealers report a satisfactory volume of business. Deliveries of goods manufactured in the States are rather backward, but on lines made in Canada the situation in this respect is improving. New net list prices have been issued on wrought pipe, which provides for higher prices on certain styles of pipe. Standard buttweld and standard lapweld pipe remain unchanged in price. Standard lapweld genuine wrought iron pipe, S/C, shows an advance on sizes 4½ in. to 8 in., both black and galvanized, while extra strong genuine wrought iron pipe, P.E., shows an increase in price in sizes 4½ in. to 8 in. The United States Government has placed an embargo on shipment of higher grades of all refined oils. This provision is not likely seriously to affect the Canadian market. The higher grades of coal oil, such as "Palacine," are practically the only lines to be affected. Compared with amount of other grades of coal oil used there are very small quantities of this class of oil in use. The particular grade noted is refined from Pennsylvania crude. The market for gasoline is holding steady. Mid-continent crude oil has not yet registered an advance, and there is now an accumulation of stock of gasoline on this continent due to lack of tonnage to carry commodity overseas. Gasoline is quoted at [illegible] gallon.

### Metals

The outstanding feature of the week in the non-ferrous metal market has been a sharp advance in tin, due to the acute shortage and great difficulty that is being experienced in obtaining supplies of this metal. There is no change in the copper situation at present, although it is not unlikely that the price will be advanced in the States in line with rising producing costs. Spelter is firmer and a shade higher and solders have also advanced due to the high cost of tin. There is nothing of particular interest to note in regard to the other metals, and prices are unchanged. Business locally continues steady and in good volume.

**Copper.**—The growing demand for copper for Government work indicates a diminished supply for other consumers, although it is believed that there will be sufficient supplies to meet all requirements. It is now more generally believed that the United States Government will allow 25c as the new fixed price for copper when the present agreement expires on June 1. It is estimated that the advance of 1½c will cover the increased production costs. The producers have been agitating for a 25c price for some time. The local situation is unchanged, lake and electrolytic being quoted at 29c and casting at 28c per pound.

**Tin.**—The tin situation is getting more acute and as a result of the great scarcity prices are steadily advanced. The small quantities of tin that are coming in are snapped up, principally for Government work, and many consumers cannot yet buy metal at all. Tin is allowed to come to consignees in Canada from England, but a permit must first be obtained from Ottawa in order to control the ultimate destination of all shipments. Tin has advanced 15c, and is now quoted nominally at $1 per pound.

**Spelter.**—Prices are a shade higher locally, but the market is dull and featureless. The consuming demand is light and considerably below the producing capacity. Local price is now 10c per pound.

**Lead.**—The market continues firm, with a higher tendency. There is some scarcity of lead in the primary market, which has placed the metal in a strong position, and an advance is not unlikely. The trust price is 7.25c New York for spot lead. Local price, 9c per pound.

**Antimony.**—The market continues quiet, with a lower tendency. Available supplies are sufficient to meet the demand. Local price, 17c per pound.

**Aluminum.**—The market is firmer on account of heavier demand, but quotations are unchanged in the meantime at 52c per pound. The price of aluminum in the States has been fixed at 32c per pound.

**Solders.**—Due to strong market for tin there has been a continued strong market for solder, and prices have advanced. Guaranteed is now quoted at a range of 47c to 48c per pound; strictly at 44c to 45c. Demand for solder is reported active, buying evidently being stimulated by the upward trend of prices.

## Sydney

SYDNEY, N.S., March 1.—A settlement of the wage question has been arrived at between the Amalgamated Mine Workers of Nova Scotia and the Dominion Coal Company. An increase of ten cents per day is given to all workmen rated under $3 per day, plus an increase of 15 per cent. This increases the minimum rate for common labor from the former figure of $2.43 per day to $2.91. The attention that has been paid to increasing the wages of the lower-paid men is evident when it is remembered that the common labor rate ten years ago was $1.38 per day. An increase of 12½ per cent. is given to all other day-paid labor and to all contract labor. The bonus given for steady work, which is specified to consist in working 22 days out of each consecutive period of 24 days, is increased from five per cent. to ten per cent. upon the net earnings of all men who produce or handle coal. The A. M. W. endeavored to have the steady work bonus extended to all classes of labor at the collieries, but this the company would not agree to, as the bonus was intended to stimulate production, and was, therefore, limited in its application to the producing class of workmen. The wage rates are subject to a further adjustment should a revision of the costs of living at 1st July next show necessity to still further adjust the curve of wages to that of living costs.

The negotiations on the wage question have been in progress since last November, but under an arrangement made before the close of 1917 the increase in wages now agreed upon is retroactive to 1st January, 1918, so that the workmen will receive the sum of the increase, as it affects the earnings of January and February, in one lump sum.

### To Increase Output

The Fuel Controller met the representatives of the Nova Scotia Steel & Coal Co. and the Dominion Coal Company and the Executive of the A.M.W. of Nova Scotia in Halifax to discuss the possibility of increased production of coal. Both parties expressed their earnest desire to do everything possible under the present serious conditions of coal shortage to increase the output of coal. Co-operation in every possible way was promised between the companies and the workmen, and while the improvement in output is not likely to be as great as has been stated in newspaper reports, a decided stimulus has been given, the results of which are already to be noted. The A.M.W. are also undertaking to work in conjunction with the companies in an endeavor to obtain workmen from Newfoundland. It is to be hoped that this praiseworthy endeavor will at least arrest the continuous decline in production which has been apparent since the summer of 1915. The pressing necessity for some definite action to stimulate coal production will be seen from the fact that the Dominion Coal Company's production for the first two months of 1918 totalled 351,000 tons compared with 417,000 tons in 1917, showing a decline of 66,000 tons.

The coroner's enquiry into the Allan shaft explosion has not yet been concluded, but expert evidence given so far seems to bear out the first theories of the probable cause, namely, that the explosion is attributable to a "blown-out shot." Pressure is brought upon the provincial authorities to institute a further enquiry by a technical or departmental commission. The mine is still idle.

## New York

NEW YORK, March 2.—Great activity is evident in the machinery industry throughout the country. Buying at Washington is in full swing. Several important orders have been placed and large contracts are pending. Most of the large machinery manufacturers have representatives located at the capital to facilitate the consummation of contracts with the Government. The Bureau of Steam Engineering, Navy Department, is buying tools for naval repair ships. The General Engineering Depot is buying equipment for repair shops in France. Several additional contracts for high explosive shells and guns also have been placed which will call for the purchase of additional shop equipment. The Regal Car Co., Detroit, will manufacture 300,000 three-inch shells at its Jamestown, New York, plant. At the behest of the Government steps are being taken for the building of two shell loading plants in this territory. The work is to be undertaken by the T. A. Gillespie Co. and the Atlantic Loading Co. These plants will call for machine tools and conveying machinery in the near future.

The Worthington Pump & Machinery Corporation has decided to utilize its Harrison, N.J., works instead of the Holyoke plant for the manufacture of pumps for submarine destroyers. This change will necessitate the purchase of less equipment. The Liberty Ordnance Co., Bridgeport, Conn., is buying a small list of tools. The Thompson-Starrett Co., New York, which is building a powder plant for the Government at Charlestown, West Virginia, is buying pipe, fittings and conveying machinery, the latter including 49 hand power cranes and 21 hoists. The Air Nitrates Co., which is a branch of the Ordnance Department of the U.S. Army, continues to buy tools and cranes for the nitrate plant at Mussel Shoals, Ala. The Department also contemplates the duplication of this plant at another point in the South.

### Shipbuilding Equipment Demand

Ship builders continue actively in the market for machinery of various kinds. The Federal Shipbuilding Co. has placed an order with a local house for repair shop equipment for each of the ten ships it is now building for the Government. The Virginia Shipbuilding Co. has closed for two cranes and the Sun Shipbuilding Co. has bought two electric cranes from the Toledo Bridge & Crane Co. The Lone Star Shipbuilding Co. is in the market for a locomotive crane for its shipyard. The Submarine Boat Corporation is utilizing the shops of the Lackawana Bridge Co. in which it will install a fitting out crane.

Orders for a large number of tools for portable machine shops to be used in field service in France are being placed by the Engineering Depot. Automobile trucks are being fitted with repairing equipment, including a small power plant, a welding outfit and tools.

### Foreign Arsenal Contract

The Allied Machinery Co., New York, has been given a commission by the Brazilian mission for the purchase of tools and other equipment for an arsenal to be built at Rio de Janeiro for the Brazilian Government. The Pennsylvania R.R. is again expected in the market for the purchase of tools and other equipment for locomotive, car and repair shops. The United Verde Copper Co., Clarksdale, Arizona, is buying 50 machine tools for a blacksmith and repair shops at the copper mines.

There is great activity throughout New England. Many private plants holding Government orders are placing contracts which require the buying of many small tools of almost every type and kind and the prospect is that this sort of buying will continue actively throughout the month. The Connecticut Brass & Manufacturing Co. is buying equipment for plant extension. The Aeronautical Engine Co., Long Island City, a Government plant, has been given an order for Gnome motors which will keep the plant busy temporarily while preparations are being made for the building of a large number of airplane engines. At least this is the interpretation placed upon recent Government action. In the Central West large buying has continued by the Standard Steel Car Co. The Glenn L. Martin Co., Cleveland, is preparing specifications for tools to build airplanes.

## Washington

WASHINGTON, March 2.—Despite pessimistic opinions which are being expressed daily in the United States regarding the possibility of an output of a large ship tonnage during the year 1918, officials of the companies building the ships maintain that they will keep their contracts.

Interest has centered on the Hog Island shipyard, operated by the American International Corporation. This yard, which is planned as the greatest shipyard ever attempted with fifty large shipways, has been under the fire of criticism for the past few weeks and it has been classed as an absolute failure by many. Officials of the company have now come to the front, however, and declare that despite all pessimistic predictions they will fill their contracts.

### Ship Production Prospects

Twenty-five ships will be delivered from Hog Island on November 1, twenty-five ships will be delivered by December 15, and one hundred and twenty additional ships will be delivered in the first six months of 1919, according to Harris H. D. Connick, a vice president of the American International Corporation. Connick stoutly maintains that the Hog Island project will go through and that by the middle of 1919 there will be large ships produced from that plant in large quantities on short time. The labor situation which has appeared to be critical has quietened down and shipbuilders are reporting that more favorable labor supplies are available. With the Hog Island project on the apparent road to success the outlook for a great shipping program from the United States is better to-day than it has been for weeks. Other shipyards are finding little trouble in keeping to their schedules and the first wave of pessimism and the first crisis seems to be safely past.

The lumber industry in the United States is headed straight for government control. Bills have been introduced in the Senate giving the President of the United States the power to commandeer all standing timber and to order specifications for its cutting. This gives the President the virtual control of all the lumber industry. This act has been caused by the alarming shortage of spruce for aeroplane manufacture and a threatening shortage of other timber for wooden ships. It is believed that with the lumber industry under government control, the output of lumber in the United States can meet not only the needs of this country but also those of the Allies.

In order to insure the future of the American merchant marine the War Trade Board has taken steps to make certain that all vessels now building in the United States will fly the American flag. Orders have been issued governing the licensing of bunker coal supplies which will prohibit the supplying of any bunker coal to any new vessels building in the United States unless they are registered under the American flag.

### Coal Prices to be Revised

A general revision of coal prices in the United States by April 1 is now confidently expected. The revisions will be for the most part downward revisions and will have a similar effect on Canada in so far as the Canadian coal supply is affected by the American supply. The Fuel Administration is now undertaking the first wide sweeping attempt at a cost census. It is expected that by April 1 the Fuel Administration will have figures showing the cost of production in every coal mine in the United States. Prices will be revised according to the figures shown in the cost estimate now under way.

A general reorganization of the plan of war production in the United States is expected at date of writing. President Wilson has failed to appoint a successor to Daniel Willard as chairman of the War Industries Board and it is understood that this is due to the fact that he plans a general reorganization which will place the entire powers of control of purchases, production and al-

ant work.

To Develop U. S. Minerals

Secretary of the Interior Lane is putting forward a plan which he declares will [illegible] for the United States. He plans to increase the production of minerals in the United States and thereby save the tonnage used in their importation. At the present time the United States is importing 2,000,000 tons of minerals annually. It is said that the Secretary of the Interior to attempt to curtail the importation of minerals from Canada because of the fact that little or no available ocean tonnage is used for the importation of these minerals and also due to the fact that because of the similarity of conditions in the two countries the cost of production in the United States could not go below that of Canada, since the mineral deposits in the United States would have to be developed and those in Canada are already highly developed.

The bituminous coal production in the United States has now reached a normal state. Latest reports show a weekly production of 1,847,000 tons as compared with a weekly production for the same period last year of 1,753,000 tons.

The general licensing of all imports into the United States went into effect on March 4. Canadian imports are exempted under a blanket license, with the exception of some articles which have been placed under a special ban. These constitute for the most part non-essential materials and things which are not necessary to the conduct of the war.

Building operations in the United States are under the ban unless they are necessary to the war. Secretary of the Treasury McAdoo has issued a statement in which he has officially called upon the business of the country to stop all building operations for the period of the war unless found necessary for the conduct of the war.

## Pittsburg

PITTSBURGH, Pa., March 2. — The United States Railroad Administration's plans for buying locomotives and cars appear to have been put in definite shape, and the steel industry rather expects definite announcements to be made within a fortnight of the placing of orders. The maximum contemplated has been 4,000 locomotives and 250,000 freight cars, but current estimates are that orders placed at this time will be for about 2,000 locomotives and 100,000 to 150,000 freight cars. The steel makers profess positive belief that they will be able to furnish the requisite steel as rapidly as it will be needed. The limitation of the speed of building will rather be the shop capacity that can be made available. The locomotive shops are, of course, fairly busy already with Government and export orders, and they have a great deal of munition work besides, while the car shops in many instances are also working on war orders. Some help to rapid building is expected to be furnished by carrying standardization to the last degree. The railroads are believed to have been over punctilious in the past, particularly in specifying types of locomotives. The congestion of the past few months, when many yards would have been glad to get passenger locomotives and many fancy passenger trains would have been better off for the aid of a couple of switching engines, has given a somewhat new viewpoint.

Prospective Steel Prices

No information of particular value was given out after yesterday's meeting of the steel committees of the American Iron and Steel Institute in New York. A dozen or more representatives of producing concerns met with the committees, being especially invited to give their advice. The purpose of the meeting was to map out a program against the meeting it is expected the War Industries Board will call in the near future, to consider prices. The present set prices were, by the President's announcement of Dec. 28, extended to March 31. It should be noted that last December there were strong prospects that the Pomerene iron and steel price-fixing bill, or some similar measure, would be passed by Congress, perhaps by the end of January. No such legislation is now seriously contemplated, either because Congress has been kept too busy with other matters or because the regulation of prices by agreement between the Government and the producers has worked so satisfactorily. The regulation has certainly been a success, for with inconsequential exceptions the producers have been scrupulous to follow to the limit the letter and spirit of all regulations that have been promulgated. The War Trade Board would, of course, be disposed to seek lower prices if such a revision could be compassed, while for strategic reasons the manufacturers would naturally enter the coming conference with a plea for higher prices. Undoubtedly the real debate will be as to the period of time for which the present prices shall be extended. As changes that might be made in future would be downward rather than upward the producers will contend for the reaffirmation of prices for a long period, or to the end of the present year, using the contention that extending prices for a short period at a time tends to lessen the stability of the market.

The authorities at Washington are presumably too well posted to give much heed to the contention sometimes made, chiefly in the newspapers, perhaps, that certain smaller manufacturers require higher prices. Frequently the contention takes the form that plate mills that must buy their slabs cannot get them at the present set price of $50, or cannot convert them into plates at a profit at the set price for plates of 3.25c. So far as stimulating production is concerned there is nothing in the argument, for there is more plate capacity in the country than slab capacity. The largest producer of all, the Carnegie Steel Company, has not been able to operate its new Liberty plate mill fully because it could not produce enough slabs.

What Curtails Production?

At this time there is some danger involved in accepting the universally given explanation of the light rate of production of finished steel, that explanation being that production is limited by the ability of the railroads to accept shipments of finished steel, the production being correspondingly limited because mill warehouses and yards are already filled and the mills, therefore, are in position to produce only the material that they can ship. Undoubtedly this situation obtained in January. Previously the limitation in production had been the insufficient supply of pig iron, the production of pig iron having been restricted because the railroads were not moving enough coke and coking coal. It is a question, however, whether the situation to-day is the same as it was in January, whether the traffic situation is wholly responsible for the reduced output of finished steel.

New Embargo Rules

There are numerous railroad embargoes, and to ship into or through an embargo a railroad permit is necessary. Formerly the railroad rule was that the permit could be sought by either the shipper or consignee. By a new order, early in February, it is required that the consignee, and not the shipper, apply for the permit. There are no data available as to the proportion of permit applications that are granted, but it is a fact that they are granted with considerable freedom. It will readily be seen that if consignees do not apply for permits they are not granted, and if the total tonnage for which permits are available is small, a semblance of justice can be maintained by claiming the trouble is with the railroads, whereas a considerable part of it may be due to the consignees failing to apply for permits because they do not want the material. The bald fact is that it is a question whether the present light output of finished steel, now about 65 per cent. of capacity against an average of about 55 per cent. in the first five weeks of the year, is due altogether to insufficiency of transportation or in part to insufficiency of demand.

While very little is openly said about the lightness of commercial demand for steel, apart from all war requirements, it is a fact that some of the leading producers have very serious doubts whether there is going to be enough demand to keep them operating at the rate that will be permitted by traffic conditions, which are constantly improving. There is a distinct possibility that in the near future competitive conditions will develop such as to make open market prices lower than the set prices. This would occur first, of course, in the finished steel products that are required in smallest volume for war purposes. By common consent plates are regarded as the greatest war essential, in proportion to supplies available, and yet there is the interesting fact that while

### PITTSBURG MARKETS

[illegible] for the Government, its Allies and the domestic [illegible] has recently been bid on plates for export, a class of trade to which the set [illegible] If [illegible] thing occurs in plates, something still more striking may occur in merchant bars, in which the productive capacity is over 5,000,000 tons a year, while the war demand is relatively light.

There is a heavy demand for oil country goods, while demand for small sizes of pipe is light. There is a moderate demand for sheets, not all of it satisfied, but owing to limited supplies of steel the sheet mills are operating at only about 40 per cent. of capacity.

### PULP AND PAPER EXPORTS

R. A. PRINGLE, K.C., Canada's paper controller, recently addressed the Canadian Forestry Association on "Some Aspects of Canada's Forestry Problem." He said that during the year ending March 31, 1917, the exports of pulp and paper from this country totalled $40,000,000. He called attention to the fact that Canada was supplying one-third of the newsprint used in the United States, partly in the finished product and partly in the raw material, and the requirements of the United States in pulpwood were 600,000 tons a day. Pulpwood has increased in value, he said, and brought from $2 to $7 a cord on the stump.

"A point of extreme interest," he said, "is the fact that the quantity of pulpwood manufactured in Canada is steady gaining on the amount exported unmanufactured. The figures for 1916 show more than 1,700,000 cords to have been manufactured in Canada, while 1,000,000 cords were exported in the raw state. If the latter amount were manufactured in Canada it would have a market value of $40,000,000."

Canada stood third among the countries of the world with regard to forest possessions, he asserted, Russia and the United States having greater forest resources.

### FREIGHT TO GO SHORTEST WAY

SWEEPING changes in freight arrange[illegible] of the railways in Ontario will go into effect as a result of a special report ordered by the Canadian Railway War Board, and due to be presented at an early meeting of the special committee. These will remove the last vestiges of indirect routing in the only part of Canada where this condition exists. Experts are completing the new routings for freight travelling between points in Ontario. A car will then move by the shortest route, irrespective of what lines it covers. It will mean the cancellation of certain tariffs. Traffic men of all lines are watching closely to see the results [illegible] there is a great chance for the board having the work in hand to do a work that will ac-

# Enlarged Canadian Trade Intelligence Service

**Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.**

CHILE—Valparaiso, British Consul General.

COLOMBIA—Bogota, British Consul, General.

ECUADOR—Quito, British Consul General. Guayquil, British Consul.

EGYPT—Alexandria, British Consul General.

FRANCE—Havre, British Consul General. Marseilles, British Consul General..

INDIA—Calcutta, Director-General of Commercial Intelligence.

ITALY—Genoa, British Consul General. Milan, British Consul.

MEXICO—Mexico, British Consul General.

NETHERLANDS—Amsterdam, British Consul.

PANAMA—Colon, British Consul. Panama, British Vice-Consul.

PERU—Lima, British Vice-Consul.

PORTUGAL—Lisbon, British Consul.

RUSSIA—Moscow, British Consul General. Petrograd, British Consul. Vladivostock, British Consul. Odessa, British Consul General.

SPAIN—Barcelona, British Consul General. Madrid, British Consul.

SWEDEN—Stockholm, British Consul.

SWITZERLAND—Geneva, British Consul.

URUGUAY—Monte Video, British Vice-Consul.

VENEZUELA—Caracas, British Vice-Consul.

BRAZIL—Bahia, British Consul. Rio de Janeira, British Consul General.

# Canadian Commercial Intelligence Service

**The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.**

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## ENGINEERING

**Hamilton, Ont.**—The Imperial Oil Co. contemplate erecting a boiler and pump [illegible] Head office, Church street, Toronto.

**Amherstburg, Ont.** The Brunner, Mond Co. propose the construction of a water works pump house and intake pipe in the Detroit River.

**Port Colborne, Ont.**—The Canadian Furnace Co. had their second ore bridge blown down in the storm last week, the damage being estimated at $100,000. The other ore bridge was blown down last year, and is now being rebuilt.

**Brantford, Ont.**—The Dominion Steel Products Co., will shortly commence operations in their new plant. One building 90 feet by 225 feet is completed and another building 100 feet by 300 feet is nearly finished. The company has on hand some large war contracts from the United States.

**Toronto, Ont.**—H. C. Anderson and C. G. Sheldon, representing the Northern Coal Operators' Association, have arrived in the city to impress upon the people of Ontario that the lignite coal mined in Alberta can be brought into this province in case of emergency. They have come here to arrange, if possible, an Eastern movement from the Western mines. Shipments by rail, Mr. Anderson claims, would be the rule, and the freight charges would be about $5 per ton.

**Fort William, Ont.**—The Canadian Car & Foundry Co. has awarded the contract for the buildings at the new shipbuilding plant at Fort William to the Dominion Bridge Co. The Bridge Co. must, under the contract, finish the building in six weeks. This is an indication that the actual shipbuilding operations will be commenced as soon as possible. The contract was for twelve mine sweepers 143 feet long by 22 feet beam, the price being given as $2,500,000. The company is now turning out 25 box cars a day at the Fort William car works.

**Victoria, B.C.** — British Columbia's campaign for the establishment of steel mills and government assistance in developing her vast iron reserves secured more momentum when a mass meeting, addressed by representatives from the island and mainland, was held here recently. Resolutions were passed calling for co-operation between the provincial and federal governments, and for giving the provincial minister of mines additional power in expropriating mine property in British Columbia, and also urging the British Columbia Government to appoint independent experts to make an investigation and report on the situation.

**Quebec, Que.**—With the exception of the closing of some temporary sluices, the great dam at the head of the St. [illegible] this province the largest artificial water storage in the world. The reservoir has an area of not less than 300 square miles. It is the completion of a work which has involved more than five years of investigation and construction, and an expenditure not far short of $3,000,000. On July 25, 1915, the contract was finally awarded to the St. Maurice Construction Co., who made an arrangement under which the supervision and organization of the contract work was placed in the hands of Messrs. Fraser, Brace & Co. of Montreal.

## ELECTRICAL

**Kingston, Ont.**—The Utilities' Commission has decided to buy four 40 k.w. transformers for the hosiery mill, and a meter for the Campbell power line. A transformer for the street railway will also be purchased from the Canadian General Electric Co., in place of one ordered but not delivered from a firm in the States.

**Vancouver, B.C.**—The C.P.R. is not going to undertake any construction this year, according to Grant Hall, vice-president and general manager of the railway, who is in Vancouver to-day, but he said the company intended spending between $6,000,000 and $7,000,000 in maintenance and betterment.

## BUILDING

**Toronto, Ont.**—Fire at the Hunter-Rose Building at 12 Sheppard street, did damage estimated by the Fire Deparment at $15,000 ($10,000 to the contents and $5,000 to the building). The loss is covered by insurance.

## MUNICIPAL

**Toronto, Ont.**—The Board of Control has placed $50,000 on the estimates for new water meters.

**North Bay, Ont.**—The town council has decided to purchase a steam pump for the waterworks department.

**Three Rivers, Que.**—The city council is in the market for a centrifugal pump of 3,000 gallons capacity and a 200 h.p. oil engine.

**Kingston, Ont.**—Beginning the 1st of March, the price of gas will be $1.50 a thousand cubic feet, an increase of twenty-five per cent. on the present rate of $1.20, and of fifty per cent. on the rate of one dollar which was charged one year ago. The Utilities Commission at its meeting recently decided that an increase was absolutely necessary.

**Kingston, Ont.**—Manager Folger, of the Utilities' Commission, will report at the next meeting as to the cost of rearranging the smoke stack and some other machinery which was in use when the electric generators were driven by steam, which it is proposed to change over to the gas plant now. It was expected that the work would cost about $1,000 and it was thought better to get a closer estimate of the cost.

**Victoria, B.C.**—Public works expenditures in the province for the fiscal year 1918-1919 will be little short of two million dollars if the Legislature accepts the estimates which the Public Works Department has prepared. It is said that the proposed works expenditure for the next fiscal year marks an increase of from ten to fifteen per cent. over the amount spent on public works for the year which will close on March 31 next. The estimates for the year now coming to an end show a total of $1,800,600 for public works, and it can therefore be assumed that the estimates for the approaching fiscal year will be at the round two-billion mark.

## CONTRACTS

**Bassano, Alta.**—The Canadian Allis-Chalmers, Ltd., have been awarded the contract for a pump and 75 h.p. motor for the town council.

**Brantford, Ont.**—The Canadian Westinghouse Co., Hamilton, has secured the contract for motor and electrical equipment for the sewage pumping station here.

**Lethbridge, Alta.**—The Canadian General Electric Co., of Toronto, has been awarded the contract for the new 1,200 kilowatt turbo-generator for the civic power house.

## PERSONAL

**Bernard Baruch** has been named chairman of the United States War Industries' Board, succeeding Daniel Willard, resigned.

**Edward C. Fry**, for more than half a century Lloyd's agent at Quebec, died recently after a brief illness. He was born at Bristol, England, and was recognized as one of the best informed shipping men in that city.

**Reginald Beaumont** has been appointed assistant manager of the G. T. P. Steamship Lines, with headquarters at Prince Rupert, B.C. Mr. Beaumont has been assistant to the manager at Prince Rupert for the past eight years.

**John G. Kent** has been appointed permanent managing director of the Canadian National Exhibition. Mr. Kent has acted for many years as member of the board of directors, as president, and as honorary manager. He is president of the Toronto Board of Trade.

**J. J. Scullan**, formerly general superintendent of the Davenport Works of Canadian Allis-Chalmers, Ltd., Toronto, and latterly manager of that firm's shipyard at Bridgeburg, Ont., has been ap-

# Canadians Must Be Told Truth About The War

## Dr. Dillon Discovers a New Danger in an Old Shape "Ritzonian" a Menace to Victory.

S truth about the war that they sacrificing our sons, husbands, fathers and resources—piling up taxes blindly—kept in darkness because of a few weak-minded, excitable editors, who see things through dark spectacles, or because old party hacks in Cabinet jobs fail to recognize their own incapacity; or because some big profiteers wish things to continue as they are?

FINANCIAL vital importance to Canadian business, authorities are with THE POST in its

**POST Readers NOT "Ritzonian"**

In this special article appears Dr. Dillon's definition of a "Ritzonian"—the type of man who is "muddling through" the war —"one who loves indolence and luxury, loathes system, shuns effort, feels an insolent contempt for merit and labor, and fancies himself fitted to undertake a task of any magnitude." Here you have a type which is the very opposite to the type of readers of THE FINANCIAL POST.

**A Real Business Newspaper**

Accurate, readable, concise, complete, THE FINANCIAL POST is pre-eminently the business newspaper for alert men of affairs with Canadian interests. From this brief list you will get a fair idea of the range of business news contained in this week's issue of THE FINANCIAL POST.

Outlook for Continuation of Shell-Making
The Exchange Situation is Brightening
Chinese for Canadian
Railway Halves its Dividend
Effect of Victory Loan on Bank Statement
Precarious Future of Street Railways
Bond Market Still Absorbs Large Issues
No Tax Relief for Halifax Sufferers
Improvement in Position of Steamships
Steel Merger on Par Basis With Boats Out
War Business Not to Prevent Other Business
Halifax Power Co. Has Changed Plans
Must Meet Cost of War by Daily Savings
Encouraging Showing by British Trade

While these headings by no means cover the entire contents of this week's FINANCIAL POST, they will indicate to you the wide field thoroughly covered by this outstandingly good business newspaper. To gain a more intimate knowledge of the value of THE FINANCIAL POST to you in your business send for a sample copy, or if you prefer to make a still more extended test, order a subscription. The little coupon below will help you. You have only to sign and send it.

The MacLean Publishing Co.,
153 University Ave., Toronto.

Send me THE FINANCIAL POST each week till further ordered. I will send subscription price ($3.00 per year) on receipt of bill, or you may draw on me

pointed manager of hull construction for the Marine Boat Corporation of New York.

**James Lynn Rodgers**, recently appointed Consul General in Canada for the United States, has taken up his duties at Montreal, replacing Vice-Consul Bradley, who retired some weeks ago. Mr. Rodgers was consul-general at Havana. He is a native of Columbus, Ohio, and entered the U. S. service in 1915, as consul-general at Shanghai.

# TRADE GOSSIP

**Marsh & Henthorn Ltd.**, of Belleville, Ont., announce that the title of the concern has been changed to the Marsh Engineering Works Ltd.

**Platinum Commandeered in the U. S.** —Orders have been issued for the commandeering for war purposes of all crude and unworked platinum in the hands of importers, jobbers and wholesalers.

**Montreal, Que.**—In order to obtain more factory space for their increasing activities, the Mason Regulator and Engineering Co. of Montreal are vacating their present factory for more commodious quarters at 135-153 Dagenais Street. The head office of the company will still be maintained at 380 St. James Street.

**Mining, Metallurgical and Chemical Supplies.**—A London (England) firm of engineers and contractors, manufacturing designing and engineering plants and supplying machinery and materials of every description, desires to correspond with Canadian companies to whom its services may be of interest. (Address, British Trade Commissioner in Canada, 363 Beaver Hall Square, Montreal, referring to British Trade Inquiry No. 2934.)

**Customs Receipts Show Big Increase.** —An increase of $15,382,197 in customs receipts for the 11 months of the fiscal year ending Feb. 28, as compared with the same period last year, is shown by the monthly statement of the Customs' Department issued at Ottawa recently. Customs receipts for the 11 months of the present year were $146,122,186, while last year they amounted to $130,739,989. Receipts for the present month were $9,559,480.

**Locomotive Building Steel Requirements.**—Locomotive builders in Canada and the United States will require about 76,000 tons of forged rolled and cast steel for the building of 383 locomotives, orders for which have been taken since the first of the year. The largest contracts have been placed with the American Locomotive Co., while the Montreal Locomotive Works and the Canadian Locomotive Co. have also secured important contracts.

**Browning Gun Adopted for U. S. Army.** —Without a single malfunction, the Browning automatic machine guns, light and heavy, which have been adopted for use by the American army, were publicly demonstrated and tested by the Ordnance Department of the U. S. army on Feb. 27, on the Government rifle range at Congress Heights, several miles southeast of Washington. They have been finally approved and adopted as the official light and heavyweight machine guns for the United States army.

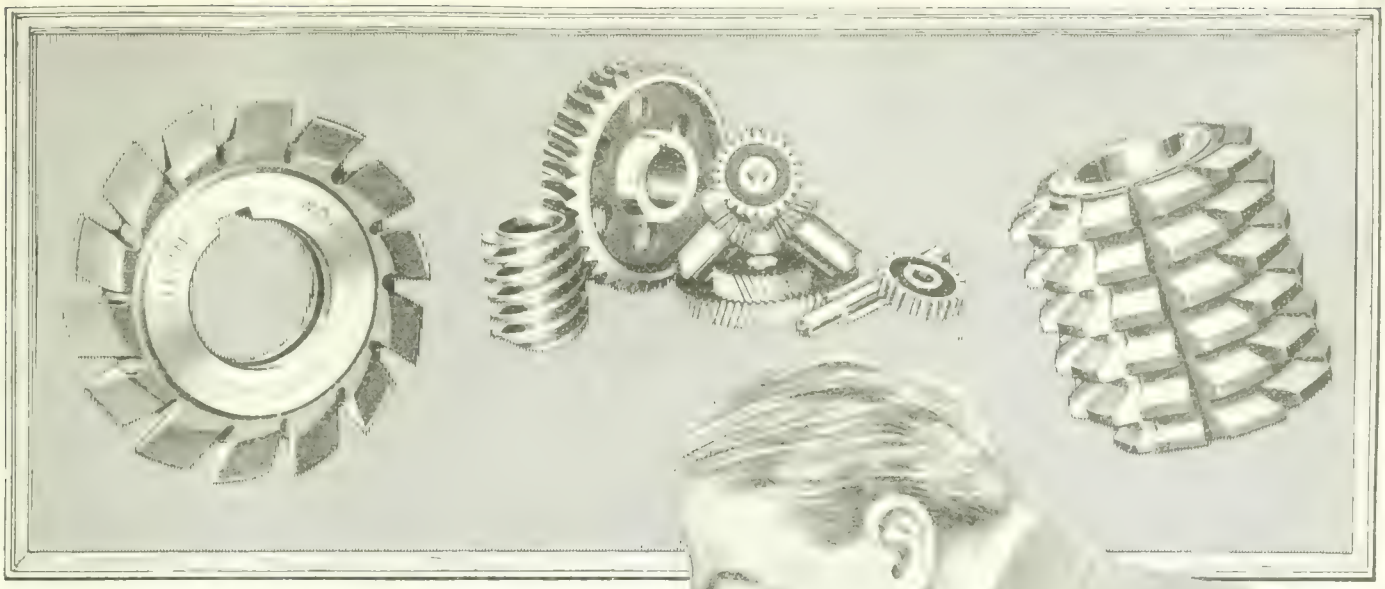
**Mining Institute Will Meet in Montreal.** Keen interest is being shown by mining men and metallurgists in the coming meeting of the Canadian Mining Institute to be held in Montreal on March 6, 7 and 8 next. Special significance is attached to the meeting due to the number of problems of national importance that have been introduced for discussion. Among others affecting this district will be a paper on the groch system of flotation, and a paper by Alfred Whitman, entitled, "Restudy of the Cobalt area."

**Large Freight Car Orders in the U.S.** —The prospective Government orders for between 100,000 and 150,000 freight cars will be the largest contract ever placed in the history of the equipment business in the United States. Even at the estimated average cost of $3,500 per car, something like $350,000,000 would be involved in an order for 100,000 cars, and it is understood that there are also under consideration orders for something like 2,000 locomotives to be placed when the car contracts are out of the way.

**Hydro Commission Gets Extra Power.** —The Ontario Hydro-Electric Commission has secured from the Canadian Niagara Power Co. 20,000 horse-power which they have been deprived of for a month or two as a result of the breaking down of two generators at the Canadian Niagara plant. When the machines went out of commission the Hydro asked the Canadian Niagara Co. to supply the power by cutting down on exportations to Buffalo. The company refused, and the Hydro, in spite of appeals to the Power Controller, was unable to get its way.

**Peter Lyall Construction Co. Busy.**— A statement recently issued by the Peter Lyall Construction Co., of Montreal, states that the company's plants have been working practically to capacity throughout the year, and orders on the books are said to be sufficiently large to keep the plants busy for many months to come. At the present time work is going ahead on contracts for the American Government, and shipments will go forward before a great length of time. No particular activity is reported in the construction department, but the company is steadily working on the Parliament Buildings at Ottawa, as well as on the terminals in that city.

**Canada Copper Corporation Developments.**—The Canada Copper Corporation is reported to be speeding the advance of the tunnel which is to become the avenue of development as well as for removal of copper-bearing ore. General Manager Lachmund stated that the tunnel will tap the ore at a depth of 1,000 feet below the highest outcrop. Operations were started on Oct. 10, 1917. The total length of the tunnel on Jan. 31 last was 2,067 feet, and the total length timbered was 200 feet. The dimensions of the tunnel are 9 by 11 feet. The aver-



# A Helpful, Technical Service for Gear Makers

THIS Company maintains a completely equipped department for the designing and execution of SPECIAL hobs and cutters: a broad, constructive work which our engineers have been developing since the founding of this business. It has become an important, permanent feature of our service, now at the disposal of all who are confronted with perplexing tool problems, especially hobbing.

We would welcome the opportunity to demonstrate how you could use this service to advantage, and cordially invite you to confer with our Engineering Department in person or by letter.

**Plan Big Outlay on Hydro System.**—Estimated expenditures of over $9,000,000 for Hydro Electric extensions, of which $4,175,000 is to pay for work on the Chippawa Creek development, are included in the Ontario Provincial estimates totalling $9,741,662. For Niagara system extension the sum of $2,865,000 is being voted, for the Central Ontario system extensions $588,000, for the Severn system $105,000, Eugenia Falls system $233,000, Port Arthur system $150,000, St. Lawrence system $251,000, Rideau system $117,000, Nipissing system $60,000, and for service buildings and miscellaneous, the sum of $100,000 is asked.

**Vancouver, B.C.**—This city's first bulk shipment of grain has arrived safely at a British port, according to word received here. A steamer which was loaded at the Government elevator here in November with 100,000 bushels of wheat from the prairies, made the journey safely to the United Kingdom via the Panama Canal, and now word is awaited anxiously as to the condition in which the grain in this test shipment reached its destination. The shipment was accompanied by A. W. Alcock, of Winnipeg, grain expert, and assistant chemist of the Canadian Board of Grain Commissioners, who is to observe the condition of the grain at all stages of the voyage.

**Canadian Locomotive Co. Secures Government Contract.**—President H. J. Harty of the Canadian Locomotive announced recently that the company had closed a contract with the Department of Railways and Canals at Ottawa to build ten new locomotives to be used on the Canadian Government railways. Of the ten engines, six are to be six-wheeled switchers, the engine and tender to weigh when in working order about 251,000 pounds, and four are to be ten-wheeled narrow gauge ones, the engine and tender to weigh when in working order about 162,900 pounds. The latter four engines are to be used on the Prince Edward Island railways. The ten engines are to be completed for delivery in June.

**Conference on International Standards.**—The arrival in England of delegates from Allied nations for a conference on international standards was announced recently by the Aircraft Board at Washington. The conference will undertake, it is said, a standardization of manufacturing materials as related to the production of machinery, motors, aircraft, etc. The American delegation is headed by F. G. Diffen, of the Aircraft Board, and included members from all the prominent engineering societies of the country, of the Aircraft Board, the advisory committee for aeronautics, the signal corps, the navy and the original international aircraft standards board, of which the conference is said to be an outgrowth.

**Will Start Building Government Ships.**—The Canadian Vickers Co., which has commenced work on the first steel steamer of 4,350 tons burden, is to lay down a second of 8,200 tons and it is expected a contract for a third ship of 9,500 tons will soon be made with the Collingwood Shipbuilding Co. The Government's shipbuilding programme contemplates the laying down of the keels of some forty ships to June, 1919. Of this number, four of 5,000 tons and 6 of 8,200 tons are to be built on the Pacific coast. Arrangements have been made whereby the Government is assured of a supply of ship plates and steel materials for its programme. Orders for steel for the Canadian Government would, it is understood, be placed by the United States Purchasing Commission with various American steel companies.

**Traction Engines and Parts Admitted Duty Free.**—By order-in-council, under the War Measures' Act, now in effect, it is provided that:—"During the period of one year from Feb. 7, 1918, remission and refund of duty is hereby authorized in respect of traction engines costing not more than one thousand four hundred dollars in the country of production, designed to be moved by steam or other motive power for farm purposes, and parts thereof for repair; and traction attachments designed and imported to be combined with automobiles in Canada for use as traction engines for farm purposes and parts thereof for repair." In order to expedite importation and delivery of the above articles, they must be entered at the custom house as free of ordinary duty and war tax, on the usual form of entry for home consumption (B-1) until Feb. 8, 1919. The articles should be set forth in the entry in the words by which they are above described.

## TENDERS

**Chatham, Ont.**—The city council contemplate undertaking extensive improvements to the waterworks system.

**Fredericton, N.B.**—The city council are considering calling for tenders for pumps for the waterworks.

**Verdun, Que.**—Tenders will be called this year for repairs and reinforcements to waterworks and electric plants at a cost of $50,000 for the town council.

**Melbourne, Australia.**—Tenders for the following may be addressed to the Director of Navy Contracts, Navy Office, Melbourne: Supply, delivery and erection at Garden Island, of one (1) 200 horse-power prime mover set of either semi-Diesel type or other heavy oil engine direct coupled to 2-65 K.W. 240 volt D.C. electric generating set. All accessories, tank and fittings to be supplied by tenders as per specification. Date of closing, June 7, 1918. Tender forms are open for inspection at the Department of Trade and Commerce, Ottawa. File No. 20117.

**Ottawa, Ont.**—Tenders will be received until March 25, 1918, for the switchboards, panel boards and transformers required in the reconstruction of the Parliament Buildings. All tenders to be based on the execution, completion, and

delivery on the site, together with the furnishing of all material, tools, appliances, labor, etc., for the work as required and described by the plans and specifications for switchboards, panel boards and transformers. Plans and specifications and any other information required can be obtained at the office of the general contractor, P. Lyall and Sons Construction Co., Ottawa.

**Ottawa, Ont.**—Tenders will be received until March 18, 1918, for rolled steel casements and bronze covered frames and sash for the Parliament Buildings. All tenders to be based on the execution, erection and completion; together with the furnishing of all materials, tools, appliances, labor, etc., as required and described by the plans and specifications for (a) rolled steel casement; (b) bronze covered frames and sash. Separate tenders to be submitted for "a" and "b." The work included under this contract shall be commenced immediately on the signing of the same or at such time as may be directed, and be carried out in such a manner as to insure the completion thereof by Sept. 30, 1918.

**Ottawa, Ont.**—Tenders will be received until March 18, 1918, for heating and ventilating equipment required in the reconstruction of the Parliament Buildings. All tenders to be based on the execution, erection, and completion, together with the furnishing of all materials, tools, appliances, scaffolding, apparatus and labor required for the installation of the heating and ventilating equipment as called for in the plans and specifications. All information can be obtained at the office of the general contractors, P. Lyall & Sons Construction Co., Ottawa. A set of plans and specifications may be had by depositing an accepted bank cheque for twenty-five ($25.00) dollars, made payable to the Honorable the Minister of Public Works, which will be returned if the intending bidder submits a regular bid.

**Toronto, Ont.**—The city architect has issued to the Toronto Harbor Commission a permit for the erection of ferry sheds at the foot of Bay street to replace those destroyed by fire. The new buildings will cost $10,000.

# Lloyd George

## and the War

COL. JOHN BAYNE MACLEAN contributes to the March issue of MACLEAN'S MAGAZINE a strong article dealing with the need for efficiency in the Lloyd George Government and giving interesting information with reference to the young man who is rapidly coming to the front in Imperial affairs—Sir Eric Geddes, the head of the Admiralty. This contribution is one of a notable series.

### "SIXTEEN MONTHS IN GERMANY."

**What a Canadian Prisoner saw and heard there and how he escaped," By John Evans**

This article presents a picture of conditions in Germany and gives many new facts with reference to what is going on in that country. The writer worked for sixteen months in the mines of Westphalia and came in close contact at all times with the miners. The story of his escape is a thrilling one.

### "CANADIANS IN MESOPOTAMIA."

**By a Canadian Medical Officer.**

Little has been known heretofore of the campaign in Mesopotamia. This article gives details of the campaign and of the part which Canadians are taking in it. It shows how the inefficiency of the first campaign has been done away with and how splendidly organized the British army now is. The article contains many interesting anecdotes of adventure on that front.

### "LABOR THE DOMINANT FACTOR."

**By Agnes C. Laut.**

This is an article on the war situation as it is developing on this side of the Atlantic, showing that labor is becoming a dominant factor. In the United States the antagonistic attitude of the labor union is dying out and being replaced by a strong desire to assist in war measures.

### "CANADA'S NEW BOSS."

**By H. F. Gadsby.**

A political article, dealing with the "man behind" Union Government. It gives interesting and exclusive information with reference to the political situation at Ottawa as it is developing since the election.

### "A CASUALTY."

**By Robert W. Service.**

A war poem which tells of an experience which actually happened to Service while driving a motor ambulance on the Western Front. It will be illustrated by C. W. Jefferys.

## Fiction in the March Number

"BY THE TIP OF AN EYELASH," by A. C. Allenson, illustrated by R. M. Brinkerhoff. A bright story combining business, love and horse racing.

"THE GARDEN OF SPICES," by L. M. Montgomery, illustrated by F. Weston Taylor. This is a most unusual and charming love story.

Two long instalments of the two serials "THE PAWNS COUNT," by E. Phillips Oppenheim, and "THE MAGIC MAKERS," by Alan Sullivan.

"THE GIRL ON THE VERANDAH," by Arthur Beverly Baxter, who wrote "The Man Who Scoffed," and "Mam'selle Butterfly."

## Regular Departments and Features

There are the regular features and departments: Review of Reviews; Business Outlook; The Investment Situation; The Nation's Business; Books; Women and Their Work. A food article by Miss Chapman is a feature, and a new Spring Department on Seeds and Garden Culture starts in this number.

# Some Considerations Regarding Modern Plant Organization-I.

By M. H. Potter

*The factors which enter into the successful manufacturing business of to-day are interdependent to an ever-increasing degree. Location, type of building, transportation facilities, staff organization and plant equipment are features which require to be considered both singly and as a whole in relation to the particular product to be undertaken. A clear and concise idea of such considerations is necessary before entering any one line of manufacture.*

IN the present day progressive manufacturers must exercise every caution in choosing the site for a proposed plant. In the proper location of a modern plant and the construction of the various buildings required a number of features must be taken into consideration. Probably the first question to draw the attention of the owner or builder would be that of the cost. Many locations, admirable from other standpoints, are wholly out of the question when the cost of purchasing or renting is considered.

Fortunately for the manufacturing interests, land suitable for factory sites can be obtained in suburbs or suburban towns practically as suitable for the purpose and at a great deal less than metropolitan values. In many instances municipalities have offered houses and privileges to large concerns to induce the location of a factory in their town, considering that the benefit of the increased population and the consequent trade such would attract, and the prestige which would accrue to them, would be sufficient return for any bonds or privileges granted.

Although it is very seldom nowadays large manufacturing plants are centrally located in a large city, in some instances where skilled workmen are required Canadian manufacturers have made the mistake of locating in isolated localities, where they have experienced considerable trouble and delays in keeping their force at full strength. The welfare of the employees also has a direct bearing upon the question of location. All manufacturers, however, are not influenced to the same extent by this consideration.

Many large concerns of the present day will not locate their manufacturing plants in, or even near, a large city, but would secure a site with adequate means of communication, either by rail or water, with the outside world.

### Features of the Modern Plant

Modern practice in factory buildings adheres to the plan of making the majority of the buildings not over one storey in height, although the office building may be two, or three stories high, with the upper floors used as quarters for the engineering or drafting departments. In the buildings erected for the actual work of manufacturing, more than one floor is seldom employed. Quite frequently skylights are made in the roof, which admit light to all parts of the building, especially in the centre.

Additional floor space is sometimes obtained by increasing the height of the walls, permitting the construction of galleries which do not obstruct the entrance of light into the body of the room. The plant is not housed in one building unless it is comparatively small, but even here special quarters are assigned to machines the operation of which is accomplished by an element of danger or of unpleasant odor.

While the general architecture of a factory building is governed to a great extent by the character of the business, a feature frequently noticed in any modern factory is the size and number of the windows. In the great majority of manufacturing plants where no special menace to safety is encountered, fewer buildings, each covering a greater area, are more commonly employed.

### Transportation Facilities

Too much stress cannot be laid on the desirability of placing a factory where raw materials can be received and the products placed in the hands of the consumer with the least expense for carriage and handling. Remoteness from a means of transportation has frequently been a serious obstacle to overcome, particularly when the nature of the business was such that its location could not be changed.

The ideal location, from the standpoint of transportation facilities, would be one having a dock frontage, and also connected with either the main line or a branch line of a railroad. The ability to run freight cars into the plant is practically an absolute necessity where very heavy articles are manufactured. Usually in such cases, a spur of the track traverses the length of the erecting shop, and is so situated that the cars may be loaded through the agency of the travelling crane. Tracks are also laid connecting the various departments, so that heavy articles may be moved from one shop to another with the minimum of labor. Cars used only in the plant are made small and light so as to be propelled by small motors, or by the workmen themselves.

### Executive

In the executive office of a manufacturing plant, as well as in its practical work, changes have been made in order to satisfy the modern demand for accuracy and rapidity. Formerly an official, carrying the title of superintendent, bought all the supplies and raw materials, inspected them and distributed them to the foremen. In addition to these duties it devolved upon him to exercise a general supervision over the work. Countless other duties would also arise to take his time, with the consequence that any oversight he was able to give to the work was of the most cursory kind.

The drawbacks of such a system became apparent in time, and in the majority of factories the duties of the superintendent are now limited to those to which the name would apply. The buying is given into the hands of a purchasing agent, and an inspector is employed to examine the purchases. Receiving clerks, storeroom clerks, etc., are appointed and held responsible for the receipt of goods and the proper care of goods in stock. The selling end of the business is given into the hands of the sales department, the financial standing of prospective customers is investigated by a credit and collection department; a production engineer determines the amount of work to be performed, and the sequence to be observed in filling orders, and an assistant superintendent is detailed to oversee minor features about the plant.

By this systematization of duties the superintendent is relieved of the routine details that formerly had occupied his time, leaving him free to exercise a more thorough supervision over the plant, and direct the heads of departments in their work.

### Departments

The departments of a manufacturing plant vary, of course, with its size and with the nature of the goods manufactured. In a large plant they are usually seven in number: (1) power plant; (2) process department; (3) foundry; (4) forging department; (5) pattern-making shop; (6) assembling and erecting shops; (7) engineering department.

1. The power plant is usually placed in a separate building, and furnishes light, heat, and power. It consists of the usual arrangement of boilers, engines, dynamos, pumps, etc. Formerly no choice was permitted regarding its relative location. It had to be where the transmission of power by shafting and belting could be most easily accomplished. Since the advent of electricity, however, the ease with which electric power may be transmitted any distance has made it possible to locate the power plant where most convenient, usually by the side of the railroad track, where there are facilities for unloading fuel and removing waste.

2. The process, or general manufacturing department, usually occupies a number of separate buildings, each, or part of each, being devoted to some particular process. These buildings may be situated side by side, with sufficient space between them for a passage, and to admit light from all sides.

3. The foundry is usually located at some little distance from the rest of the plant, so that the dust and smoke may not interfere with work in other depart-

ments. Connection is made with the other departments by means of the shop track, and it is so advisable that the railroad track be permitted to enter the building for greater convenience in loading heavy castings. A branch of the same track extending along the side of the buildings is a great convenience for delivering fuel, pig or scrap iron and sand.

4. The forging shop is usually connected with the manufacturing end, and may be of large or small capacity, according to the character of forgings required. In some plants it may be connected with the foundry.

### Pattern Shop

5. The pattern shop provides all patterns required by the foundry or elsewhere, as well as special pieces or castings of experimental or other nature. This should have a well-lighted room or series of rooms, not too far removed from the engineering department.

6. Assembling or erecting rooms are connected with the various branches of the manufacturing departments by tracks and traveling cranes, and also admit a spur of the railroad for facilitating heavy work.

7. In the engineering department the engineers, draftsmen, etc., are engaged in preparing the plans, drawings and specifications for the work, and are usually assigned a floor in the main office building.

In addition to the above-mentioned departments a plating department may be necessary, wherein all plating with brass, zinc, nickel, or precious metals is effected.

There may also be a carpenter shop, a paint shop, storerooms for supplies, and completed products, a tool room, and an experimental room, each of which should be located so as to be most convenient for their purposes. With small articles it is usually sufficient if the shipping room is so arranged that a track or a number of tracks can be placed where they may be loaded from a platform with the least possible handling.

Large and heavy articles should be loaded by being deposited on the cars in the erecting room. In such an event, the clerical work connected with the shipping could be performed in the office building.

The general office or administration building may have any number of floors, the first one or two reserved for the work of the administration and accounting, while the upper floors are given over to the engineering and drafting departments.

### Following the Work

Tracing the work in its progress through the various departments may be of interest. Granted that the engineering and drafting departments have performed their duties, the pattern maker is furnished with all the necessary plans, drawings and specifications, from which he is to construct the pattern. This work calls for a high degree of skill, and requires absolute accuracy in its execution. When [illegible] completion it passes into the hands of the foundrymen, who use it to form an impression in the sand, into which molten metal is run. This, when solidified, has the same form as the pattern, but is comparatively rough and may require machining. Perhaps a part is required possessing a greater degree of strength than a cast article. In this case, the forge shop is called upon, and through the agency of hammers, anvils and other tools of the trade, the metal is beaten into the shape desired. When quantity production is required, dies are used. The forgings and castings next pass to manufacturing department, where all the processes of planing, shaping, filing, drilling, turning, and polishing are performed, resulting in the production of a finished part. Meanwhile the other parts of the finished article have been undergoing similar treatment, and all are passed along to the assembling room, where the various parts are joined in the proper manner into the completed product. This is tested in various ways, and if found perfect, and a customer is awaiting, is loaded upon a freight car and shipped, and so far as that particular construction is concerned, the duties of the manufacturing end of the plant are finished.

### Grades of Employees

Noticing briefly the personnel of the force of the average factory, one finds in direct control a factory manager, who gives his orders through a superintendent. The superintendent passes the order along to the foreman, of whom there may be a number, one over each department. Under the foremen are a number of gang bosses, who in turn oversee the work of a number of men. If a report has to be made when work is completed, it passes, step by step, from gang boss to foreman, and from foreman up until it reaches the factory manager.

This has a strong resemblance to red tape, but a certain procedure must be adhered to if business is to move along smoothly, and by following such a method dissatisfaction is seldom created by one official going over another's head. The only exception to this unwritten law applies to cases where an important official may detect a breach of discipline, careless or injurious use of tools or machines, waste of materials, or actions which endanger life, in which event he may demand that the action, whatever it is, should cease immediately, bringing notice to the person in charge of the offending workman.

All official communications should be written, and duplicate copies preserved, as in this way alone an accurate record of events is available, and responsibility can be traced to the proper place.

### The One-Building Plant

While we have here considered plants of several buildings or departments, the same general rules will govern the factory confined to a single building. The first requisite is to receive and assign material so as to eliminate unnecessary handling. How often have we seen shops of the older type, whose receiving and delivering rooms were at some out-of-the-way corner of the building, thus necessitating long carrying distances and inconvenient distribution. The modern shop will have such points located in some central room, convenient to the hauling platforms on the one side and to the workrooms on the other.

Materials received at this central point go the round of the building, from machine to machine, finally emerging from the finishing room direct to the stock room, which in turn adjoins the shipping department. A little care in planning a building with reference to the particular line of work, route to be followed in manufacture, size of finished product, location of elevators, etc., will work wonders in reducing costs, promoting efficiency, and last, but not least, keeping the force of workmen in good humor.

### Plant Efficiency

The prime object of the model manufacturing plant, whether large or small, is reduction of the cost of production. And this may be secured only by a combination of desirable quantities, known as plant efficiency.

The actual work of manufacturing in its bearing up efficiency, may be classed under two heads: general and special. General manufacturing has to do with the duties of the department heads, upon whom it devolves to produce results through the exercise of their special qualifications. Special manufacturing applies to the actual operations involved, and is of maximum importance. Any machine or contrivance that simplifies an operation or increases production is a factor in increasing efficiency.

In conclusion, it may be said that the problem of economical production is solved only through the agency of an efficient tool in the hands of an efficient workman—both being housed in a convenient plant.

## POWER FOR ELECTRIC SIGNALLING PURPOSES

WHEN in the early days of railway telegraphy electric repeaters were first introduced to indicate the working of signals, everyone seems to have agreed on an instrument which would work with a single cell of a primary battery, and to this day the efficiency of signalling apparatus is largely limited by the output which can be obtained from primary batteries. Moreover, there is an enormous number of these primary battery cells in use, as each signalling circuit usually has its own individual battery.

In large centres, at any rate, it should be more economical, and, what is of more importance, improved apparatus from the signalling point of view would result if, in place of individual batteries with limited output, current were to be obtained from a central battery of accumulators. There are also cases where it might be an advantage to use an alternating-current supply.

THE asbestos output of the United States has decreased 15 per cent., though the demand is greater than ever before.

# Developing a Self-Served Lunch System

By Gustave Keuchenmeister *

*The welfare of the employee is being considered by the progressive manufacturer to an extent unheard of a few years ago. It is a recognized fact that anything promoting the welfare and happiness of the employee is not only a credit to the manufacturer on humanitarian grounds but has a direct monetary and commercial value to employer and employee.*

THE steadily-increasing cost of food is felt as quickly by the workman as any other class. It becomes quite a problem for wage earners to meet expenses with prices constantly rising. Payments on homes, rent, and other fixed expenses must be met, so usually the first place retrenchment commences is on food, which often results in serious trouble. A well fed, well nourished man is better natured and more efficient than the man with an empty stomach, or, what may be worse, a stomach filled with poor food.

The problem of arranging a satisfactory lunch-time service at the plant of the Dominion Forge and Stamping Co., Windsor, became quite serious, as there were no restaurants or lunch rooms nearby for some time. A lunch room was finally opened next door, but the proprietor, however, soon realized that in order to hold the price down to meet a workman's pocket book, both quantity and quality had to be sacrificed, with the result that the lunches were edible and that was all.

Taking these things into consideration, and looking to the welfare of the employees, a lunch room was provided for, when the plans for rebuilding the plant were drawn.

### Tentative Arrangement

At first a small equipment—enough to serve tea, coffee, and milk, to the office force of about twenty men—was installed and experimented with. Sandwiches and pastry were bought ready to serve. Each day the order was telephoned to a bakery, and it was sent up in separate packages; also, any man could bring his own lunch and buy coffee, tea, or milk in the kitchen if he so desired. This worked out fairly well, except that almost every day some man found that he had not ordered enough and promptly began begging from his neighbors.

The experiment soon showed that the plan for a large equipment was feasible, and as the shop men pleaded to be served, a restaurant outfit was purchased. The kitchen as it now stands is equipped with the following:

One 10-gallon coffee urn.
One sideboard for dishes.
One refrigerator (white enamel lined).
One counter.
One counter truck.
One gas plate.
Two dozen white cups and saucers, plates, spoons, knives and forks.
100 1-pint white enamelware cups.

DINING ROOM FOR OFFICE STAFF.

100 black enamel trays (8 in. x 14 ins.)
Miscellaneous kitchen utensils, etc.

The lunch room for the office adjoins the kitchen, and the serve-self plan is carried out. The men of plant No. 1 are served from the counter truck ("a la cart," as one man jokingly remarked), which is loaded, put onto the elevator, and raised to the third floor. The men at plant No. 3, about a block away are served by carrying a large can of coffee and baskets of sandwiches, pie, and buns, to the plant.

The first week the shop men were served on the lower floor and they ate their lunches at their benches or any place they chose. One of the foremen, however, suggested placing tables in a vacant space on the third floor, and the suggestion was quickly acted upon, and found to be more satisfactory. Smoking is permitted during the lunch period on this floor only, and it brings the men together in a sociable way as well as providing a suitable place to eat.

### Typical Menu

No complaints about the quality or quantity of the food have been heard. A typical lunch consists of:

| | |
|---|---|
| Coffee, about two-thirds of a pint | .03 |
| 2 sandwiches, ham, tongue, or salmon | .08 |
| Pie, mince, raisin, or apple (cut in quarters) per cut | .04 |
| Jelly bar, doughnut with jelly inside | .03 |
| 1 sweet roll, various kinds | .02 |
| Total | .10 |

SHOP MEN AT TABLES ON THIRD FLOOR.

*Superintendent Safety and Welfare Department, Dominion Forge & Stamping Co., Walkerville, Ont.

COUNTER TRUCK LOADED READY TO PUT ON F FAV R

kept in store for the convenience of the men, and greatly appreciated.

By close buying, and watchfulness on the part of the cateress to prevent waste, the lunch room is self-sustaining, and consequently a successful venture, although not intended as a profit-paying investment.

## WATERS AND WATER-POWERS

THE ninth annual report of the commission of conservation contains extended references by the chairman, Sir Clifford Sifton, to numerous phases of conservation throughout 1917. Speaking of electric power plants he states that the preliminary survey of the water-powers of Canada is now practically completed. During the past year special efforts have been made to secure detailed information with regard to electric power plants and systems throughout the Dominion.

### Power Progress in Ontario

The development of hydro-electric power in Canada, and especially in the provinces of Ontario and Quebec, during the last ten years has been almost incredible. At the beginning of the work of the Ontario Hydro-Electric Power Commission, the late premier, Sir James Whitney, stated that the Commission would not require so much as 10,000 h.p. At this moment, the immediate requirements of the Hydro-Electric Power Commission in Ontario may be conservatively stated at 296,000 h.p., upon which demand there is a present shortage of about 70,000 h.p. A conservative estimate of the amount of power actually in use in the city of Montreal and its environs is 225,000 h.p. The position with respect to the province of Ontario, and especially with regard to Niagara Falls, is one which should be considered with great care. At the present time, the Hydro-Electric Power Commission is about 70,000 h.p. short, and it is not too much to say that this shortage will rapidly increase. I understand that Sir Henry Drayton has reported to the Federal Government that it is not practicable to withdraw this 70,000 h.p., which is presently in demand, from the United States to which it is now being exported, for the reason that the power is necessary for the use of plants which are producing essential war material for Great Britain and her allies. The position is, therefore, that, whereas, 12 or 15 years ago, it was not thought that the Hydro-Electric Power Commission could make use of 10,000 h.p., and, accordingly permits to export were more or less freely given, there is now, in round figures, an immediate demand for 300,000 h.p., and the demand cannot be satisfied.

### St. Lawrence Power Situation

A situation analagous to that in which Niagara power stood fifteen years ago now exists on the St. Lawrence river. A very large capacity for the development of power exists upon the St. Lawrence. There is a considerable development in the neighborhood of Montreal, but the greater portion of the power still remains undeveloped. Attempts are constantly being made to fataly complicate the position with respect to St. Lawrence power by securing the privilege of private development, which will be followed by contracts for the exportation of the power developed. I understand that the Cedars Rapids company exports something like 60,000 h.p. per annum. An attempt was made some years ago to secure the privilege of developing the Long Sault power, the purpose being to export the greater portion of the power in the interest of a manufacturing corporation on the United States side of the line. This project was defeated, largely through our efforts. A similar project is now being promoted, and wew are resisting it with all our energy and we trust with fair prospects of success. It is almost incredible that any responsible man should be so short-sighted as to favor this project in the face of the experience which we are now undergoing at Niagara.

### International Development Proposed

Within a very few years, there will be a demand for every horse-power that can be developed on the St. Lawrence river to which Canada is entitled for use upon the Canadian side. The situation with regard to Niagara will undoubtedly be duplicated, and if we are foolish enough to allow vested interests to be created upon the other side of the line, we shall inevitably find ourselves handicapped and embarrassed as we now are with respect to Niagara power. For myself, I have no doubt at all what ought to be done with respect to the great powers dormant in the St. Lawrence river. The United States Government is not interested in the corporations that are endeavoring to get possession of the St. Lawrence powers from the other side. Neither is the Canadian Government interested in the fortunes of the gentlemen who are promoting their projects on the Canadian side. They are very few in number, and their interests are confined entirely to themselves. What the United States Government and the Canadian Government alike are interested in is that there should be a fair division of this power, that it should be developed in such a way that the neighboring and tributary population should have the use of it upon fair terms.

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## GRINDING FIXTURE FOR 6 INCH SHELL-BORING CUTTERS

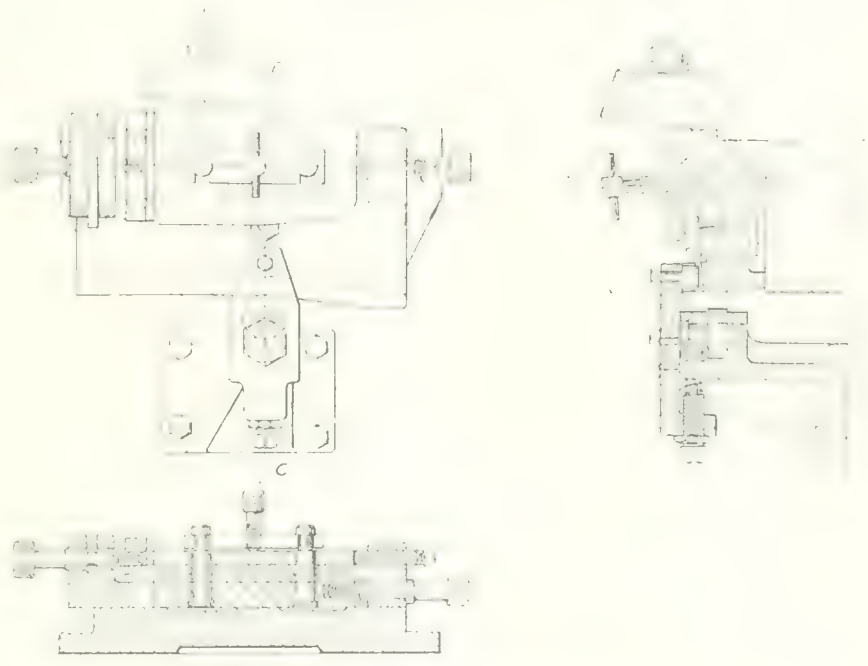
By Geo. M. Dick

IN the manufacture of almost all types of shells the most expensive part of the tool equipment to keep up is the boring cutter. This, no doubt, is the reason why it is given more consideration regarding manufacture than any other tool. Manufacturers of 6 in. shells will agree that the hardest part of the manufacture of the boring cutter for this particular shell is to get the radius right where the straight profile runs into the taper.

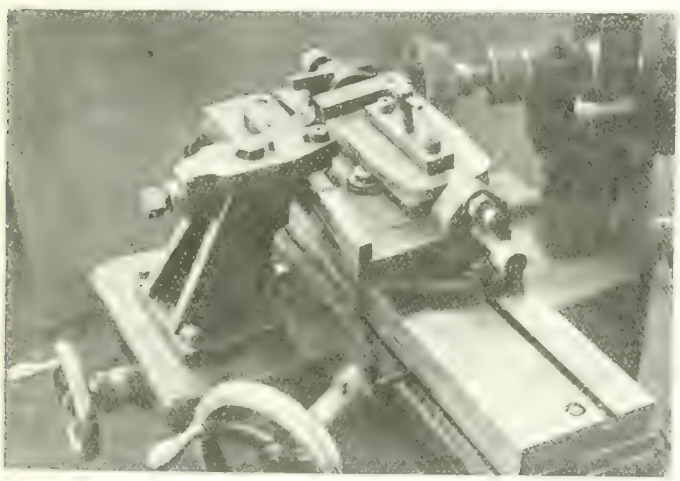
Various fixtures, etc., have been published lately, but none for this operation. The fixture illustrated has been used for some time with success, and should interest all manufacturers of this size of shell.

It consists of two parts, the lower being bolted to the movable table and the upper pivoted on it. A double cam is fitted to the upper plate to engage the rollers which are supported by the bracket in front. The rollers are adjustable to give easy travel to the fixture, as the table is moved across the wheel. The cam is arranged to turn the fixture on the pin as it passes the centre line, and runs off on the taper. The clamp pins are on a separate adjustable plate, which can be moved to take worn cutters, which require grinding further back. The cutter is first ground on one side, then turned over and ground on the other.

This fixture can also be used to grind the lip on the cutter by using a plain convex-faced wheel and setting the table and fixture lower. The fixture is set on the table in such a way as to grind a slight clearance on the rear end of the cutter.



DETAILS OF GRINDING FIXTURE.



VIEW OF GRINDING FIXTURE

## THE JOYS OF A MILLWRIGHT

By D. Middleton

THE Milo mill of the United Paper and Pulp Co. was a sort of dumping ground for the machinery that had outlived its usefulness in the company's other plants. And yet they were supposed to, and did, turn out the finest grade of tissue paper—which was a silent tribute to the men who would put up with such conditions and made a go of things discouraging.

Machinery of this class is heavy and is subjected to all sorts of sudden strains and unfavorable conditions in the way of location and dampness. The buildings of this plant were all of wood, the floors were wet most of the time, and the foundations were none too solid. Thus it was that shafting got out of line about every so often, and if it wasn't discovered in time the word would come that "the 4½ in. shaft in the beater room just broke close up to the hanger by the driving pulley." That being the only piece of that size on hand, and the orders being to get no new material where old could be used, it was up to the shop crew to shift the remaining length of 4½ in. along and splice out the gap with a piece of 4 in. or 5 in., whichever could be found out in the yard. Often this meant changing a couple of old-fashioned hangers that seemed to weigh a ton to the boys working up against the damp ceiling, and always it meant filling up one or more of the numerous keyseats in the shaft so they could run in the hangers at that spot. And then new keyways had to be cut by hand. The job had to be done at once, and there was no rest for the crew until it was finished.

### Fitting Keys

The showing that the plant made was due in no slight measure to Frank Maclay, the machinist, who would have done even better if there hadn't always been three months' work ahead of him which he had "to keep him busy," and to work on when something wasn't actually breaking. Maclay was the best man at fitting up keys that the writer has ever known, and it is from the experience gained while working with him that the writer has always since been able to guarantee a job of this kind that had been done according to instructions. Surely Maclay was right, for I never knew a pulley or gear in that plant to come loose, and the drives were of the hardest—and it gave one a sick feeling to be told to take a pulley or gear off a shaft that he had once keyed up. Some of Maclay's key maxims were: "I never expect to see a key that fits. If it doesn't fit the shaft; if you want me to put it up, I'll come to [illegible] put in a sleeve that will fit.

"I don't want any key put in that doesn't bear all around, top and bottom and sides; if it's going to drive more than two dog power, it won't last if fit-

[illegible] other way. Make it [illegible] enough [illegible] your keys so the [illegible] don't swell the key proper.

"Your hammer ought to weigh about [illegible] to the inch shaft, so a 3 lb. hammer on a 1 in. shaft, a 4 lb. hammer on a 1½ in. shaft, etc.

"If you're going to expect a key to stay in a shaft or hub, you've got to drive it home with something besides a chipping hammer. If the hub is too light to stand that without cracking it is going to give you trouble sooner or later anyway.

"I don't want any keys with a taper of more than a thirty-second in four inches. Give a man a taper key and he depends on that for a fit every time—thinks because he drives the key till it stops it is fitted; if he makes that kind of a pob tight he splits the hub at the top of the keyseat. When you are fitting keys by driving and trying and filing, use twice as heavy a hammer for driving [illegible] for driving in. If you see that you won't get the point end all swelled up. A heavy hammer drives, it does not swell locally. Put oil, just a little, all over a key every time you drive it in a hole, and you won't have stuck keys.

"The smoother your keyway faces are the tighter you key will be; a rough side on a keyway will impress its roughness in the key and may go so far as to loosen up the fit. Take time enough to fit your key all over for the full length—do that, get a tight fit, and you won't have to be doing the job over again every second Sunday. Make your key long enough so that you can drive it in further and tighter in about a week if the key is subject to a pull both ways or from

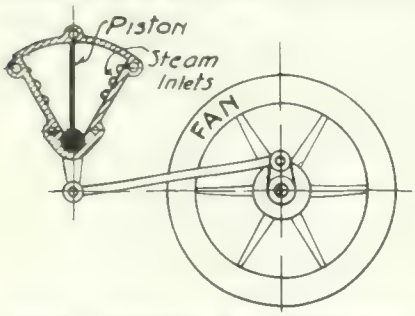


FIG. 1 PRINCIPLE OF NOVEL ENGINE.

right to full load and the strain is a heavy one."

### Unique Steam Engine

Supplementing the water power at this paper mill were several engines, rejected at other plants but doing fair service at Milo. One of these, Fig. 1, was a curiosity, to me at least. It had a "cylinder" of triangular shape, apex down. In this cylinder a piston-like fan oscillated on the shaft at the bottom. The valve admitted steam alternately on the sides of this piston, and the movement was transmitted by an arm outside the cylinder, through a connecting rod to the crank. They had shut down this engine at the time I was there—said it wasted too much steam. Another of the antiques had the cross-head guides made of wood; they were worn just as smooth as glass, and certainly presented a fine surface.

The best engine of the bunch was the 300 h.p. Corliss, on which a never-to-be-forgotten job was done. In shutting down for supper one night the engineer forgot to open the cocks—a fatal mistake, as the steam came a hundred and fifty feet through uncovered pipes. The back stroke caught the water and the connecting rod—of wrought iron—buckled, Fig. 2. On the forward stroke the rod failed to straighten out entirely when the cylinder head was reached, and the momentum of the flywheel crushed the key in the crank and everything stopped dead, for the key did not shear off. That was some key, and it was my job to get it out.

After two days of drilling with a ratchet, we were able to drive the key loose and get the crank off. The latter was sent to a shop in the nearest town

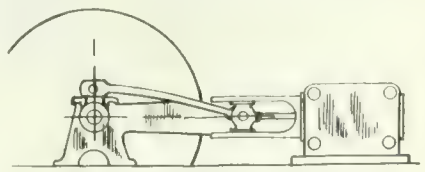

FIG. 2 BENT CONNECTING ROD ON CORLISS ENGINE.

to have the keyseat squared out and a key made. I started with hammer and chisel to re-cut the shaft end. By the time the crushed portions had been dressed up, a 2 in. x 3 in. key was needed—originally it had been about an inch less each way. Every inch of the fifteen-inch length of the shaft meant another blister for the fortunate chipper, and on top of that "old Moran," the superintendent, insisted on having a 1½ in. key put in at right angles to the other one to make the job doubly secure. And one afternoon he brought in a friend who said he could show us a way to cut the keyways in a jiffy. He suggested using a dentist's drill and boring the metal away. I told him steel was tougher than teeth, and old Moran looked at the 3 x 15 of steel and the husky pile of chips on the floor and suddenly thought of something in the office he needed, leaving me and dragging the dentist with him.

The forge was out in the barn, up the lane, and it was necessary to wade through the snow to go there and draw out the chisels. A diamond point was used to cut the path at the edge, then the center was readily cut out with a flat chisel without breaking the corners. A cape chisel and files were used to straighten up the sides and the bottom.

When the new keys came from the shop they were found to be two inches too long. We had no power saw, so they were chucked in the lathe and reduced with a cutting-off tool. The keys were fitted in good shape and finally driven home with a twenty pound sledge. We left a half inch—all that would clear the rod—projecting, and the Sunday following the starting up we managed to drive that all the way in. That was fifteen years ago, Maclay and old Moran are both dead, but the keys go driving on, and have never needed attention.

That lathe was a 20 in. affair that served the plant as lathe, shaper and drill press. An extension had been added at one time that allowed it to take 15 feet between centers. Somehow they managed to do a job on it that would pass, but when it came to turning the work that was over the extension, the lathe hand had to feed by hand for the screw had not been lengthened. A sharp watch had to kept of the size, too, when using the extension, to offset the persistent taper produced by the sagging back end. In the spring when the brook was high, the legs were awash, and the lathe man had to wear boots. In spite of these handicaps, all the lathe work of the shop was done here; it had to be, in fact, for Moran wouldn't give an order for any outside work "with a good machine out there standing idle."

## GRIPPING AND DRIVING METHODS FOR LATHE WORK—III.

By F. Scriber.

A group of small chucks and holders which are suitable for quite a variety of work and are mostly used on speed lathes and wood turning machines are shown by Fig. 17. Each of these chucks of which there are eight shown is used for a specific purpose as its name implies. All of these are held in the spindle of the lathe and those which are split are drawn back to grip the work. The shellac centre drives the work by having the same held to it by means of shellac. The screw centre usually has a wood screw end and wood is screwed on it while being turned, although this type of centre may be used with machine screw centre for holding nuts, etc., the block holding chuck has a centre pin and one or more driving pins in it, three being shown in this instance. The vee centre or holder is more often used in the tail-stock of the lathe for drilling cross holes

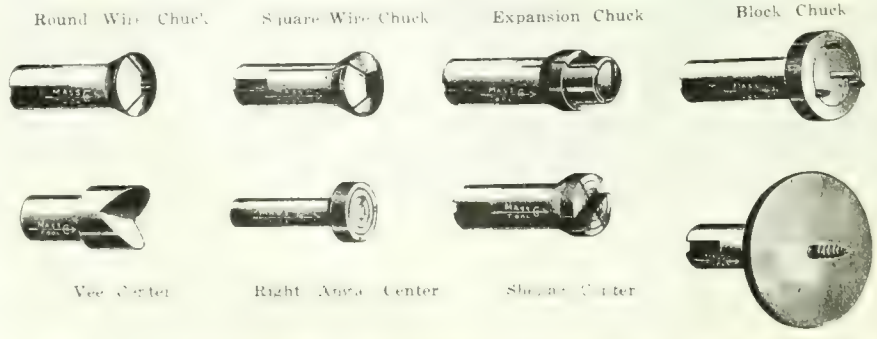

FIG. 17 A GROUP OF SMALL CHUCKS AND HOLDERS

and other similar operations. The work holding methods described in the foregoing article are of the simpler type and a number of more complicated tools used in the same field will be shown in the articles that are to follow and will include some face plate fixtures.

When mounting face plates with work or fixtures on a spindle nose where they are to revolve care must be taken to have them balance when the work is in position, otherwise it will be almost impossible to keep the work running true. In this connection it is also apparent that the faster the speed at which the machine is run the more accurate is the balance necessary to eliminate the pounding action which is in evidence when things are not in balance.

In this article considerable reference will be made to the face plate type of fixture and work holding methods, with a few notes on truing up work.

Fig. 18 shows a method for holding a gear segment; this segment has an arm hanging down the opposite side at X. When this part is set upon a face plate, as shown, with straps and holding devices in place, it runs in good balance and, consequently, need not be weighted. The face plate shown is of a type regularly furnished with lathes, the block A is put on the face plate under the two supporting arms of the segment. On top of the segment over this block a

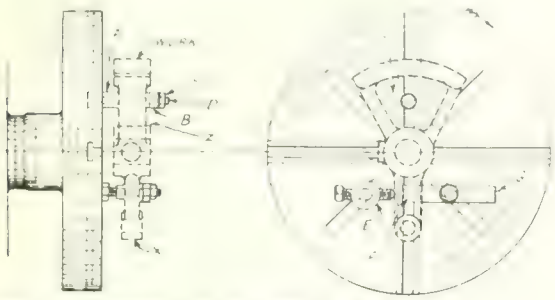

FIG. 18. METHOD OF HOLDING GEAR SEGMENT ON FACE PLATE.

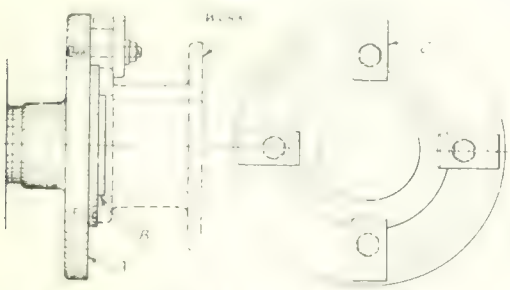

FIG. 19. FACE PLATE WITH RING FOR LOCATING WORK.

clamp is placed, and by means of the nut and washer C, together with the tee bolt D, the work is gripped on one side. At the opposite side on the arm the stud E with screw in it is placed; this takes the thrust of the cut which is in the direction of the arrow, while a jack screw F is placed under the arm; over this screw the strap G is used for clamping. This securely holds the work in place, and the same is trued up from the short boss Z. The method shown for gripping this piece is not one which would be good for manufacturing purposes, as it is a rather slow set up, but is a good practical method for handling small lots.

Fig. 19 shows a special face plate mounted on a lathe spindle; this is used for holding the work shown while performing the second operation, the first operation having been performed in a chuck. This fixture consists of a suitable cast iron plate A, which can be screwed on the spindle nose. On this plate a steel disc B, that has been machined the correct diameter to fit into the recess at the

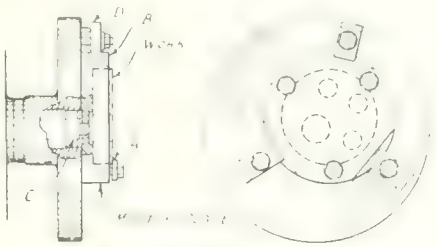

FIG. 20. ACCURATE BORING WITH MASTER PLATE.

end of the work, is securely held in place by screws and dowels. Four clamps C are also provided for holding the work in position on the face plate.

The use of a master plate for boring work accurately is often resorted to where a number of holes have to be bored. An example of this is shown in Fig. 20, where it will be noticed that the work is a round disc with four holes bored in it. This is held by means of the screws and washers A, which are three in number, in a round plate bored out to receive it, this being designated as B. In the centre hole of the machine a plug C is placed and the plate which holds the work has four holes in it bored to receive this plug. In setting the work up on the machine one hole in the face plate is set over this plug, thus locating the work in the correct position for boring. The plate is held to the fixture by means of the three clamps D. When one hole has been bored the disc is removed and again slipped over the plug in the position where another hole should be, and by continuing in like manner until all four holes are bored, each piece can be made a duplicate of its predecessor as far as centre distance is concerned.

### Test Indicators

In boring work on face plates it is often necessary to use test indicators to find out when it is running true; a group of these tools is shown at Fig. 21. The first of these in the upper left-hand corner is used in the tool-post of the lathe and the short end is placed in contact with the surface of the work which we wish to indicate true, and, as the opposite end of the rod is so much longer than the point end, slight inaccuracies at the indicated surfaces are much multiplied. Two extra rods are shown with this indicator.

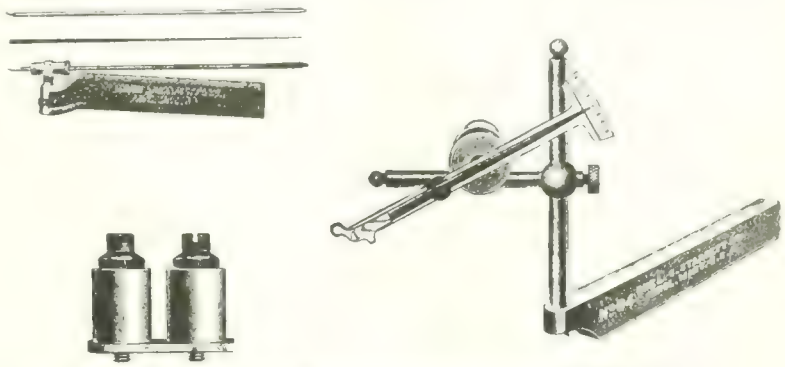

FIG. 21. TEST INDICATORS AND BUTTONS FOR LATHE WORK

In the right-hand view an indicator is shown, which is used in somewhat the same manner as the above, and has a scale which tells when the work is true. This indicator may be used for quite a variety of purposes: The indicator shown at the right is quite universal in its application, and is particularly good for outside indicating. With this tool inaccuracies are read on the scale.

The use of buttons for setting up work

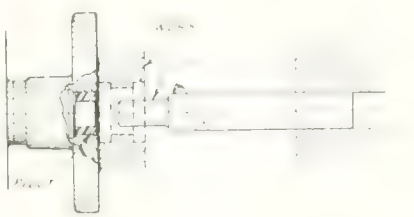

FIG. [illegible]. METHOD OF USING PILOT FOR BORING BAR.

is quite general where accuracy is required, and two of these are shown in the lower right-hand corner of the illustration, Fig. 21. In using these buttons the holes are located approximately by means of the dividers and scale, following which a small hole is bored and tapped in the work. The buttons are then put in position and by calipering from

are better to the next the pattern can be located accurately. The battens are held in place by screws, and as the hole inside of the buttons is bored out larger than the screw, they may be moved slightly one way or the other. When set

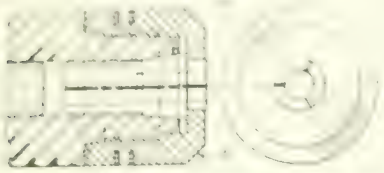

FIG. 21. SINGLE CHUCK ON SPINDLE NOSE.

in position they are securely held by tightening the screws, and with the work set on the face plate they are indicated true by means of one of the test indicators before described.

When taking heavy cuts on work, as in manufacturing, it is often desirable to pilot the boring bars or facing tools in some manner. This is quite conveniently accomplished, as shown in Fig. 22. A hardened steel bushing is ground, and is forced in the face plate of the lathe or automatic chucking machine. A pilot is turned down and ground on the boring bar at A. This pilot enters the bushing before the boring tools start to cut, thereby steadying the same and permitting heavier cuts to be taken than would otherwise be possible.

Spindle nose chucks in quite a variety of forms are used for gripping work in lathes or chucking machines; these are generally operated by similar principles, various methods being employed for drawing back the spring chuck A (illustrated in Fig. 23) to make it grip the work. This illustration shows a common spindle nose cap B used to force the chuck back, thereby collapsing the same and causing it to grip the work. The chuck is hardened and spring tempered, so that when the spindle nose cap is released the chuck will spring open. The beveled surface A is the part that closes the chuck when it is forced in the spindle.

## PATTERN MAKING NOTES

By J. W. Broadbent

WHEN turning patterns on the face plate it is essential, in the majority of cases, to use an intermediate face plate of wood. The design and method of building up these wooden face plates are exceedingly numerous, some even approaching the ridiculous. The main object is to have the face plate strong enough to hold the work to be turned and sufficiently stiff to prevent the possibility of warping and twisting out of shape; at least, during the period when the pattern to be turned is secured to the face plate.

### Face Plate Construction

For small jobs up to 12 inches in diameter, a plain circular piece of wood from 1 in. to 1½ in. in thickness may be used, and if further strength is required a batten may be screwed to the back as shown in Fig. 31; this batten being wide enough to take the iron face plate. Fig. 32 illustrates a face plate suitable for turning work up to 24 inches in diameter, three or more boards being joined together with cross pieces. This face plate is simple and inexpensive, and at the same time will be found to be more rigid for practical use than one built up in a more elaborate manner. No glue should be used on the cross-bars of the face plates Fig. 31 and 32; screws alone being sufficient to hold the different sections firmly together and yet allowing the wood to swell or shrink with the changes of the temperature or the humidity of the atmosphere, without distorting the flat surface of the face plate to any appreciable extent.

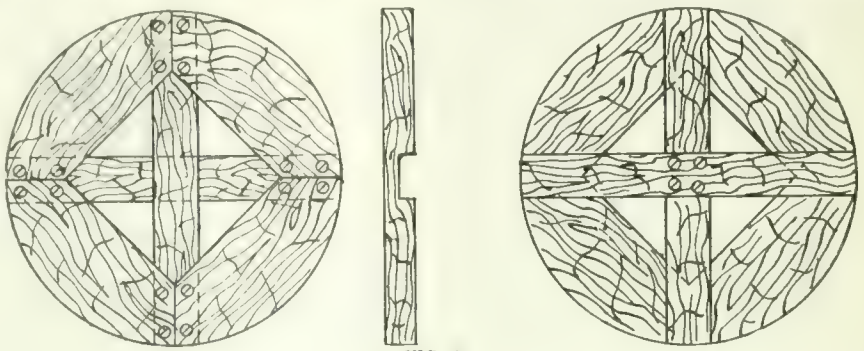

FIG. 33.

Fig. 33 shows a sketch of a face plate built up of four segments glued and screwed to two cross-bars, these bars being joined together at the center by a half-lap joint as shown. This makes a very substantial face plate for work up to three feet in diameter, as it maintains its shape and is easily trued up. The cross-bars should be made out of stock 1½ in. thick and 4 in. wide, and the segments of 1¼ in. material. A face plate built up of sections as shown in Fig. 34 keeps its shape very well, but being rather heavy is not suitable for work over three feet in diameter. It is obvious that the joints of the sections in each course should overlap. For work of large diameter a face plate as illustrated in Fig. 35 is probably the strongest method of construction, the number of arms and segments being increased proportionately with the diameter of the plate; the one here shown is quite suitable for work up to eight feet in diameter.

### Rechucking of Work

There are very few examples of patterns which being turned on one side, and then removed from the face plate to be rechucked for operations on the opposite side, necessitate the mutilation of the face plate for the purpose of centering the work. When a rush job comes into the shop and there is no suitable face plate available, or the face plate has been turned down so thin that you could read a newspaper through it, there is a liability of language being used by the workman who is doing the rushing. The only sane method of rechucking work is to nail or screw several pieces of wood upon the flat surface of the plate, these being afterwards turned so that the job is a snug fit, and therefore centering itself sufficient to allow the holding screws to be driven.

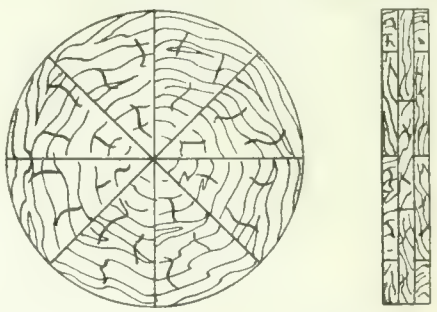

FIG. 34

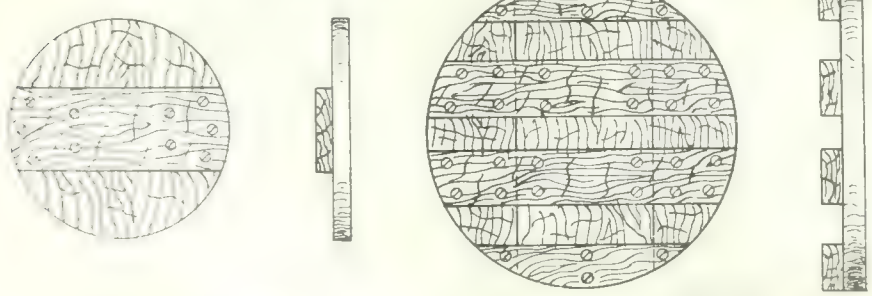

FIG. 35

### Turning Tools

The turning tools used by the pattern maker are not very numerous, and the best results are obtained by the use of those having a scraping rather than a cutting action. The only exception among the hand turning tools is the skew chisel shown in Fig. 36. It requires considerable skill to use this tool effectively, the cutting edge being held tangentially to the piece to be turned so as to get the real cutting action. For

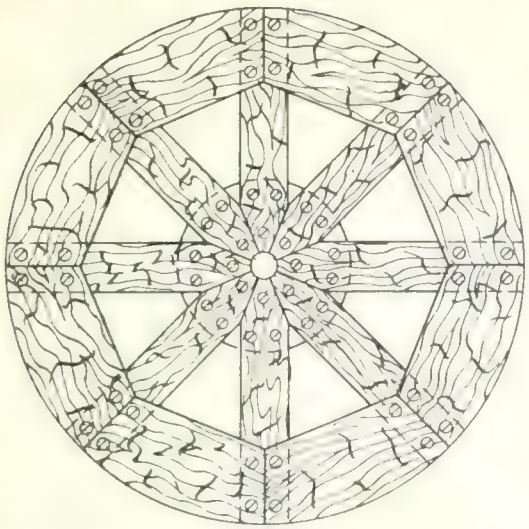

FIG. 35

comprise part of the kit, and another very useful tool is shaped as in Fig. 42 which may be used for turning the inside of hollow patterns. It is a well known fact that if a crowbar is held against a rapidly revolving piece of wood that the crowbar will tear off chunks of wood, making the piece to be turned—in appearance round. A well turned piece of wood is to be admired that the uninitiated look with a certain degree of wonder at the comparative ease with which the pattern maker manipulates his tools, producing the even, smooth surface so much desired in a good pattern. The secret of successful wood turning is in keeping the tools sharp and in good condition, and by no other means can a smooth finish be obtained.

getting a smooth finish on the work this tool is admirable but for accuracy the scraping tool is to be preferred. The turning gouge with its rounded cutting edge is shown in Fig. 37, this tool being adapted for roughing down the work, and in the hands of a skillful operator very little finishing is required after using this tool. When turning hollows or fillets the gouge has a "mulish" habit of kicking, and for operations such as these the round nose Fig. 40 should be used. Fig. 38 is the square nosed tool for finishing flat surfaces, and Fig. 39 the spear point for end turning. Right and left hand side tools Fig. 41 should

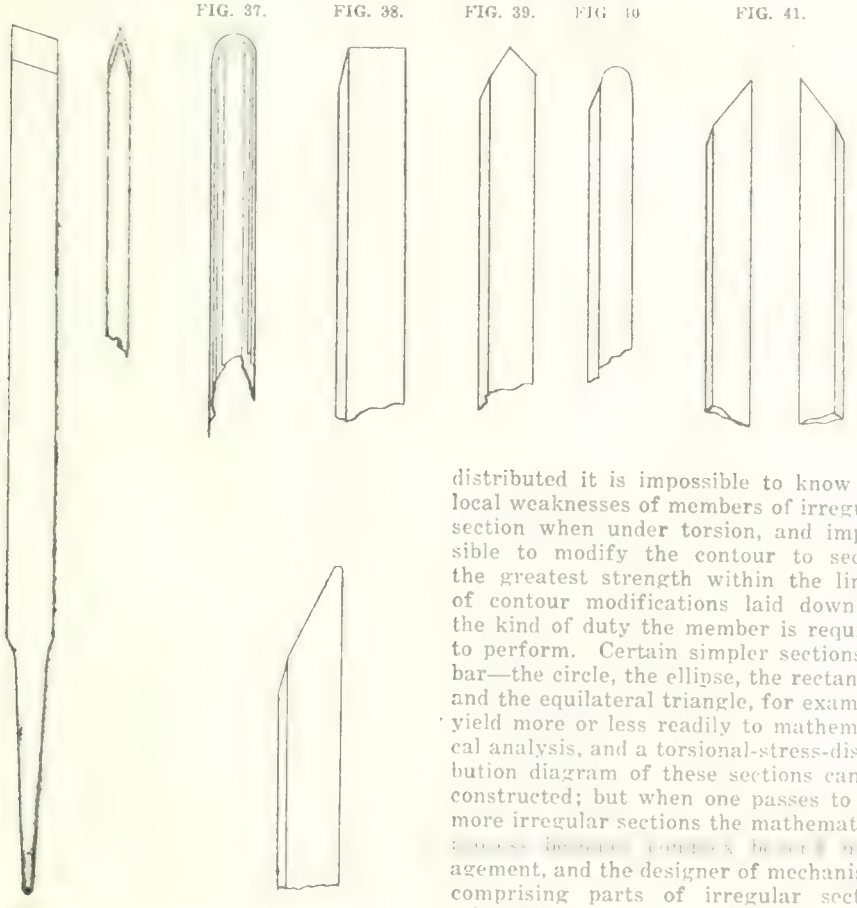

FIG. 40 FIG. 42

## A NEW METHOD OF SOLVING TORSION PROBLEMS

THE ascertainment of the distribution of stresses in members subjected to torsion is a problem that has occupied many mathematicians and physicists, for without a knowledge of how such stresses are distributed it is impossible to know the local weaknesses of members of irregular section when under torsion, and impossible to modify the contour to secure the greatest strength within the limits of contour modifications laid down by the kind of duty the member is required to perform. Certain simpler sections of bar—the circle, the ellipse, the rectangle, and the equilateral triangle, for example, yield more or less readily to mathematical analysis, and a torsional-stress-distribution diagram of these sections can be constructed; but when one passes to the more irregular sections the mathematical [illegible] agement, and the designer of mechanisms comprising parts of irregular section subjected to tortional stresses has had to work very much in the dark. A leading modern instance is afforded by the case of the aircraft propeller. The propeller blade is subjected to a particularly complex combination of stresses, among which is the torsional stress set up by the greater air pressure on the following portion of the curved face of the blade being greater than that on the leading portion. The shape and dimensions of the blade section at any point are determined within limits by considerations other than resistance to torsion, e.g., by the requirements of streamline and propulsive efficiency contour, and by resistance to bending, but there remains a certain latitude within which modifications can be made to secure the maximum resistance to torsion. It is of extreme importance that design should take cognisance of this factor, not so much because risk of fracture is thereby diminished as that, unless the distribution of the torsion stresses is known, it is impossible to forecast how the blade will deform in use, and consequently impossible so to shape the blade in its unstressed condition that it will present the desired features when under working stress. About a year ago the design department of the Royal Aircraft factory at South Farnborough came up against this problem and the authorities called in Major G. I. Taylor, R.F.C., for assistance in solving it. Starting from a suggestive hint given by Professor Love in his treatise on elasticity to the effect that the equations for the torsion of an elastic bar are of exactly the same form as those for the displacement under evenly distributed pressure of an elastic membrane, the shape of which corresponds to the cross-section of the bar, Major Taylor saw that if he could devise a calibrating instrument based on this remarkable parallel his problem would be solved. The essentials of the required instrument were first a thin metal plate, out of which a section corresponding to the cross-section of the blade could be cut, next a thin membrane stretched across the slot, next a slight excess air pressure on one side of the film, and finally a means of registering the contour of the surface of the bulged film. The first requirement was easily satisfied. For the second, a soap film stretched across the slot suggested itself as the ideal membrane. The pressure on one side of the soap film was provided without difficulty by clamping the plate over a box within which the air pressure could be delicately adjusted. The real difficulty came in determining and recording the contour of the film, and this was solved by the use of two particularly ingenious expedients, first the reflection in the film of a suitably placed single electric lamp filament, this for determining the inclination of the film to the plane of the plate at any given point for the determination of stresses, and, secondly, the use of a steel needle point- [illegible] as to depth by micrometer—this for tracing the contour lines of the film and recording them by pin-pricks on a sheet of paper. By cutting in the plate, alongside the slot of the section it is desired

stresses in the circular bar represented by the round hole, their actual value. The film analogy, as brought within the do- genius of Major Taylor, and translated into a working instrument by Mr. A. A. whole credit for devising the apparatus, opens out at one stroke a whole range of precise knowledge on a subject hitherto obscure, and constitutes one of the most beautiful inventions in scientific method that the world has seen for many a day.

## GAUGE FOR TESTING THE THICKNESS OF BASE-PLATE

By G. Barrett

THE gauge or marker described below has been found of considerable use and merit, as by its use a permanent mark may be made on the outside of the shell, indicating the depth of base-plate. Previous to the making of this gauge the only check the Government inspector had was his stencil stamp, and this being faced off at times, necessitated the removing of several base-plates and their replacement by screwed ones.

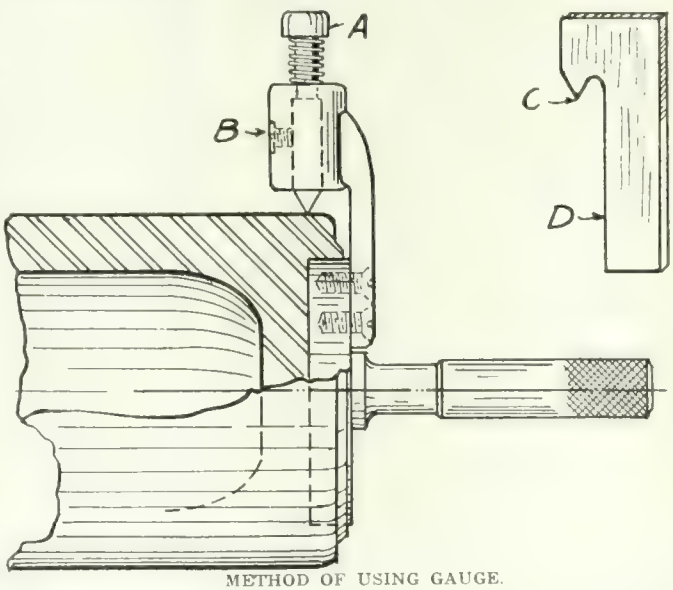
The gauge is used during preliminary inspection and is very simple. The shells are laid flat on the bench and the plug gauge is placed in the recess with one hand and given a light tap with a hammer at A, Fig. 1, which leaves a small mark at any given distance from the bottom of the base recess. In this case it has been arranged to mark .490 in. to correspond with the low thickness. There is a grub screw in the boss B to compensate for any looseness which may occur. The spring is provided to keep the punch clear of the work while being placed in position.

After the shells have been faced on the base and there is no symbol mark to be seen they are tested with the gauge, Fig. 2.

This gauge is made from 3-16 in flat steel, and the point C is made 60° and rounded to suit the pointer, Fig. 1. Also the distance from D, Fig. 2, to the point has to check with the low thickness of the base-plate after being faced off. If the base-plate is under the low the gauge, Fig. 2, will fit beyond the prick mark made by the punch.

## JEWELLERS' ROUGE

[illegible] have to be finally polished with rouge, and this is not easy to obtain in the finest condition, although the purchased material is good enough for the ordinary plate cleaning. For this reason, where actually the finest and best is needed, it should be made by Vogal's process as follows:—Into a solution of sulphate of iron, made with boiling, distilled or rain water and carefully filtered to remove any accidental solids, pour a concentrated solution of oxalic acid until no more precipitate is formed. When precipitation ceases, and the whole is quite cold, the precipitate is collected on a fine cloth and washed with hot water until the washings cease to give an acid reaction on blue litmus paper. When well drained, the precipitate in its partially wet state is placed on a clean iron plate over a slow fire, or preferably a brass ring, and heated, decomposition beginning somewhere just above 390° Fah., and the red oxide is formed at a rather higher temperature, jewellers' rouge being merely finely-divided red oxide of iron. By this process the finest possible division of the particles is secured, and, although troublesome to make, this should always be used. The finest putty powder—tin oxide—is also prepared in a somewhat similar manner.



METHOD OF USING GAUGE.

## STREET VACUUM CLEANER

A vacuum street cleaner has been purchased for use on streets in the Panama Canal zone and was placed at work this week. It is a motor propelled vehicle carrying a sheet steel bin divided into two compartments. A large blower is driven by a 18 horsepower gasoline motor, and by this means dust and dirt are lifted from the street just as a vacuum cleaner for house use does its work. Stiff brushes mounted in front of the suction-head stir up the dirt so that it may easily be lifted by the suction. The cleaner covers 12½ feet at each operation, and runs at from three to five miles an hour. It operates on dry streets, does away with the cost of sprinkling, and saves in labor cost, as it cleans about 200,000 square yards in eight hours, and is operated by one man, the chauffeur.

## IMPROVISED SAFETY COLLAR

By J. E. McCormack

WHERE no safety collar of the right size is available, an old-fashioned one may sometimes be used (for light duty) by marking the set screw at a point even with the surface of the collar when screwed home against the surface of the shaft. Then remove the set screw, saw it off at the mark and slot with hacksaw or file. In tightening the screw down on the shaft use a bit shank screwdriver and a carpenter's brace.

This is sometimes useful when rigging up additional shafts or refitting machines not yet conforming with safety-first requirements.

## WILL RELIEVE GAS SITUATION

THE Ontario Legislature has unanimously passed the Natural Gas Act, giving the Ontario Railway and Municipal Board wide powers to control and regulate the production and transmission, distribution and sale, disposition and consumption of all the natural gas produced in Ontario.

This was an emergency measure taken to relieve within the next twenty-four hours the serious situation existing in various parts of the province which depend on natural gas for heating purposes, but especially the city of Windsor and district.

The Ontario Railway and Municipal Board is now in complete control of the situation, and has power to brush aside all private corporations, and the Minister of Lands, Forests and Mines, who introduced the measure, made it clear that the people of the province are to have first call on the gas supply for the purpose of heating their homes, and that important industries engaged in the manufacture of war supplies and the production of food supplies are to come second.

## U.S. STEEL PRODUCERS EXPECT COMPETITION

THERE are many well informed steel producers in the United States who do not hold the opinion that a heavy foreign demand for steel will follow the close of the war. On the other hand, they believe that the United States will be confronted with severe competition from European steel manufacturing centres.

The statement has been made that Europe will need millions of tons of American steel for rebuilding purposes. This view is not taken seriously by steel men who have watched the development of the foreign steel industry since the beginning of the war.

Great Britain, Canada, Germany and other countries have not only greatly enlarged their steel capacity, but have made remarkable headway in the matter of economy and efficiency. The increased capacity has not been fully reflected in production since the war, as demand has been confined largely to war needs requiring high-grade steel. After the war, however, Europe will be in a position to show its capacity as a producer of strictly commercial steel.

# Fundamentals of Apprenticeship: National Interest Grows-III.

Special Correspondence

*Industrial education is today the principal educational problem in this country. Employers, business managers, superintendents, thoughtful craftsmen, educators, economists, social workers, men and women in a hundred walks of life, have focussed their attention with growing earnestness upon the problem. Discussions, proposals and theoretical and practical experiments are gradually leavening the great mass of our industrial life.*

THE question of apprentice wage is important. Investigations have shown a wide variation in amounts paid to apprentices, not only during the first year, but for the succeeding apprentice years; also that these variations were as great in a given industry as among industries in general, and, what is even more interesting, the wage differences were as great in the same locality in a given industry as they were throughout the country. Out of a total of 451 shops in a certain trade that made report upon the wages paid to apprentices, the following table of first year payments will show the extent of this variation:

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| 4 | shops | paid | $1 00 | 101 | shop | paid | $5 00 |
| 2 | " | " | 1 50 | 1 | " | " | 5.50 |
| 10 | " | " | 2 00 | 66 | " | " | 6.00 |
| 9 | " | " | 2 50 | 10 | " | " | 7 00 |
| 76 | " | " | 3 00 | 5 | " | " | 8.00 |
| 10 | " | " | 3 50 | 8 | " | " | 9 00 |
| 8 | " | " | 4 00 | 1 | " | " | 9 50 |
| 22 | | " | 4 50 | | | | |

[illegible] averaged $4 81 per week

In discussing the question of apprentice pay the Conference Board was presented with a considerable number of "customs" and "rules" that prevail among American industries and a consideration of the data furnished brought up the following questions:

Shall the wages be paid by the hour, day, or week?

Shall any piece-work rates apply?

Shall the wage be uniform in the same trade in all localities?

Shall it be uniform in the same trade in the same locality?

Shall the rate be based on a specific proportion of journeyman's wages usually paid in the same locality?

If so, what is the proportion during each year of apprenticeship?

Shall wages be paid during the total period, and how much?

Shall wages be advanced uniformly to all apprentices or shall special merit be considered?

Shall a bonus be given for faithful service; and if so, on what basis, and when?

Three of the above questions, those referring to trial period, piece-work, and bonus, are specially discussed hereafter. Concerning the other questions the following is offered:

The Conference Board believes that the best interests of all concerned, employer, apprentice, and industry, will be best served by the payment of a standard apprentice wage. While it is readily admitted that apprentices, under the thorough training system advocated by the Conference Board, will acquire a fund of information that will prove to be a most valuable asset throughout life—yet, because the apprentice is in the industry and a producer, he therefore is entitled to receive pay and upon a basis as near standard as the conditions and customs of the trade will permit.

### Apprentice Wage Should be Standardized

The Conference Board does not believe that the method of payment, whether by the hour, day, or week, is of great importance, although it would be desirable if the method of payment could be uniform in each industry. The Conference Board does believe, however, that the apprentice wage should be standardized wherever possible, and recommends that the employers of a given industry in each general locality come to an agreement thereon. While it may not be possible to standarize the apprentice pay throughout a country as vast in extent as the United States, due to local and journeyman wage conditions (for instance, the rate at New York might quite properly be different from that prevailing at New Orleans), nevertheless the apprentice wage in a given industry in New York should be uniform, and the apprentice wage in a given industry in New Orleans should also be uniform.

A uniform locality wage for apprentices will prevent discontent upon the part of boys working in one shop where the rate may be lower than in another similar shop in the same community. It will also prevent the "stealing" of boys—that is, one employer offering an apprentice of a competitor an increased wage if he will come to him. This "stealing" or enticing of boys from an employer is unlawful in some states, but it is nevertheless practiced, as many employers have good reason to know. The Conference Board does not believe that anyone should be prohibited from seeking employment wheresoever one desires to work, nor that an employer shall not employ whomsoever he may wish to employ, but inasmuch as an apprentice-student is receiving instruction under a definite agreement to teach and receive upon the part of the employer and boy, it would be greatly to the boy's disadvantage to have this relationship of teacher and student broken, even though it be for a temporary financial gain. Consequently, it should be impressed upon the apprentice that he should honor his contract and fulfill it—afterwards he may do as he desires.

That the apprentice shall receive periodical increases would not seem to need discusion, because as he progresses in his work and studies he will become more productive. Although he may not earn his first period wage, nor possibly his first increase or two, nevertheless, if he has been selected for mental, physical, and moral fitness and has been carefully trained in both the practical and technical things of the trade, he will eventually develop to a point where his earning capacity will fully repay the employer for the time and money spent upon him.

In reference to the wage rate to be paid, this Conference Board, as a result of its investigation, is led to make the following suggestion:

That the apprentice wage have a definite relation to the normal journeyman's wage; that the first payment be about one-fourth of the recognized journeyman's wage; that periodical increases be graduated during the period of apprenticeship until it reaches about one half of the journeyman's wage during the last apprentice year, and that these increases be made each six months.

It must not be overlooked that as a matter of fact the apprentice receives additional compensation in the special attention paid to him and the selected training given to him.

As an example of the above-suggested wage rate an apprentice would receive, under a four-year apprenticeship, in a trade where the journeyman rate was 40 cents an hour, the following payments:

Ten cents an hour for the first six months.

Eleven cents an hour for the second six months.

Twelve cents an hour for the third six months.

Thirteen cents an hour for the fourth six months.

Fourteen cents an hour for the fifth six months.

Sixteen cents an hour for the sixth six months.

Eighteen cents an hour for the seventh six months.

Twenty cents an hour for the eighth six months.

At the end of his apprenticeship term the apprentice should be paid at least the prevailing journeyman's wage.

### No Piece-work Payment During Apprenticeship.

The great Scotch political economist, Adam Smith, says, in his discourse upon the Wages of Labour,—"The produce of labour constitutes the natural recompense or wages of labour." While this is undoubtedly true for the adult worker, and is the basis of piece-work payment, it could not apply to immature youths whose living necessities approximate those of the adult but who have neither maturity of judgment nor dexterity of hand to provide those necessities.

*Copyright, "Conference Board on Training of Apprentices."

will follow if instruction has been given, but the employer must recognize the fact, as previously stated, that the apprentice cannot be expected to earn his wage and his instruction expense until he has been developed for a certain period, varying with the individual boy.

Piece-work payment to apprentices, as generally practiced, has two unfortunate tendencies: it specializes the boy, as neither boy nor employer is anxious to generalize the boy's work when he has developed special proficiency in a given operation, and it retards technical or class-room instruction, as neither boy nor employer is desirous to interrupt productive labor. It may have the advantage of impressing on the boy the true value of his labor, but this can be done in other ways.

### A Trial Period With Pay.

Apprentice training as recommended by the Conference Board is based upon an indentured apprenticeship, a written agreement for a specified time, for the performance of mutual duties at specified wages. All this is duly set forth hereinafter. As an agreement of this kind binds the employer to fulfill certain obligations, and as the performance of these obligations requires the expenditure of both time and money, it is not to be supposed that the employer will enter into such a contract until he knows the sort of boy-material with which he will have to work. Consequently, the Conference Board recommends that two or three months be considered a trial period, during which time the employer can judge the qualifications and capabilities of the boy, and this period also gives to the boy and his parents an opportunity to judge if the trade is congenial to him.

This trial period should be a part of the apprenticeship term during which all the conditions on both sides would apply, including wage payment as previously discussed. The indenture should not be executed until the boy shall have proved his fitness.

### Periodical Examination of Apprentices.

Just as the trial period should determine the boy's fitness to continue in the learning of the trade, so should there be periodical examinations of apprentices. One of the troubles with most apprentice training, particularly where there is no applied technical instruction, is that there are no regular check-up periods when the apprentice must demonstrate his progress or non-progress. Because of lack of such examination the apprentice is allowed to drift, often passing from one detail of work to another before he has theoretically and practically mastered the one he was working upon.

When the apprentice realizes that he must regularly prove to his employers, through examinations, that he has improved by observation, study, and trade practice; also that his continuance in the trade and his wage advances are dependent upon a fair percentage of progress, then will he apply himself the more diligently to his mental and physical tasks.

Where the apprentice department is under a competent supervisor and instruction is organized in both shop and class room, periodical examination of apprentices would naturally be a part of the system. Where there is no organized apprentice department and apprentice instruction is carried on in simpler form, more under the immediate supervision of the employer, the periodic examination can take place at convenient times, but it should not be omitted.

The Conference Board suggests that a form similar to that below could be used to advantage, this form to be signed by the foreman of the department in which the apprentice receives his practical trade training (or other authorized person), and that the half-yearly increases in the apprentice's wage be given upon the basis of this certification.

### Length of Apprenticeship.

From earliest times to the present, the term of apprenticeship has varied, dependent upon the age of the apprentice, the nature of the industry, and the skill of the boy or girl.

In olden days a boy was usually "bound out" under indenture papers until he was twenty-one years of age, a girl until eighteen years of age, or marriage. In modern American plants the term varies from one to seven years.

Certain industries as a whole have, through committees, studied this subject for the purpose of arriving at a time that would be best for the trade and the boy and have adopted a standardized apprenticeship period. The organized employing printers, for instance, have recently adopted five years as the standard apprenticeship period for their industry.

In some cases the apprenticeship term is based upon a total number of hours instead of a number of years.

### Cash Bonus at Completion.

The giving of a bonus to the apprentice upon successful completion of the apprenticeship term dates back to the old apprentice laws, in vogue not only in Western Europe, but also in many of our own States. It was specified in statutes just what the bonus must be. The following brief abstracts may be interesting:

"Fifty dollars in gold and two new suits of clothes to be worth in the aggregate at least $50.00."

"A new Bible, and two new suits of clothes to be worth respectively $15.00 and $25.00."

"A small allowance, the amount to be left to the master's generosity . . not less than $100.00."

This ancient custom has been applied in a modern way by many employers and with hardly an exception they agree that it is a beneficial thing to do.

To earn the bonus the apprentice realizes that he must have a high rating in attendances, morality, shop practice, and class-room work. It is a prize to work for, a preventive of restlessness. The Conference Board suggests that the amount of the honus be at the rate of $25.00 for each year, payable at the end of the complete apprenticeship term.

It should be borne in mind, however, that a bonus (as stated on foregoing page) should not, in the judgment of the Conference Board, be understood as a part of wages to be paid. It should be a voluntary reward for special efficiency attainment, in order that the apprentice, who is working under agreement upon a uniform wage scale with other boys, may have an incentive to develop his individual capabilities.

There is no gainsaying the fact that some trades are simpler than others and consequently easier to master; but it should not be forgotten that while the manual and machine operations that make up a given industry may be relatively simple, nevertheless the boy or girl and the future mental state of each must be considered, as well as the profits to be derived from his or her service.

Merely to teach an apprentice the motions of machinery and the part he must perform to keep the machine productively employed is not apprenticeship.

In addition to the machine and manual motions every trade has its mathematics, mechanics and science, all of which should be taught, and, moreover, an insight into the history of the craft and of related industries.

The teaching of these subjects will take time, but this time is necessary to develop manipulative skill and intelligence. This is an economic as well as a patriotic necessity.

As a result of inquiries and deliberations upon the subject of "Length of Apprenticeship," the Conference Board suggests the following as illustrative cases:

All-round machinist, four years.
Tool and die maker, four years.
Pattern maker, four years.
Carpenter, three years.
Blacksmith, three years.
Steamfitter and plumber, three years.
Sheet-metal worker, three years.
Moulder, three years.
Printer, five years.
Lithographer, five years.

# PROGRESS IN NEW EQUIPMENT

## A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

### GAP LATHE WITH QUICK CHANGE GEARS

THE gap lathe illustrated herewith has several improved features which render it suitable for work requiring strength and extreme accuracy, and in the design of the gap and gap plate a feature has been incorporated which allows the large face plate and thin work to swing without the removal of the gap plate.

The bed is deep and rigid and is provided with three V's of liberal proportions, the head-stock and tail-stock each resting on one V and on one flat surface, and the saddle on two V's and the flat surface. The box leg is hollow and is provided with a shelf for extra parts.

The head-stock is of the three-step cone double back-geared type and is equipped with phosphor bronze bearings. For convenience in operating, the back gear shifter is located on the front of the head.

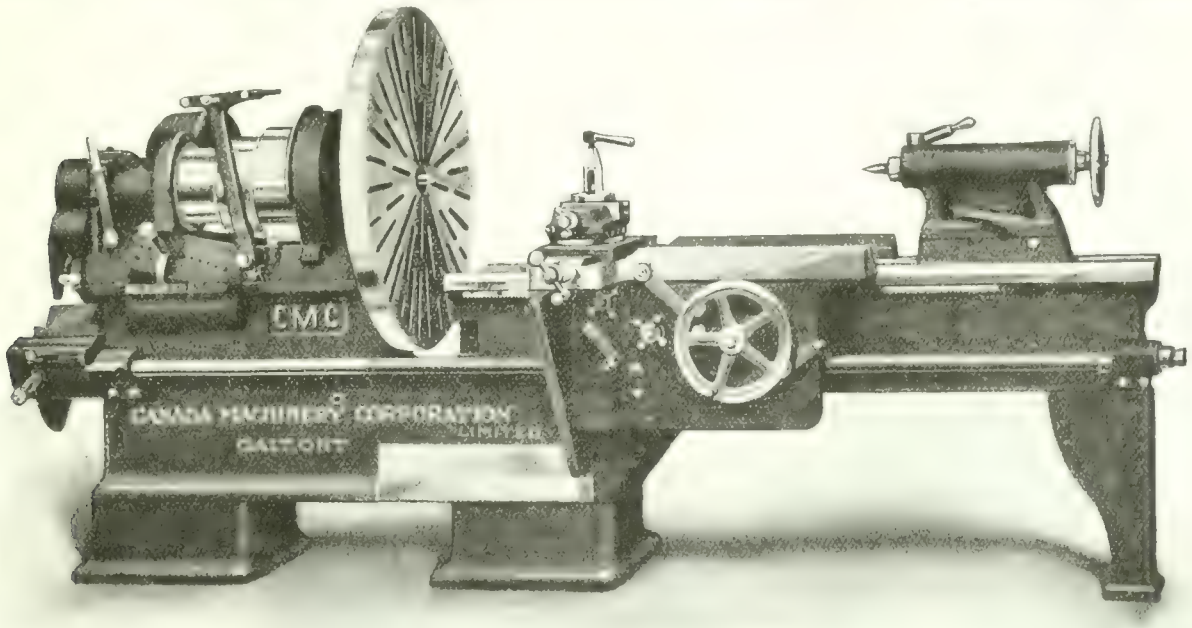
The belt shifter shown forms a standard part of the equipment, and the arm on the lathe with a corresponding arm on the counter-shaft provide a rapid means of shifting the belt to any cone without danger to the operator.

The feeds and screw cutting changes are obtained by the movement of a lever to any of the different stations as shown on the index plate. It is impossible to engage either the longitudinal or cross-feeds when the lathe is set for screw cutting and vice versa. The feeds may be instantly reversed in the apron by a convenient lever, and the saddle is securely clamped when using the cross-feed. The lead screw is reversed for right and left hand threads by means of a reverse plate on the head. All gears are securely guarded.

A thread-chasing dial is provided for indicating the correct point for engaging the nut for thread cutting.

The tail stock is rigid and heavy [illegible] is so shaped as to permit of the compound rest being set at right angles without interfering. The tail-stock is adjustable across its base by means of a screw to permit of its being set over to turn tapers, the base being graduated for this purpose.

The Canadian Machinery Corporation manufacture this lathe in 18 in., 20 in., and 24 in. sizes, which swing 32, 38 and 44 in. over the gap respectively. The width of the gap, clear of the face plate is 12 in., 15 in. and 16½ in. for the three sizes.



IMPROVED GAP LATHE WITH QUICK FEED CHANGE GEARS

### MULTIPLE SPINDLE DRILLING MACHINE

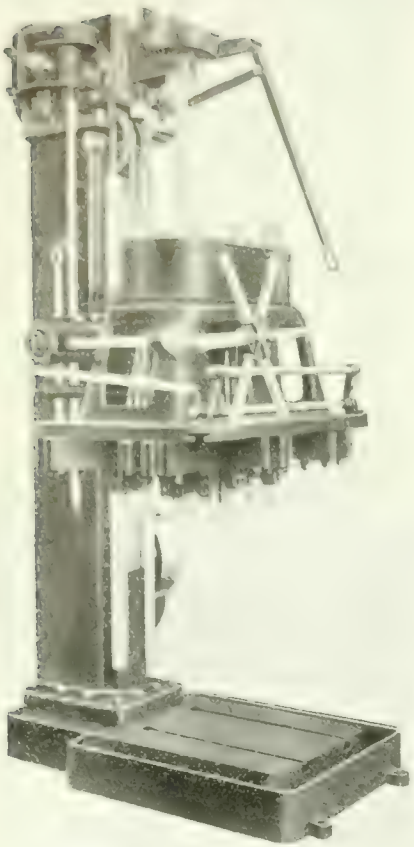
THE machine illustrated above has several features which render it particularly suitable for quantity production. Quick change speed gear boxes and quick change feed gear boxes have been eliminated. These features have permitted the operator to change the speeds and feeds against the wishes of the foreman. The speed and feed change gears are located in boxes with hinged covers, and with the machine are furnished extra gears so that speeds and feeds can be changed as reuirqed for different pobs.

The lever used in starting and stopping is also used for reversing in tapping operations.

The main driving pulley is located on the side of gear box on top of column. Power is transmitted direct to bevel gear which is used in conjunction with an internal expansion friction clutch on both forward and reverse speeds. These clutches are adjustable for wear and operate in an oil bath. The power is transmitted to the speed change case, from which point it is transmitted to bevel gears to the head.

The feed of machine is taken from main drive shaft, and when the drills are stopped the feed also is stopped. The changes of feed are made by changing of gears on the machine. The power is transmitted from the gear cases to a vertical shaft, which drives a feed worm located on the traveling head. This worm in turn engages a worm wheel, which works in conjunction with the feeding mechanism of the head. The engagement and disengagement of power feed is accomplished by a positive clutch of the "saw tooth" type. The pilot wheel for raising and lowering the head, and the lever for engaging or disengaging power feed are located at the front of machine, thus keeping all operating levers close to the operator.

The standard construction provides two speeds for each spindle in the head.



MULTIPLE SPINDLE DRILLING MACHINE.

The two speed features are part of the standard equipment of every machine.

This machine is manufactured by the Fox Machine Co., Jackson, Mich.

## BORING, REAMING AND FACING MACHINE

A SPECIAL boring, reaming and facing machine, built by the Reed-Prentice Company, Worcester, Mass., to bore, ream and face a steel forging used as an engine support in an automobile is illustrated herewith.

The work is held in quick acting clamps mounted on the revolving triangular turret of carriage. All of the operations are automatic, with the exception of placing the work in the machine and indexing the turret. Each time the work holder is revolved 120 degrees the finished piece at the top is removed and another rough forging is placed in position with little loss of time.

There are four spindles—two on each of the opposing heads.

Two pieces of work are operated on simultaneously. The cycle of operations is as follows:—The carriage moves toward the right; during its travel one piece is drilled and a second piece faced on one side. The carriage then automatically moves toward the left, during which travel one piece is reamed and the second piece faced on its other side, after which the carriage returns automatically to its neutral or starting position, at which point the feed is tripped automatically.

The turret is now indexed by the operator; the finished piece removed, and a new piece of work placed in position. The feed is then manually engaged and the cycle of operations begins again.

A 10 horse-power Westinghouse type S.K. direct current motor is used to drive this machine.

## FLUID GAUGE COMPARATOR FOR PITCH DIAMETER

ONE of the most difficult problems before the country at large to-day in connection with the manufacture of aeroplanes, motor trucks, ammunition, ordnance, guns, etc., is interchangeable and accurate screw threads. These are particularly important on account of the large scale upon which the manufacturing operations are being planned, and also because the different parts of the large production necessary will be manufactured in widely separated and diversified plants, and in no way can interchangeability be assured, except by a positive and accurate means of comparing working guages and master gauges, one with the other.

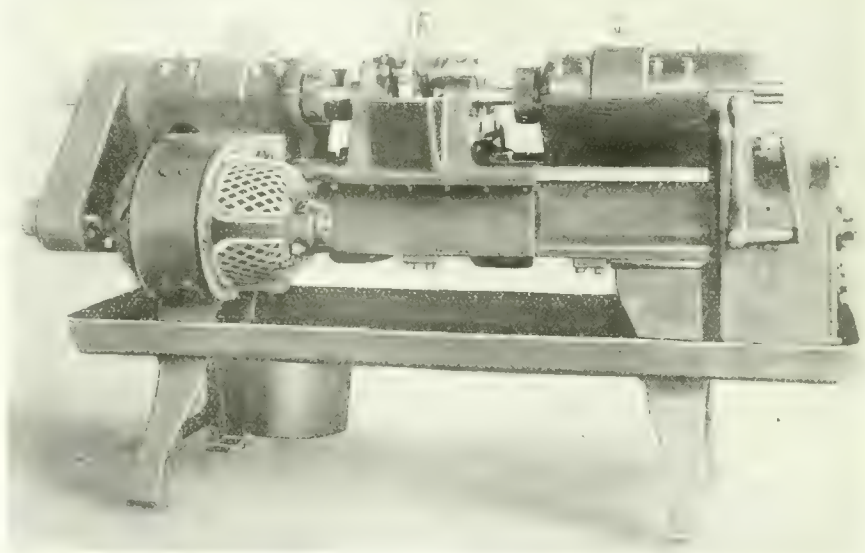
This comparator was originated by Mr. J. H. Wilhelm in charge of the Gauge Division in the Ordnance Department of the United States army, and is so designed that it can measure the pitch diameter on all thread gauges ranging from ¼ in. up to 10 ins. in diameter, and with equal facility and accuracy. It furnishes a handy, accurate, rapid method of comparison between working gauges and master gauges, giving the differences to the most minute quantity, and may be used for establishing the value of a master gauge by its use in combination with the Swedish gauges or other standard blocks which have been properly verified by the Bureau of Standards.

The elements of the machine are a base and an upright overhanging standard. In the base is carried a perfectly true lapped steel plate, which is set absolutely square with the hole through the center of the standard through which slides a bar carrying the upper measuring points which are in the form of a double roll and which rest on both walls of the upper part of the thread to be measured. Underneath the thread gauge to be measured are placed five-sided parallel blocks made with the same accuracy as standard space blocks, the two upper surfaces coming together in an angle equalling the angle of the thread to be measured. These are set on the lapped steel base plate and the gauge to be measured rests upon them, the walls of the thread being in contact with the angular upper sides. This method gives us an accurate and convenient pitch diameter comparator.

Extreme accuracy in reading is obtained by the use of the Prestwich Fluid Gauge. The upper thread measuring contact or roll is carried on the lower end of a vertical sliding spindle. The upper end of this spindle rests against the bottom of the diaphragm of the gauge, and the slightest movement of the upper measuring contact, in this way gives a certain reading on the column of the Prestwich Gauge, while the thread gauge being measured rests on the lowest angular parallels and passes under the upper measuring contact.

A second thread gauge passing through, if it is the same size, will give the same reading on the gauge, if it is larger it will cause the column to rise proportionately higher, if it is smaller, the column will not rise as high as before, and the difference may be directly read from the scale on the gauge to a great degree of accuracy, this scale being graduated to one ten thousandth part of an inch.

In order to establish the size of a



BORING REAMING AND FACING MACHINE

thread gauge by this comparator, in conjunction with the standard space blocks, the required size is first built up with the blocks, one of the angular five-sided blocks placed on top of them, and then the arm carrying the upper thread measuring contact is vertically adjusted, so that the contact fits over the angular sides of the blocks and the gauge column is at a mean specified height.

In this way the comparator may be set for any size absolutely without recourse to any other measuring machine or a master gauge, and the amount that a gauge is above or below on pitch diameter as set by the standard space blocks may be readily read on the scale of the fluid gauge.

The Coats Machine Tool Company, Inc., 30 Church Street, New York City, manufacturers in the States of the Prestwich gauge, has this comparator for sale as one of their specialties. It is a precision instrument, and one which is absolutely needed for the accurate measurement of pitch diameter of thread gauges, as ordinary methods of measurements on threads, such as with the ordinary pitch micrometer, three wires, ball point micrometer, etc., are only good enough for ordinary work, and cannot be used to check precision thread gauges.

The Government has had one of these built, and it will be advisable for the manufacturers to have some means of measuring the gauges which they may have to supply to the Government.

PRESTWICH FLUID GAUGE

## CANADA ATTRACTS SOLDIERS

### Many Veterans of the European Conflict Will Cross the Seas to Share in Development of the Dominion, After the War

"There will be many time-expired men from my regiment who will want to come to Canada when the war is over" writes Major D. Hector Pearson of The MacLean Publishing Company's staff, who is now a prisoner of war in Turkey. Major Pearson's words bear out the belief which gains strength from many similar indications from every camp and fighting front, that after the war the hardy men who have held the lines against the Hun will still want to be in the forefront of the economic battle called "after-war trade." Canada's place in that fight as in this is over the top every time, and the attractions of the Dominion for the soldier-spirit are immense. Immigration will certainly re-

## AMERICAN NAVAL PROGRESS

ACCORDING to the 1917 annual report of the American Navy Department, there are upwards of 800 vessels being built for the navy, ranging from battleships to small petrol craft. It is also stated that a considerable number of 3-in. anti-aircraft mountings have been completed and supplied to ships in commission. Gratifying progress generally is recorded. The rate of production of armour-piercing projectiles has greatly increased and the quality of the projectiles now being delivered is better than it has been in the past. The almost unlimited capacity of the country for projectile making was indicated when sixty-nine firms bid on one proposal and at prices lower than any previous tenders.

*He started in a humble way, all freckled, country made, he dropped into a suit of jeans and went to learn his trade. He took a hammer and a wrench, a measure and a rule, and made a scrape at everything that harkened like a tool.*

*He wasn't much to gaze upon, he wasn't five feet high, but had a strong and honest look and a twinkle of fun in his eye.*

*And every little job he got he did the thing up brown, he went from bottom to the top and from the top came down. He'd try a thing up every way, he'd see it right and left, and all the time he heck, his fist was growin' trained and deft.*

*He didn't stay long in the class of guesser at a thing, nor did he ever take a chance, or waste out a string.*

*He met each day that came along on Time's and a bit's edge—he met each thing it bore, no deal was matter small or big, he never dodged the little job, he seized it in his paw, he licked it to a finish and whacked it on the jaw.*

*And he never did a crazy trick, he never bid a man to make some chap feel cut and cry, and was to be spoken.*

*He's coasted up a peg somewhere, he just couldn't stay in the shop, he's bolstered up with praise many an able prop.*

*And some fine morning from the shop he'll step, and while others talk and argue, though they was he'll know what he can tell you, he'll step right up without a word, for all was this "THE MASTER OF THE JOB" WERK*

## THE NEW STANDARD

MORE and more are the biggest men in every country turning their attention to the problems of the human side of industry. It's an encouraging sign, too, to notice that there's a deal more common sense being put into the discussion than there ever has been before.

There has been nothing short of a plethora of material about the hackneyed topic of "capital and labor." Formerly it used to be "master and servant." The change in name is simply indicative of the change in years.

The hopeful part of the situation is that the moral side of the matter is coming more to the front. True, it has only taken the form of academic discussion, but the element is showing itself in more ways than one.

It is coming to be recognized that men are more than the human part of mechanical equipment.

Quite surely we're getting pried loose from the idea that a man is good for only what can be squeezed out of him.

As large a man as Charles M. Schwab has said something very pointed on this matter. The very fact that Schwab is behind these words make them more forceful:

> "My good fortune is not the money which I have, but the fact that I am able to say that my possessions are for the good of my fellow-citizens."

Again, in reference to the place that labor is going to occupy in the future Mr. Schwab goes as far as to state that it will dominate the world. If a man of less size than Schwab said this he might be put down as a fanatic. But here it is:

> The coming aristocracy is to be composed of men who have done something for their country and the world at large."

That's a pretty broad plane on which to stand the people of this and every other age. And it's hard to see how any man can complain about it. If he gets crowded off the edge it will be because he's done nothing worth while that justifies standing room for himself.

If the future measurement is going to be on the basis of doing something worth while, there's quite a few people who will have to get up on their toes in order to make a showing big enough to justify their vocation and life work.

## STRIKING A STRIDE.

CANADIANS are rather slow in realizing that they are absolutely and really developing along industrial lines. It is an easy matter to note such growth in single, local cases. It is an entirely different thing, and certainly more difficult, to get a nation-wide view of the case.

The Wall Street *Journal* of recent date has the following. Canadians should read it and get the drift of what it means:

> "Canadian foreign trade for ten months of 1917 approaches $2,000,000,000—a per capita of $2,500. Of but recent development, the volume of commerce for the whole year will doubtless nearly equal in dollar value our own foreign trade for 1900, when we had 97,000,000 people. With but one-thirteenth our man-power, Canadian exports and imports will exceed one-fifth of our own.
>
> "At least $500,000,000 of war bonds have been purchased by Canadians. The Ministers of the Crown were justified in the implicit confidence which they placed in the Canadian instinct of thrift. There are racial and political differences in Canada, but thrift in common, homely household terms, is a Dominion-wide virtue, characteristic of the passive and the inaggressive, as well as of the industrious and ambitious. There is in Canadian thrift a saving grace, an indistinguishable attribute of the Scotch Presbyterian Ontarian and French-Canadian Habitant."

Canadian export trade is not a dream. For a long time we were content to pay visits to big American and British plants, and spend a couple of months after trying to figure out how it happened.

Canadians are developing. They are getting an aggressive, industrial nerve they never had before. They are beginning to believe in themselves.

And as yet the Dominion is only scraping on the industrial surface.

## CAN'T DOWN THIS MAN

CANADIAN railroads are much the same as railroads any place else. They run into problems they can meet—and they come across others that floor them.

The Weatherman can tie railroads up in a knot. He can wink at their organization and snap his fingers at their efficiency. The figures go to prove it.

On February 4 the Canadian railways moved from the Niagara frontier 1,082 cars. That is not high—in fact, it's rather low.

Then came the cold weather. The engines lost their punch and the snow piled in the switches.

The number of cars moved fell to 745. On the 6th it was worse, and the number went down to 720. In a few days the worst was over. These figures show the "comeback" the railroads had:

| | | |
|---|---|---|
| February | 7 | 1,130 |
| " | 8 | 1,164 |
| " | 9 | 1,274 |
| " | 13 | 2,000 |

NO life is worth living, no death worth dying, unless behind these there are unnumbered days of exertions and strivings in world-betterment accomplishments.

# Indenture Apprentices To Secure Best Results

## Gives a Stability to the Whole Plan That Makes for Complete Success—This Has Been Tried for Twelve Years at the Factory of the Dodge Mfg. Co.

THE question of apprentices, their treatment by the firm, their obligation to the company, and also the obligation of the company to the apprentice, are all matters that are receiving an increasingly great amount of attention. In many places this matter is still looked upon in the light of a fad used by some men who want to hang a system on every department of their shop. Fortunately this idea is getting more remote every month. War conditions have interfered seriously with the apprenticeship system. At the same time the scarcity of apprentices has brought many a manager or superintendent to think more seriously over the matter than he has ever done before.

### A Wholesome Sign

To one who gives any amount of thought or study to the matter at all, it becomes apparent that the two sides of the apprenticeship problem are receiving a more evenly distributed consideration than they ever did before. Managers and superintendents are taking a keener interest in the boys that come under their care. They are in many instances urging them to supplement their work in the shop with study at night in some technical training school. There are cases where these heads of firms insist on this being done. They want their apprentices to go out from their shops properly equipped to make their way in the industrial world, and they want them to have the training that will make it possible for them to go ahead and fill the best positions that are opening up in their line of work. Not only so, but if the mechanic remains as a journeyman in the shop where he was an apprentice, it is also in the interest of the firm to have him a thoroughly capable workman.

### The Dodge Co. Plan

Particular attention is paid to the apprentice system at the plant of the Dodge Mfg. Co. in Toronto. In fact, their whole apprenticeship system is based on the indenturing of apprentices. Unless a boy goes in as an indentured apprentice, the Dodge people do not encourage his employment. They realize that the signing of the paper constitutes a binding agreement between the boy and the firm and the boy's parents or guardians, and they find that it has a good influence in making the boy take a serious and continuous interest in the work which will in all likelihood become his life's vocation.

Mr. J. Shand, the factory superintendent, has been with the Dodge Co. for fifteen years. He takes a very great personal interest in the working out of the apprenticeship system, as does Mr. Wheaton, the general manager of the company. Mr. Shand discussed the matter with a representative of CANADIAN MACHINERY.

In answer to a question concerning results, Mr. Shand said: "We get the best results from the indenture plan. In fact, we will not take an apprentice any other way. If there are other boys taken on here it is only for temporary work, and we do not feel under any obligation to teach them a trade or any part of it. We always try to make them see the advantage of entering the shops in the regular way as a duly accepted apprentice.

### The War's Influence

"Then we have a number of our apprentices who had served part of their time, but who are now overseas with the Canadian forces. We will be willing to make allowances for these fellows when they come back," continued Mr. Shand. "They will be older and capable of doing more work, and I don't think we will have any trouble in arranging each individual case so that the soldier can start in and complete his training where he left off." The Dodge Co. take on apprentices for machinists, tool makers, molders, core makers and pattern makers, and many of the boys who have passed through their shops are now in positions of responsibility with some of the best concerns on the continent.

### How It Works

The Dodge Co. do not pay the apprentice his full wages during the time he is serving his four years' training. They hold back each pay an amount which is equal to about one cent per hour. At the termination of the apprenticeship period this amount, small as it may seem, has amounted to approximately $100, which the firm pays over to the newly-made journeyman. Not only is the apprentice that much to the good, but he has had a practical and a real demonstration of what small amounts will amount to if regularly saved. It has been a good lesson in thrift, as well as an anchor to hold him down to business during the period of his training.

### Well Satisfied With It.

"From your experience, would you say the system used here is quite satisfactory?" queried the visitor.

"Decidedly so," replied Mr. Shand. "I have had a chance to watch the operation of this plan for a period of twelve years now, and that has given a good chance to prove my statements. We also try to get our apprentices to keep on with their studies. We like to get lads here who have passed the entrance examinations. That gives them a start, but they must keep on with their studies. We encourage them to attend night school and technical classes. It is almost impossible to put too much stress on the importance of apprentices keeping up their studies apart from their work in the shop."

The war has taken a number of good men from the Dodge factory, especially when the call came from England for mechanics a year or so ago. It has also interfered with the apprentice system, but not permanently. The company have a carefully prepared document, setting forth in detail every obligation resting on the firm and on the apprentice. They try to live up to their part of the agreement, and make it worth while for the boys to live up to their end of it. They get results, and that's what they're after.

---

SOME apprentices have stayed with their firms and forfeited better pay in munition shops. They have made a temporary sacrifice, but they will gain in the end. The big call for the future in Canada is going to be for trained men in all lines. And by trained men we mean those who are going beyond the stage of handymen.

* * *

RAILROAD men are now engaged on the task of making their rolling stock work more days per year. In 1916 it is known that an average of four days was required to load a car, and the same time was again consumed to get it under way again as an empty. These figures, on the face of them, are staggering, but they are given out by the railway board as absolute facts. The higher demurrage charges have caused a tumble in the figures. It's a pretty stiff and hopeless proposition to expect Canadian roads to make a showing against this condition.

EFFICIENCY is a term frequently used, but as often difficult to define. In no place is this more in evidence than in the average industrial plant, and one of the chief reasons is probably the vagaries of the human mind—a factor that is a relatively unknown quantity in the problem of manufacture and production.

# The United States Buys Much War Equipment in Dominion

*United States Contracts Expected to Continue on Large Scale—Production to Increase With More Fuel and Raw Materials—Steel Industry Prices to be Discussed at Washington—Markets Generally are Quiet and Firm.*

IF the development in the engineering industry during the past few months is any indication of what may be expected in the future, Canadian concerns will benefit considerably by the influx of orders from the United States. It is estimated that orders to the value of $50,000,000 have been placed in Canada by the United States during the past five months for munitions, marine engines and other war equipment. There is apparently no reason to doubt that this business will increase as the necessities of the situation arise. This business in addition to the contracts placed by the Imperial Munitions Board will in the aggregate represent a very large sum of money and add to the wealth of the country. Conditions in the iron and steel industry have improved on account of the more seasonable weather enabling supplies of fuel to be shipped in heavier volume to consumers. This will be reflected in an increase in production which will soon be normal. An effort will doubtless then be made to obtain larger supplies of raw materials so that the output of iron and steel may be further increased to meet the extraordinary and pressing demand for steel. Capacity output is assured for the steel plants for the remainder of this year. Prices are unchanged and the market is firm, although a decline in steel plate is expected shortly. The situation in the iron and steel trade in the United States is gradually improving and output is steadily increasing. The War Industries Board and leading producers will meet in conference next week to discuss the question of prices. It is understood that the producers are in favor of continuing the existing prices after March 31. The scrap metal market continues dull and unchanged with consumers buying on a hand-to-mouth basis to satisfy current requirements only. There is a scarcity of cast iron and heavy melting steel scrap. The export of scrap iron has been prohibited by the Government. Prices are unchanged. In the non-ferrous metal markets lead has advanced slightly on account of scarcity. The tin situation continues acute and prices are entirely nominal. The position of copper is unchanged as is also that of the other metals. Prices of solders have advanced, reflecting the high cost of tin. Prices of machine shop supplies continue firm with an upward tendency in some lines. Cotton duck belting and linseed oil have advanced, the market for the latter being particularly strong. The machine tool trade is still rather dull, enquiries being principally for munitions equipment.

MONTREAL, Que., March 11, 1918.—Steady progress has been made in the movement of freight upon the different railroads, although a temporary setback has been experienced due to the recent storm. The congestion at the terminals is less pronounced and a gradual return to normal is taking place. The steel problem is still one that is occupying the attention of both the Government and the producers here and in the States. Every effort is being made by the Canadian authorities to obtain all necessary requirements for the activities now under way, particularly those pertaining to the construction of steel vessels, negotiations having been successfully completed whereby an ample supply of plates will be available for those vessels that have been laid down by the Dominion Government. The possibility that some large shell contracts for the American Government may be placed in Canada has revived the interest of shell manufacturers, but developments in this direction are still in the negotiation stage. The general condition of the industrial situation promises a renewal of activity when more favorable weather is assured.

### Steel

Gradual improvement has become an encouraging factor in all branches of the steel and iron industry but some time must yet elapse before operations are of a normal character. The severe storm over the week end has temporarily renewed the difficulties under which the railroads are still working and the movement of freight has again been disorganized in some districts. Many of the blast furnaces in the States are still seriously affected by the inability to obtain sufficient coke to operate at capacity and consequently production remains below normal. Nothing definite has as yet been learned as to any revision of prices contemplated by the American Government in connection with the steel situation. Feeling is becoming general, particularly among the smaller producers of steel, that existing conditions warrant a higher selling price on semi-finished material, owing to the present high cost of production, which is considerably higher that at the time the Government regulations went into effect. With the prevailing heavy demand it is anticipated that some concession may be granted to producers to stimulate production of essential steel requirements. A developing feature of steel activity is the probability of the American Government standardizing of freight cars, which if put into effect would ultimately result in the corresponding regulation of prices for all car parts. The Canadian Government has recently purchased approximately 500 miles of rails, (through the United States Commission), that had been manufactured for the Russian Government. Owing to recent developments this material has been withheld from its initial purchasers, so that the negotiations just completed will enable the rails to be used in the very near future for the Government roads in Canada. The steel interests are awaiting any action on the part of the American Government regarding their attitude towards a revision of the regulations now in force respecting the prices of steel. Jobbers are looking forward to better recognition in the future. The requirements of Government contracts often necessitate the securing of steel on relatively short notice and the jobbers are invariably resorted to in obtaining this material. Co-operation in this connection is therefore essential and some steps should be taken whereby jobbers may be assured of equal consideration with other contractors working on a priority basis. This, however, is a feature of government control but nevertheless a factor in the better distribution of steel supplies, as under existing conditions the needs that might be classed as non-essentials are relatively very few. Local conditions are unchanged and dealers report a very quiet situation; delivery of materials is still acute as considerable difficulties still surround the transportation upon the various railroads. Prices are unchanged.

### Metals

Tin continues to be the dominating feature in the metal situation owing to the acute condition that has arisen through the inability to obtain sufficient metal to meet the trade requirements. The general metal market is steady in character although the difficulties contingent to transportation and production are still factors in the uncertainty of the market. Copper is in increasing demand owing to the heavier requirements of the American Government. Spelter has remained firm although the demand is light. Lead has again advanced but the

demand is falling off. Antimony and aluminum are both showing a weaker tendency.

**Copper.**—Despite the fact that the U.S. Government requirements for copper are steadily increasing, the supply is apparently ample to meet the growing needs. Some inconvenience is experienced by domestic consumers in obtaining supplies but this is to be expected in view of the abnormal developments in other directions. The open market is not very active and the trade seems to be waiting the outcome of negotiations that are contemplated for a revision of prices that are likely to be considered before the first of June. Many arguments are being advanced as to why the present price should be raised, the principal one being the marked advance in the cost of production over what it was when the regulation was put in force. The difficulties under which the refineries have been operating during the past six months have made it almost imperative that higher prices should prevail. A fair demand for copper is reported on the local market and the supplies are comparatively plentiful, the market is easier than last week and dealers are now quoting 30c for lake and electro, and 29c for casting, these prices representing a decline of 2c per lb.

**Tin.**—The tin situation continues to be the feature of the present metal market in view of the acute condition that surrounds the securing of metal from England and other points in the East. The London market continues to be in a very strong position and prices continue to advance. The inability to obtain sufficient metal for immediate requirements has placed the New York market in a very strong and likewise difficult position with nominal quotations the dominating factor in an unsettled and nervous market. Dealers here report that supplies in Canada are of fair volume considering existing conditions and the demand is very active, but dealers are guarded in the alloting of tin, being unable to foretell the trend of the early future. The market here has been rapidly climbing for the past several weeks and the century mark has almost been attained; the present nominal quotation of 98c shows an advance over last week of 8c per lb.

**Spelter.**—Difficulties surrounding the shipping of spelter has retained this metal in a relatively steady position, although the demand has not been exceptionally active. The New York market has shown a slight decline but the undertone is one of returning strength. The local situation has been rather quiet and dealers report an easier market with quotations lower. A decline of ½c per lb. places the present price at 11c per lb.

**Lead.**—The activity that was pronounced earlier in the week has fallen off and the demand has declined. The market is, however, still in a strong condition and the advance has been maintained. The quotations on the New York market indicate a strong position; trust prices show an advance of ¼c while the independent price has been advanced ⅜c during the week, the quotation of the latter being 7½c per lb. The local situation is a steady one and the demand is regular; dealers report no change in prices and are still quoting 10½c per lb.

**Antimony.**—The market for this metal has not been active and a light demand continues. The New York market is weaker with lower prices asked. Local dealers report a light but steady demand with prices holding firm at 18c per lb.

**Aluminum.**—The market is generally quiet with American prices declining. Local situation is unchanged with prices steady at 55c per lb.

### Machine Tools and Supplies

Present activity in the machine tool industry is not very brisk, owing largely to the fact that users of machinery are pretty well supplied for current requirements. While the demand for munition machinery has fallen off considerably there are still some scattered inquiries for individual tools of medium weight for the six inch shells. Some activity has been shown in forging equipment in connection with the manufacture of the 75 mm. shell, this resulting from the inability of firms doing the machining to obtain forgings in sufficient quantities for the capacity operation of their plants. Some little business has been done in heavy tools for shipyards, but on the whole the week has been comparatively quiet in all directions.

Post-war possibilities are apparently interesting a number of machinery men, as it has been reported that several machine tool interests are taking steps to improve the conditions under which machinery may be manufactured so as to enable better concentration along certain lines with the purpose of bettering the efficiency in connection with production. Some interest has been developing in the prospect that American orders for larger shells may come to Canada, in which event a renewal of activity may be expected in machinery circles. The demand for all classes of general supplies continues to be quite active and prices are invariably well maintained.

### Scrap

Nothing has developed to alter the general tone of the scrap situation and dealers are apparently waiting improved conditions on the railroads for increased activity and likewise better conditions. Consumers are not buying for future needs, only purchasing sufficient to cover their immediate requirements; the supposition being that any regulation that may be put into effect will lower the present prices, particularly on certain iron and steel scraps. In the Pittsburg district, the government has set a price of $35 on No. 1 cast (for cupola use) and a similar price on No. 1 wrought iron. These prices, however, represent a $5 advance over that ruling a couple of weeks ago on the open market. Steel scrap has shown a general tendency to become stronger in the States. The local situation has not been featured by any particular development and dealers report business comparatively quiet. Some little difficulty is still experienced in getting supplies from the source to the destination, but improvement is becoming more pronounced, although the recent snow has temporarily affected the movement upon the roads. Regarding prices, dealers here are uncertain and present quotations are nominal and unchanged.

**CANADIAN GOVERNMENT WAR PURCHASING COMMISSION**

**The following gentlemen constitute the new war Purchasing Commission. Sir George Foster, Minister of Trade and Commerce; Frank P. Jones, Montreal; J. W. McConnell, Montreal; James H. Gundy, Toronto; Charles McNaught, Toronto, and Joseph Gibbons, Toronto. C. A. Magrath, as Fuel Controller, and Hon. H. Laporte, as chairman of the War Purchasing Commission, are members of the board ex-officio. Sir George Foster is Chairman of the Board.**

## Toronto

TORONTO, Ont., March 12.—Developments during the past five months have been such as to further consolidate the engineering industry in this country. Orders from the United States have been placed during this period for munitions, marine engines and other war equipment to the value, it is estimated, of $50,000,000. Of this amount $35,000,000 have been placed by the Imperial Munitions Board, which includes the seven million 75-m.m. shells, two million cartridge cases and ten million forgings. These orders, while being of the greatest benefit to the engineering industry, will have an important influence in adjusting the balance of trade and equalizing exchange between Canada and the United States. The Imperial Munitions Board is also expending about $25,000,000 a month in Canada on behalf of the British Government. Such a large expenditure cannot help but have a very beneficial effect on the industry and on Canada as a whole. Indications point to this activity continuing for the remainder of the year. Plans have been completed for the supply of rails for the various railroad systems in Canada, which are badly in need of new tracks and replacements. The Dominion Government has placed a contract on 100,000 tons of rails with the Dominion Steel Corporation, to be rolled at Sydney. It is understood that rolling will begin on April 1st. During that month 10,000 tons will be produced, and it is expected that deliveries will reach 30,000

[illegible] month in May, June and July. The [illegible] May [illegible] probably 85 pounds.

### Iron and Steel

[illegible] situation in the iron and steel [illegible] continues to improve steadily and production is gradually increasing in volume. More reasonable weather is having [illegible] effect on trade, and the steel plants are able to obtain heavier supplies of fuel, which will be reflected in an increase in output and afford marked relief to the prevailing shortage of iron and steel. Production should soon reach normal tonnage, which will likely be succeeded by an effort to still further increase the output, as suggested some weeks ago. Arrangements are doubtless being made to secure sufficient supplies of raw materials to enable the required tonnage increase being produced. The intention is to have all steel plants in Canada operating at capacity this year in order to take care of the enormous demand for steel. This, however, will not be easy to accomplish owing to the shortage of lake tonnage, cars and labor, but doubtless the 1917 record will be beaten.

Locally the iron and steel trade has been rather quiet this week and deliveries are still backward. Traffic conditions, which were improving, received a temporary set back by the snowstorm on Saturday, which considerably hampered the movement of freight in some districts. The local strike of freight handlers has also aggravated an already difficult situation for the railways to cope with, and has also inconvenienced merchants and distributors. There have been no price changes this week, and the market is holding firm. The only change likely in the near future is in steel plates, which will probably be reduced in price about 1c a pound. Good progress is being made in this district on the new Government ships. There appears to be no difficulty in getting plates and shapes for these ships, as arrangements have been made with Washington to facilitate shipment of material for this purpose. Available supplies of pig iron are being quickly absorbed at current prices, which are holding firm. The demand for basic pig iron continues heavy, and there has recently been more inquiry for foundry grades.

The majority of the steel manufacturers in the United States are in favor of the present schedule of prices being continued until the end of the year, although some are agitating for higher prices on some products. It is quite possible that the War Industries Board will seek reductions in prices. The whole question will be considered at a conference between the board and the producers to be held next week. It is possible that existing prices will be ordered continued after March 31 for an indefinite period, but not to the end of the year. Prices do not constitute the sole concern of the steel industry by any means. The possibility of an insufficient demand to engage all capacity, in case transportation conditions permitted, was recognized long ago by a few observers, and is now being recognized more generally. The highest estimates of total war requirements of all descriptions run from 50 to 60 per cent. of the full productive capacity. Meanwhile with steadily, though slowly, improving traffic conditions, the production of steel increases, shipments of finished steel in the past week representing about 70 per cent. of capacity. This month is expected to show a more rapid increase, and thus bring to a decision the question whether there is to be a demand for all the steel industry can make. Unfilled orders of the United States Steel Corporation on Feb. 28 were 9,288,453 tons, according to the corporation's monthly statement recently issued. This is a decrease of 189,400 tons, compared with orders on Jan. 31

### Scrap Metals

Conditions in the scrap metal market are unchanged, and inquiries have been very light for some time. Dealers' stocks continue low, although it is believed that sellers are holding back in anticipation of higher prices. Consumers, on the other hand, look for lower prices, and are in the meantime only buying on a hand-to-mouth basis to satisfy current requirements. There is a scarcity of good cast iron scrap and also of heavy melting steel, which is keeping the market firm in these materials. All prices are unchanged. Export of scrap iron has been prohibited entirely by the Government with a view to conserving in Canada the limited supplies of iron and steel raw material easily convertible for manufacturing purposes. The United States prohibited export of scrap iron some time ago, and in view of the prevailing scarcity of supplies for the iron and steel trades in Canada it was found necessary to stop in Canada issuing further licenses permitting export of scrap iron to the States.

### Machine Tools

Another rather quiet week has been experienced in the machine tool trade and conditions in the market are unchanged from last week. The demand continues to be principally for munitions machinery with occasional enquiries for equipment for shipbuilding plants. It appears probable that further contracts will be placed in Canada, these will, it is reported, include shells up to 12-inch calbre. Tentative enquiries only have as yet been made as to the ability of the Canadian plants to produce a shell of this size, but it is not unlikely that ultimately some contracts will be placed. The market in the States is less active and deliveries will likely improve as a result.

### Supplies

Prices of machine shop and mill supplies continue steady and firm with an upward tendency in some lines. An advance of about 7½ per cent has gone into effect on "Maple Leaf" cotton duck belting, and the discount now in effect is 20 per cent. as against 25 per cent. formerly quoted. The demand for leather belting is good and a firm undertone is evident in the market. A strong undertone to the waste market is reported and that an advance is almost sure to be made effective in the near future has been gathered. In some quarters it is felt that present prices are too low. Stocks are reported to be in good shape and equal to heavy demands which may soon develop. At the present time, shipments are limited. Oakum held steady and no change is anticipated at the present time. Linseed oil has again advanced due to the short supply of flaxseed, the price now being $1.95 for raw and $1.98 for boiled oil.

### Non-Ferrous Metals

The situation in non-ferrous metals has become more interesting by reason of the uncertainty surrounding developments in the market, more particularly in regard to cotton, tin and aluminum. The revision of copper prices will come up for consideration some time in May and it is understood that the producers will induce the U.S. Government to agree to a higher price after June 1. There is no improvement in the position of tin, the scarcity still being acute with practically no supplies obtainable. Although the price of aluminum has been fixed in the States, there has been no change locally, a condition brought about by the scarcity of metal in this market. The price of lead has advanced because of the scarcity of metal in the East on account of the traffic congestion. Spelter and antimony are both unchanged, but solders have advanced. Business in Toronto and district is very good and the outlook continues favorable.

**Copper.**—There is no new development in the copper situation and the market continues very quiet. At the present time there is somewhat of a shortage in the United States due to a heavy and sudden demand by Government who cut off supplies from outside consumers for the time being. However, no fear is expressed that there will be an ultimate shortage of the red metal. It is reported that a movement is on foot among the producers to induce the U.S. Government to agree to a higher price after June 1. Lake, electrolytic and casting copper is still quoted at 28c per pound.

**Tin.**—There is no change in the position of tin which is very scarce. The entire situation seems to be growing more serious each day, and inquiries and demand for the metal far exceeds the ability of supply. The demand extends for deliveries far into the future. There is no Straits tin offering and only limited quantities of Banca and Chinese. In this market there is practically no spot tin to be had and the price is entirely nominal at $1 per pound.

**Spelter.**—The market has a weaker tendency on account of the light demand which is resulting in a decline in production. The price of spelter in London remains officially fixed at £54 for prompts and £50 for futures, which are equal to 11.45c and 10.60c per pound. The local price is unchanged at 11c per pound.

**Lead.**—The market locally is firmer, and the price of lead has advanced ½c per pound due to a scarcity in the East caused by shipments being delayed on account of traffic congestion. The undertone of the market is strong, but with in-

creased production as the season advances an easier position may be anticipated. Lead is now quoted locally at 9½c per pound.

**Antimony.**—There is no change in the antimony market, which is attracting little attention. Present price 17c per pound.

**Aluminum.**—Although the price of aluminum has been fixed at 32c per lb. in the primary market there has been no change made here due principally to the fact that very little metal can be obtained except for government work. The market here is firm and the price is still 52c per pound.

**Solders.**—The great scarcity of tin and consquent abnormal high prices has caused a further advance in the prices of solder. The advance is equivalent to 2c per pound, guaranteed being now quoted at 50c and strictly at 47c per pound.

# Washington

**Special to Canadian Machinery**

WASHINGTON, March 9. The war industries of United States are more closely knit together to-day than at any time since the entrance of that country into the war. Reorganization of the War Industries Board by President Wilson has completed the work of mobilization of the entire industrial resources of the nation to the work of winning the war.

Bernard Baruch has been appointed the new chairman of this important board, as was predicted in this letter last week. Under the new plan the board is given wider authority over the industries of the nation, and it is expected that it will be able to wield the same power that might have been placed in the hands of a Director of Munitions. The entire industry of the country is placed under the rule of Mr. Baruch by the executive act of the President. No legislative power has been given to the War Industries Board, but the executive powers of the President have been transferred to the War Industries Board in a large measure and through this control the industries are placed at the disposal of the government.

### Price Fixing

One of the most important steps taken by the United States government, and affecting the industries of both United States and Canada, is the step taken this week to secure absolute control over the steel industry of United States. Steps have been taken to fix the prices on all commodities which are included in the manufacture of steel. By so doing it is expected that the government will be able to control the entire steel output of United States and to absolutely fix the price on that important product.

The steel situation in United States has not been greatly improved, according to the reports received by officials here. There is still danger of a serious shortage. However, the new War Industries Board has plans under way which will limit the steel output of the country to war purposes, so that it is expected that if there is an acual steel shortage that it will not have any effect upon the war work of the nation, but will be confined to the non-essential industries of United States.

### The Price of Labor

One of the factors in the steel industry in the country which is giving officials no little worry is that of wages. There have been enormous increases in wages which are steadily driving the prices upwards. Reports to the Labor Department show that during the past year increases in wages in the steel industry have ranged from 52 per cent. to 95 per cent. This is one of the reasons for the attempt to fix the prices on all commodities entering into the manufacture of steel, as the officials believe that by holding down the prices of these commodities they can wipe out some of the increased labor costs and keep the price of steel on a level.

### Canada is Favored

The War Trade Board has placed an effective embargo on all exports of tin plate from United States. Canada is exempted from this embargo, however. Although other countries are partially exempted, Canadian manufacturers are the only ones placed in the same class with those of United States, and are unrestricted in their purchases of tin plate in United States.

The United States government has taken over the platinum industry of United States. An order has been issued commandeering all supplies of raw platinum. This order, however, does not affect those manufacturers who are using platinum in the manufacture of anything that may be considered a war necessity.

The price of aluminum has been fixed by agreement with the producers of this product at 32 cents a pound.

### Tenders Are Called

The Navy Department has announced that it will make call shortly for a number of die sinking machines, and for a miscellaneous assortment of hardware. Manufacturers desiring to offer bids on these products should write to the Bureau of Supplies, Navy Department, Washington, D.C., asking for schedules 1721, 1719, 1707 and 1711, 1712. The hardware specifications call for a large number of valves of various descriptions.

### More Labor Trouble

The shipping situation in the United States is again threatened by labor trouble. The Hog Island yard, which up to this time has been free from labor trouble, is now struggling with a strike of some three hundred men because the government officials in charge of the work there have seen fit to cut down the overtime pay for Sundays and holidays from double time to time and a half. The ship carpenter controversy on the Atlantic coast is still going on, although a greater part of the workers have returned to their work and have subjected their demands to arbitration.

### Ship Construction

The Navy Department has announced that tests are now under way of a non-sinkable ship. Work has been going on for some time on the construction of this vessel, which is built on the idea of a double hull. The ship is now at sea, and will undergo numerous tests before a final decision has been reached.

The first of the submarine destroyers being built at the Ford automobile plant in Detroit will be ready for a trial trip in the early summer, according to official announcement from the Navy Department.

Coal and transportation conditions in United States have again reached a state which is almost normal, according to announcements from the Fuel Administration and the office of the Director General of Transportation.

# New York

**Special to Canadian Machinery**

NEW YORK, March 9.—Some large contracts for machinery are understood to have been tentatively placed by the government at Washington in the last few days, and additional contracts are pending. The prospect is that manufacturers of machine tools and of other shop equipment will find employment for full capacity throughout the current year and well into 1919 unless there is a sudden halt in the war. Ordnance makers as well as manufacturers of shells that are preparing to build new plants, as well as to extend works now in operation, must come into the market for all kinds of machine tools and coveying machinery as soon as government contracts have been placed.

### Big Development Here

The Quartermaster's Department of the Army is understood to have closed contracts for equipment of machine shops in this country and in France. Buying of this character for 1918 and for 1919 requirements will be three times the orders placed for 1917 delivery, according to reports from Washington. The local office of the United States Signal Corps has put out an inquiry for 30 small lathes, 10 sensitive drills and other tools for the equipment of shops that will manufacture spark plugs for aviation motors. The New England Westinghouse Co., of Springfield, Mass., has been given a large contract for Browning machine guns which, according to reports current in the trade, will aggregate $12,000,000. Substantial supplementary orders for the same type of guns have also been given to the Remington Arms, U M C Co., the Winchester Repeating Arms Co. and the Marlin-Rockwell Corp., which concerns have been making Browning guns. The Remington Arms Co. has already placed orders for additional shop equipment calling for the expenditure of $100,000 and the other companies are

expected to make similar purchases in the near future.

### More Big Orders

The Dominion Shipbuilding Co. has given a contract for 4,000 tons of structural steel to the Central States Bridge Co., and another contract for 1,000 tons of steel to the Nashville Bridge Co., for the construction of powder plants at Charleston, West Virginia. The same interests are also understood to have placed orders for machinery for these shops. Additional powder plants will be built for government, calling for about 18,000 tons of shapes, specifications for which are now in course of preparation. The Dupont Engineering Co., Wilmington, Del., has bought $75,000 worth of tools for the works at this point. The Dupont Co. will also build and equip shell-making and shell-loading plants at Williamsburg, Virginia, if present plans are carried out. The J. G. White Engineering Co., New York, has issued a list of tools required by the Government for equipping plants in France to manufacture airplane motors and the Pennsylvania R. R. has continued to buy jib cranes for motor hoists to be installed in railroad shops in France. Total purchases will be 336 cranes.

Official announcement has been made at Washington of the ordnance base now being constructed in France at a cost of $25,000,000, but most of the details of this enterprise were reported several months ago. The machine tool equipment has cost about $5,000,000.

It is estimated that the Savage Arms Corp. Utica, N.Y., has contracted for several hundred tools valued at $1,000,000. One order called for 150 tools and another for 100 tools all of which will be used in the manufacture of Lewis machine guns for aircraft.

The Ford Motor Co. has placed a contract with the American Bridge Co. for 4,000 tons of structural steel required in the building of a boat shop 1,700 feet long. The building is to be completed about May 10th. The submarine destroyers will be built in this shop. The Worthington Pump & Machinery Corp., which is to make the pumps for these boats, has purchased tools for its Harrison, New Jersey, shops. The Terry Steam Turbine Co. will make 400 turbines to operate the pumps.

## Pittsburg

Special to Canadian Machinery

PITTSBURGH, Pa., March 9.—As for two or three months past, the crux of the situation is how fast can finished steel be shipped from mills, mill operations depending upon what the mills can ship, while the production of pig iron, although greatly restricted, nevertheless furnishes an ample supply for the steel that can be shipped.

Shipments, on the whole, have increased in the past week, but only slightly. A fair estimate for the industry as a whole is that in the past week the shipments have been equal to [illegible] of capacity, against an average of between 60 and 65 per cent. in February and 55 to 60 per cent. in January. Conditions are quite irregular and inconsistent, however. For instance, a particularly heavy snowfall the first week in January so tied up the Chicago district mills that they shipped hardly anything in the month. Again, while early in February traffic conditions were equally bad in the Pittsburgh and Youngstown district, about the middle of the month a great improvement occurred in the Youngstown district, whereas in the past two or three weeks it has been shipping at a much better rate than the immediate Pittsburgh district. Furthermore, as preference is given to war material, the shipments of war steel, directly and indirectly required by the Government, are very much heavier than the shipments of ordinary commercial steel. Then there are differences among the various branches of the trade. The pipe mills are shipping at better than 75 per cent. of capacity. The independent sheet mills are averaging close to 80 per cent., while the leading interest's sheet mills have hardly averaged over 40 per cent., and so it goes.

### Price Revision or Extension

It is the more common opinion that the War Industries Board will extend the present set prices after March 31, though perhaps not to the end of the year, as the producers desire. While a good bit gets into the public prints about the present set prices being unjust in one respect or another to certain producers, there is little likelihood that any prices will be advanced. Some of the arguments, moreover, will not hold a great deal of water. It is true, doubtless, that the present price for plates, 3.25c, does not afford much margin to the plate mill that must operate on slabs purchased at $50, but the argument that the price should be advanced to 3.75c "to stimulate production" meets with the pertinent observation that possibly the production of plates does not need to be stimulated, that quite possibly a supply of plates equal to 75 or 80 per cent. of the present capacity will provide all the plates the shipyards and car shops can turn into ships and cars respectively, and still leave a respectable overflow for commercial demand, which demand is at present conspicuous by its absence. A ten to twelve-cent plate market last summer had much to do with throttling such demand.

What is distinctly possible is that if the present set prices are continued there will develop shortly in some lines an open competitive market. Producers themselves are quite alive to that possibility, though naturally they do not discuss it openly.

Attention should be directed to the fact that the War Industries Board has, in essence, a great deal more power than it had last September, when it brought about the voluntary agreement by producers that prices should be set to apply to the Government, its Allies, and the domestic buyers generally. The Government had clear legal authority to fix prices only upon the first class of material named, and that was only a relatively small proportion of the total steel being shipped. Now Government steel is by far the preponderating tonnage, and if the Government were to release the producers from the agreement and fall back upon its power to fix prices upon its own purchases, say, at cost plus a certain percentage, the producers might find themselves in a decidedly uncomfortable position. There is no thought of any such thing. The control of the War Industries Board is simply regarded as complete, and no one has a desire to raise any question.

### Demand for Sheets and Pipe

While the finished steel market as a whole is very quiet as regards ordinary commercial demand, there are some high spots. The demand for tubular goods used in the oil industry continues very insistent, with deliveries difficult to obtain, and there is quite a fair demand for standard steel pipe from distributors, who, while they may not expect as heavy a distribution this spring as usual, have been unable to accumulate stocks during the winter as they usually do.

The commercial demand for sheets is also good and early deliveries are very difficult to arrange, the mills apparently being quite well filled for the next two or three months at the rate at which they are now able to operate. Prices in the domestic market are firm at the set maximum levels, 4.25c for blue annealed, 5.00c for black, and 6.25c for galvanized, but there are cases of mills paying a small commission to large distributing interests.

### Coke and Pig Iron

Since the improvement early in February the shipments of Connellsville have not increased to speak of, and are running at only about 300,000 tons a week, whereas it is safe to estimate the blast furnaces depending upon the Connellsville region for their coke require about 375,000 tons a week. There is also some shortage of by-product coke owing to slight deficiencies in supplies of by-product coal, while beehive districts other than Connellsville are not making their full quotas of coke. Assuming a slight increase in pig iron production over the average in February, the country is now making pig iron at the rate of about 33,000,000 tons a year when the capacity is fully 43,000,000 tons. The 10,000,000 tons deficiency is coke, and apparently nothing else. Perhaps with a full supply of coke other difficulties might be uncovered, but they are not apparent now.

### Transportation and Rolling Stock

The only visible influence curtailing the production of pig iron and steel is the lack of sufficient transportation for the coke from coke ovens to blast furnaces, or coal from mine to by-product coke ovens, for intermediate products and for finished rolled steel from mills. Shipments of finished steel, as indicated already, may be estimated at about 70 per cent. of capacity, while the capacity is fully 35,000,000 gross tons a year, or about 3,000,000 tons a month. It does not follow that if the industry could ship at 100 per cent. there would be a continued demand for the increased amount of material.

# SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

## PIG IRON

## ENGINEERING

**Moose Jaw, Sask.**—The C. P. R. contemplates the erection of a 400-ton capacity mechanical coaling plant here.

**Galt, Ont.**—Work on the new machine shop for the Canada Machinery Corporation Co. is progressing rapidly despite the weather. The 25-ton electric crane, which will run the length of the new building, is now in place. Before long the roof of the building will be on.

**Port Moody, B.C.**—The Aetna Iron and Steel Co. are installing a six-ton electric furnace which will be in operation about the middle of this month. The material used will be scrap iron, and the product will consist of merchant bars, light angles and channels. The company is operating the mill on scrap faggots to make rods for shipbuilding purposes.

**Ottawa, Ont.**—Plans are being made by the Railway Department for a further increase in the rolling stock and equipment of the Government railway system, including the Canadian Northern. In addition to the heavy purchases made last year, it is proposed to buy one hundred and fifty new locomotives, and 7,500 box cars this year, to be utilized in taking care of the anticipated increase in traffic.

**London, Ont.**—The Public Utilities' Commission has directed to the Dominion Natural Gas Co. a request for full particulars concerning the strike of gas in a well near Port Talbot, thirty miles from London. The company is reported to have found gas there 70 miles from any other known field. The strike was made at a depth of 1,506 feet, and the yield is now estimated at from 5,000,000 to 7,000,000 feet a day. London will ask for a supply in order to be able to meet the coal shortage next winter.

**Montreal, Que.**—J. M. Hutcheson, general manager of Montreal Tramways Co., states that the second auxiliary steam plant at Hochelaga, consisting of a steam turbine with a capacity of 12,500 k.w.h., or about 17,000 h.p., will be installed towards the end of April or at the beginning of May. Asked as to how the first auxiliary plant was working out, Mr. Hutcheson replied that it was doing very well, being used in rush hours, such as in the morning and evening, when requirements for electric current are far above normal, besides which it can be used in case of any failure of transmission of hydraulic power.

## ELECTRICAL

**Calgary, Alta.**—The City Commissioners are in the market for a motor generator set.

**Chatham, Ont.**—The Dominion Sugar Co. has asked the Hydro Commission for 2,900 h.p. for the operation of a part of their plant using what is known as the Barium process, by which it is now possible to manufacture sugar from refuse formerly regarded as almost impossible.

**Toronto, Ont.**—The Ontario Legislature has voted over $9,000,000 for Hydro-Electric extensions, of which $4,175,000 is for carrying on work on the great Chippawa development at Niagara Falls, from which the province will ultimately secure a minimum of 250,000 additional horse-power.

## GENERAL

**Winnipeg, Man.**—A deal is being put through whereby the Harris Abattoir Co. will purchase the Gordon, Ironsides & Fares Co.

**Georgetown, Ont.**—The woollen mills owned by H. Corke & Co. were burned to the ground on Monday morning. The company had been working on yarn and was supplying various manufacturers, filling Government orders. The loss, including building and contents, is estimated at about $50,000.

**Tillsonburg, Ont.**—Fire on March 6 almost completely destroyed the main building of the Huntley Manufacturing Co. Its origin is a mystery, and the amount of the loss will probably amount to at least $50,000 on the building, exclusive of machinery, tools and new machines ready for shipment. The main factory of the Huntley Co., which is engaged in the manufacture of elevator machinery, is situated in Silver Creek, N.Y. The Canadian company purchased the plant of the Tillsonburg Electric Car Co. a year ago.

## MUNICIPAL

**Melfort, Sask.**—Town Council contemplates the purchase of a Diesel oil engine.

**Port Dover, Ont.**—The gas franchise by-law was carried here by 210 for and 10 against.

**Fredericton, N.B.**—The city council are considering calling for tenders for pumps for the waterworks.

**Chatham, Ont.**—The city council contemplate undertaking extensive improvement to the waterworks system.

**Verdun, Que.**—Tenders will be called this year for repairs and reinforcements to waterworks and electric plants at a cost of $50,000 for the town council.

**Alliston, Ont.**—The Town Council has decided to purchase a 20 h.p. triplex plunger pump and electric motor at a cost of $2,800. W. J. Cunningham is chairman of the committee which has the matter in hand.

**London, Ont.**—The ice pressure of last month has forced a hole 20 feet wide in the foundations of the waterworks dam at Springbank, which prevents further development of power from this source. Five hundred horse-power was developed there and used for power-load correction and during the present shortage. It will be months before the necessary repairs can be made.

## TENDERS

**Ottawa, Ont.**—Tenders will be received until March 21 for motor street flusher for the Department of Works.

**Montreal, Que.**—Tenders will be received up to Tuesday, March 19, 1918, for steel rails and angle bars, castings, oils, timber and ties, smokeless coal, steam coal. Copies of the specifications and tender forms may be obtained upon application to F. W. Cowie, Chief Engineer.

**Winnipeg, Man.**—Tenders for structural steel ornamental lamp posts for the Provencher Ave. Bridge, addressed to J. B. Cote, secretary of the Joint Committee, St. Boniface, will be opened on March 28. Plans and specifications to be obtained from the Bridge Engineer, 802 Confederation Life Building.

**Ottawa, Ont.**—Tenders will be received until Tuesday, April 2, 1918, for the construction of a Dominion Government Office Building, O'Connor street, Ottawa, Ont. Plans and forms of contract can be seen and specifications and forms of tender obtained at the offices of the Chief Architect, Department of Public Works, Ottawa; the Overseer of Dominion Bldgs., Central Postoffice, Montreal, and the Clerk of Works, Postal Station "F," Toronto, Ont.

**Ottawa, Ont.**—Tender will be received until Monday, March 18, 1918, for the construction of structural steel work, Dominion Government Office Building, Ottawa. Plans and forms of contract can be seen and specifications and forms of tender obtained at the offices of the Chief Architect Department of Public Works, Ottawa, the Overseer of Dominion Buildings, Central Post-Office, Montreal, P.Q., and the Clerk of Works, Postal Station "F," Toronto, Ont.

**Melbourne, Australia.** — Tenders for the following may be addressed to the Director of Navy Contracts, Navy Office, Melbourne: Supply, delivery and erection at Garden Island, of one (1) 200 horse-power prime mover set of either semi-Diesel type or other heavy oil engine direct coupled to 2-65 K.W. 240 volt D.C. electric generating set. All accessories, tank and fittings to be supplied by tenders as per specification. Date of closing, June 7, 1918. Tender forms are open for inspection at the Department of Trade and Commerce, Ottawa. File No. 20117.

**Ottawa, Ont.**—Tenders will be received until March 25, 1918, for the switchboard, panel boards and transformers

required in the reconstruction of the Parliament Buildings. All tenders to be based on the execution, completion, and delivery on the site, together with the furnishing of all material, tools, appliances, labor, etc., for the work as required and described by the plans and specifications for switchboards, panel boards and transformers. Plans and specifications and any other information required can be obtained at the office of the general contractor, P. Lyall and Sons Construction Co., Ottawa.

**Ottawa, Ont.**—Tenders will be received until Tuesday, March 26, 1918, for the construction of fifty-one (51) section houses at various points on the Canadian Government railways (National Transcontinental Railway) between Moncton and Winnipeg. Plans, specifications and blank form of contract may be seen at the following offices: Chief Engineer, Dept. of Railways and Canals, Ottawa, Ont.; Chief Engineer, Can. Govt. Rys., Moncton, N.B.; Resident Engineers at Edmundston, N.B., Levis, P.Q., Quebec, P.Q., Cochrane, Ont., Fort William, Ont., the Terminal Agent, Montreal, P.Q., the General Western Agent, Toronto, Ont., and the General Manager Western Lines, Winnipeg, Man.

**Ottawa, Ont.**—Tenders will be received until March 18, 1918, for rolled steel casements and bronze-covered frames and sash for the Parliament Buildings. All tenders to be based on the execution, erection and completion; together with the furnishing of all materials, tools, appliances, labor, etc., as required and described by the plans and specifications for (a) rolled steel casement; (b) bronze covered frames and sash. Separate tenders to be submitted for "a" and "b." The work included under this contract shall be commenced immediately on the signing of the same, or at such time as may be directed, and be carried out in such a manner as to insure the completion thereof by Sept. 30, 1918.

**Ottawa, Ont.**—Tenders will be received until March 18, 1918, for heating and ventilating equipment required in the reconstruction of the Parliament Buildings. All tenders to be based on the execution, erection, and completion, together with the furnishing of all materials, tools, appliances, scaffolding, apparatus and labor required for the installation of the heating and ventilating equipment as called for in the plans and specifications. All information can be obtained at the office of the general contractors, P. Lyall & Sons Construction Co., Ottawa. A set of plans and specifications may be had by depositing an accepted bank cheque for twenty-five ($25.00) dollars, made payable to the Honorable the Minister of Public Works, which will be re- ing bidder submits

## INCORPORATIONS

The Galt Foundries Co. been incorporated at Toronto with a capital of in iron Galt

**Ont.** The provisional directors are B. Colvin, D. Buchanan and W. E. Demill, all of Galt.

**The Acme Waste Mfg Co.** has been incorporated at Toronto with a capital of $40,000 to carry on the business of rag pullers and waste manufacturers at Toronto. The provisional directors are W. P. Ford, I. M. S. and H. Goldstein all of Toronto.

**The Buckeye Traction Ditcher Co.**, incorporated in Ohio, has been granted permission to manufacture iron, steel, machinery, tractors, implements, etc., in Ontario, with a capital stock of $50,000. John J. Wallace, Chatham, Ont., represents the company

**Leonard Tractor Co. of Canada, Ltd.**, has been incorporated at Ottawa with a capital of $1,000,000 to manufacture tractors, motor trucks, etc. The head office is at Montreal and the incorporators are W. W. Skinner, W. G. Pugsley and G. G. Hyde, al of Montreal.

**The Electric Insulation and Varnish Co.** has been incorporated at Toronto with a capital of $60,000 to manufacture varnished cambrics and other products for insulation purposes in connection with all kinds of electrical machinery and apparatus. The provisional directors are John Whitfield, T. G. Shaw, and J. Montgomery, all of Toronto.

## RAILWAYS

**Ottawa, Ont.**—Work on the Quebec and Saguenay Railway will be resumed very shortly.

**Ottawa, Ont.** The acute scarcity of 80-pound steel rails in Canada to meet railway requirements for replacing worn rails has led to an arrangement between the Federal Government and the Government of New Brunswick for the purchase of over 100 miles of new rails on the St. John Valley Railway, now Provincially owned.

**Ottawa, Ont.**—It is being suggested at the City Hall that if the city is to provide accommodation for foot traffic across the Rideau Canal between Ottawa East and Centre Town in the vicinity of the old Ottawa East Bridge, this accommodation should take the form of a tunnel instead of a foot bridge. It is asserted that with bridge materials at present prices a tunnel would cost less than a bridge.

**Ottawa, Ont.**—Plans are being made by the Railway Department for a further increase in the rolling stock and equipment of the Government railway system, including the Canadian Northern. In addition to the heavy purchases made last year it is proposed to buy 150 new locomotives and 7,500 box cars this year, to be utilized in taking care of the anticipated increase in traffic.

**Ottawa, Ont.**—It is estimated that new rails are required this year for some 2,000 miles of Canadian railways, improvements being long overdue because of the difficulties of the past three years in regard to securing rails, money and labor during war time. The arrangement which has been made in regard to new rails on the Intercolonial emphasizes the difficulties of the railway companies in meeting pressing requirements of keeping roadbeds up to standard.

## MARINE

**Victoria, B.C.**—It is understood that the Dominion Government will give $50,000 towards the construction of the shed required on pier No. 2 at the new outer wharves.

**Montreal, Que.**—It has become known that interests headed by James Playfair, of Midland, were bidding for the purchase of the Northern Navigation Co.'s passenger service on the Great Lakes, reports stating that $2,000,000 had been offered to the Canada Steamship Lines as owners of the Northern Navigation Co.

**Vancouver, B.C.**—The auxiliary schooner Stasia has left Vancouver bound for Kobe and Yokohama, carrying 500,000 feet of lumber and a shipment of steel. She will complete cargo at Victoria. The Stasia was the twelfth and last of the fleet of British Columbia-built schooners and was launched in November under the name of the Beatrice Castle, but was recently sold to French interests. She loaded at the Evans, Coleman & Evans docks.

**Vancouver, B.C.**—J. H. Price, president of the Cameron-Genoa Mills Shipbuilders, operating a four-way shipyard at Point Ellice, has been entrusted with the designing of two types of sailing craft, one of 3,000 tons and another of 3,500 tons register, for Charles Towne, of Buenos Aires, Argentina. These vessels will be similar in design to the five-mast power schooners designed and built for the Canada West Coast Navigation Co., but considerably larger. These ships will be of the windjammer class and consequently will rely solely on sails for driving power.

**Victoria, B.C.**—The arrival of British officers to take over the first two wooden steamers of the war emergency fleet again brings to the fore the question of manning the ships with full complements as they are turned over to the owners by the builders. Capt. Norman C. King and Capt. R. M. Milestone, of the Fernie Line, accompanied by four mates and eight engineers, have reached the city from Liverpool, and are now standing by the vessels to which they will be assigned, the War Yukon and the War Nootka, the most advanced of the twenty-seven steamers under construction on this coast for the Imperial authorities.

## PERSONAL

**G. G. Bushby**, of Vancouver, has been elected president of the British Columbia Manufacturers' Association.

**Hon. W. J. Hanna** has been appointed president of the Imperial Oil Co., with headquarters in Toronto. Mr. Hanna succeeds W. C. Teagle.

**Captain Robert Fraser**, who for over twelve years was marine superintendent of the Montreal Transportation o., at Kingston, ont. died at Long Beach, Cal., on Sunday.

MARSH ENGINEERING WORKS,
LIMITED
(Formerly Marsh & Henthorn, Limited)
NOTE NEW NAME
BELLEVILLE - - ONTARIO

C. J. Hicks [illegible] the Dunlop Mfg. Co. of Toronto. Mr. Hicks came from Midland, Ont., and previous to his work [illegible] had wide experience in manufacturing work.

**William M. Brouse**, a prominent business man of Brockville, Ont., will move to Orillia having been appointed assistant manager of the International Harvester Co., there.

**R. S. Carter**, district representative of The Whitman & Barnes Mfg. Co., with headquarters in Pittsburgh, has been promoted to sales manager and will have direction of twist drill and reamer sales from the Akron O., general office.

**Adam Cook**, the senior member of the firm of Adam Cook's Sons, manufacturers of Albany Grease, died on Feb. 19, at his residence, 148 West 78th street, New York City. Adam Cook was born in Albany, N.Y., in 1867.

**H. E. Fisher**, formerly with The Pittsburgh Model Engine Co., Pittsburgh, Pa., has become associated with The Whitman & Barnes Mfg. Co., Akron, O. He succeeds R. S. Carter as mechanical engineer and will have charge of sales in the Pittsburgh district.

**W. A. Jamieson** has been elected chairman of the Victoria branch of the B.C. Canadian Manufacturers' Association. Mr. Jamieson thus becomes vice-president of the British Columbia organization, the headquarters of which is in Vancouver.

**Paul E. Thomas** of Chicago, prominent for years in railroad circles in the traffic department of the Seaboard Air Lines, has become connected with The Whitman & Barnes Mfg. Co., Akron, O. His official position is that of sales manager in charge of the department of wrenches and spring cotters.

**R. A. Gurnham**, who has been connected with the John McDougall Caledonia Iron Works for the past seven years, the last two as works superintendent, has accepted a position as mechanical engineer with Darling Bros., Montreal. He will be associated with the sales department.

**Loyall A. Osborne**, of New York, vice-president of the Westinghouse Electric & Mfg. Co., and chairman of the executive committee of the National Industrial Conference Board, has been appointed by the Secretary of Labor a member of a committee on industrial peace during the war.

**A. B. Hall**, vice-president of The Whitman & Barnes Mfg Co., will have supervision of the company's sales. He has for the past twenty-one years been connected with the company in various sales and official capacities. His early connections were with the company's Chicago sales office as manager, which position he held until his transfer to the general office at Akron, O.

R. W. Gladstone, manager of the Canada Ingot Iron Co., at Guelph, Ont., has been at the plant of the parent company at Middletown, Ohio, recently. At the U.S. mills there are stocks piled up [illegible]

particularly fortunate in securing its supply of raw material, the thickness used being a shade under that which would be necessary for military purposes. Even now none of the output can be exported until all the orders that are claimed by the War Department have been filled and satisfied.

**Thomas A. Russell**, vice-president of the Willys-Overland Co., and of the Russell Motor Car Co., has been elected president of the Canadian National Exhibition, Toronto. Mr. Russell was born at Exeter, Ont., in 1877, and graduated from Toronto University in 1899. He was secretary of the Canadian Manufacturers' Association in 1900-02. He was one of the pioneers of the automobile trade in Canada, and in 1908 was president of the Ontario Motor League. In 1911 he became general manager of the Canada Cycle and Motor Co., and later vice-president of the Willys-Overland Co.

# TRADE GOSSIP

**February Fire Losses.**—The "Monetary Times'" estimate of Canada's fire loss during February is $2,243,762, compared with the January loss of $2,688,556 and $2,009,953 for February, 1917.

**Civil Engineers to Merge.**—A Committee of the Nova Scotia Society of Engineers has adopted a resolution favoring an amalgamation with the Canadian Society of Civil Engineers. It has been unanimously decided to make application to the Council of the Canadian Society for the formation of a branch in Halifax.

**Greater Production in B.C. Coal Mines.**—An increase of ten per cent. in the output of coal in British Columba was shown in January, according to returns made by the various operating companies to the Department of Mines. The total tonnage (long tons) in January, was 230,755, compared with 197,636 in January, 1917. The production, according to districts, was as follows:

**Price For Aluminum Fixed by President.**—A maximum base price of 32c a pound for aluminum at the various American plants and their subsidiaries has been fixed by President Wilson. The price is subject to revision on June 1, and covers lots of 50 tons and over of ingots of a 98 to 99 per cent. grade. The price was fixed after investigation by the Federal Trade Commission, and an agreement by the War Industries Board with the producers.

**Canadian Steel Plants Expect Large Contracts.**—That all steel plants in Canada will probably be operating at full capacity throughout the year under heavy demand, and that large new munitions contracts are expected from the United States and Great Britain, are opinions expressed by Colonel Thomas Cantley, chairman of the board of directors, Nova Scotia Steel & Coal Co.

**Tin Plate Available for Canada.**—The War Trade Board of Canada has been successful, it is understood, in making an arrangement with the War Trade Board of the United States whereby the fruit, vegetable and fish canners of Canada will be enabled to obtain supplies of tin plate from the United States at a price which will approximate to the price of $7.75 per base box of 300 pounds now paid by American canners.

**Large U.S. Contracts Placed in Canada.**—Orders for munitions, marine engines and other supplies for war purposes to an estimated value of fifty million dollars have been placed by the United States in Canada during the past five months. Of the total orders to the amount of thirty-five millions have been placed by the Imperial Munitions Board. The latter mentioned orders include contracts for seven million shells, two million cartridge cases and ten million forgings.

**Increase Freight Rates From U. S. to Canada.**—Following the recent 15 per cent. increase of class and commodity rates in Canada, the Interstate Commerce Commission on Sunday formally authorized a proportional increase in rates from points in the United States to Canada on the leading railroads. The lines affected directly are the Grand Trunk, Minneapolis, St. Paul & Sault Ste. Marie, Great Northern, Canadian Northern, Canadian Pacific, and Duluth, Winnipeg & Pacific.

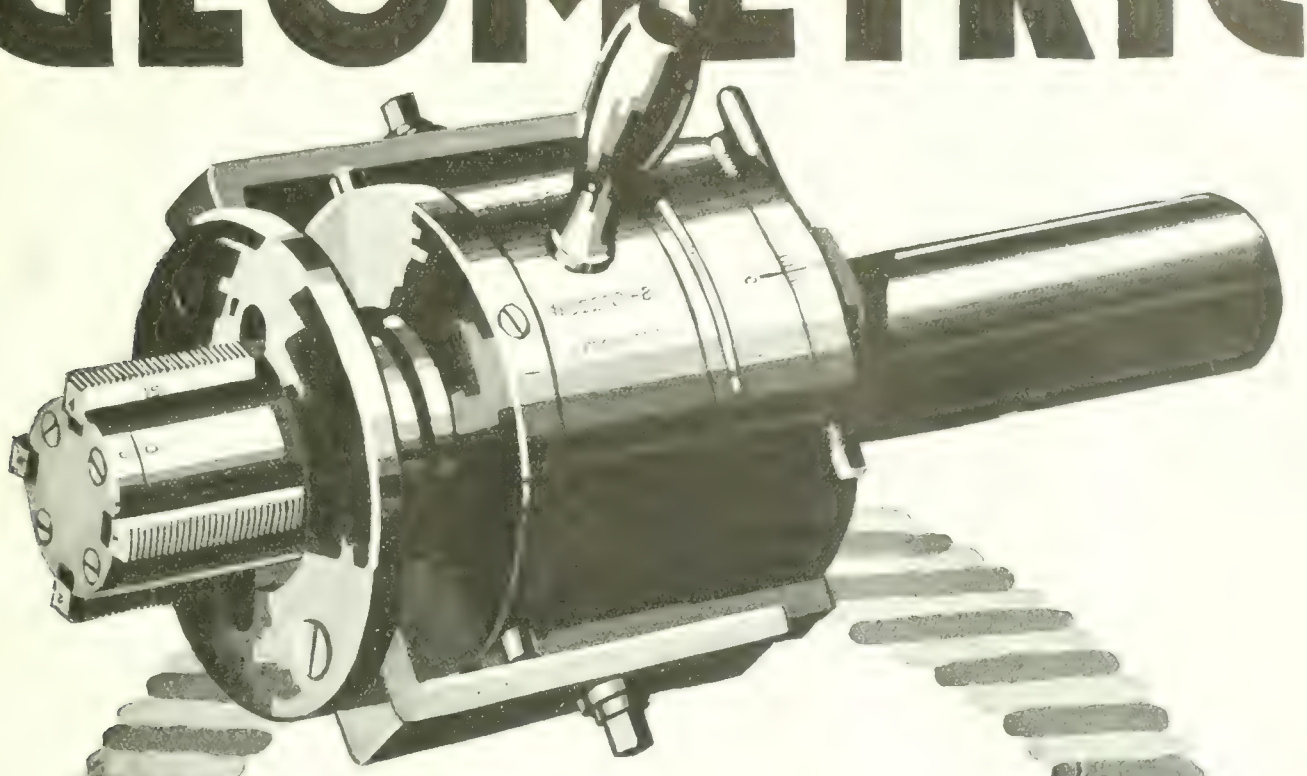
**Scrap Iron Export Prohibited.**—Export of scrap iron has been prohibited entirely by the Dominion Government with a view to conserving in Canada the limited supplies of iron and steel raw material easily convertible for manufacturing purposes. The United States prohibited export of scrap iron some time ago, and in view of the prevailing scarcity of supplies for the iron and steel trades in Canada it was found necessary to stop in Canada issuing further licenses permitting export of scrap iron to the States.

Practically all raw materials necessary to Canadian manufacture in essential industries re now on the prohibited list of exports, except on procuring of special license therefor from the War Trade Board.

**Steel Companies' Loss Through Fuel Shortage.**—It is estimated that the steel companies in the United States have lost between $100,000,000 and $150,000,000 because of the compulsory cutting down of production in January, due to lack of fuel and to freight congestion. Additional losses have been sustained through the production of off-quality of steel arising from the use of high sulphur coal and poor coke. Because of these developments the productive costs of steel have advanced enormously and some of the smaller companies are actively agitating the question of more remunerative prices from the Government.

**Aluminum Price Fixed by War Industries Board.**—A price of 32 cents per pound has been fixed on aluminum by the War Industries Board acting with President Wilson. The figure applies to all lots of 50 tons and over of ingot of a grade of 98 to 99 per cent., the existing trade differentials for other grades being continued. The new price holds for all business done up to June 1 next, when provision is made for revision if neces-

# GEOMETRIC



## The Tap Famous For Good Work

Geometric Collapsing Taps share the popularity of Geometric Die Heads. They have the same good reputation for tapping inside threads that the Die Heads have for cutting outside threads. All objections of a solid tap are overcome in the Geometric Collapsing Tap. They are as rigid as solid taps while cutting, but collapse the chasers automatically when the required depth of thread has been cut. Are adaptable to Screw Machine, Turret Lathe or Live Spindle. Made in sizes suited to any diameter above ¾-inch in straight threads or standard pipe thread sizes.

**Write for the Geometric Collapsing Tap Booklet.**

sary. In announcing the price several provisions were made for dealers, one being that the same price must be maintained to all, whether Government Allies or public.

**To Consider Plans for Export Traffic.**—To consider the outlook for export traffic and to lay plans for the handling of the same to Atlantic seaports, representatives of railway and inland navigation companies met in Ottawa early this week. The conference has been called by the Prime Minister at the suggestion of Hon. C. C. Ballantyne, Minister of Marine. Information will be obtained from the railway and steamship men as to the facilities for moving to Montreal, Quebec, Halifax and St. John, N.B., freight intended for shipment overseas. An effort will be made to bring about close co-operation between the transportation companies in the use of those facilities.

**Want Prices of Steel Advanced.**—The American Iron and Steel Institute has been getting ready for March 31, when the present schedule of prices of iron and steel expire. It is understood that the trade will oppose a lower schedule and that many small manufacturers, pleading the higher cost of materials and labor, will seek higher prices. Judge Gary explained that the meeting was held "for the purpose of examining the cost sheets of manufacturers and for the discussion of the relatives or differential prices heretofore in force, in order intelligently to present to the War Industries Board the facts necessary to a determination of future prices."

**Ice Conditions on the Lakes.**—The first ice report showing conditions on the Great Lakes, as compiled by the Weather Bureau, Detroit, Mich., and the regular display stations of the Meteorological Service of Canada, indicates that the ice field over Western Lake Superior extends, solid, East from Duluth for more than thirty miles, with some open water East of Grand Marais. From Keweenaw Point East to Whitefish Bay, fields are extensive and heavily windrowed over the East portion. The ice averages from 22 to 26 inches. In comparison with the ten-year average there is about eight inches more ice at Duluth, seven inches at Sault Ste. Marie, twelve inches at Mackinaw, and seven inches at Escanaba.

**To Fix Prices on Raw Materials for Steel.**—A despatch from Washington states that the steel manufacturers have asked the Government to fix prices on all products entering into the manufacture of steel, in order that the fixed price for steel may be stabilized.

The steel manufacturers urged that it was inconsistent to set a price for the finished products without at the same time controlling prices of products entering into its manufacture. Raw materials of which steel is made already have come under Government control, but accessories have not. Chrome, refractory brick, crucibles and all materials entering into the construction of blast furnaces will be affected.

**Engineers Will Discuss Fuel Problem.**—Because of the great public interest in fuel and power, the Canadian Society of

Civil Engineers has called a public session for March 26 and 27 at the University of Toronto, Physics Building, to discuss coal, wood, peat, gas and electricity, as related to coal and kindred problems. Arthur Hewitt will speak on "Gas," B. F. Haanel on "Peat and Natural Resources," Prof. Zavitz on "Wood," and Sir Geo. Bury on "Transportation," John Murphy on "Railway Electrification," P. H. Mitchell on "Electric Heat." Premier Hearst has been asked to preside, and invitations have been sent to the Provincial Government, the City Council, the Board of Trade, and the Canadian Manufacturers' Association

**Will Confer on Steel Prices.**—The American Iron and Steel Institute's special Committee on Steel and Steel Products, headed by E. H. Gary, is scheduled to confer with the War Industries Board at Washington on Wednesday of next week. The meeting promises to be memorable, as related to the question of fixed prices for steel and measures to be evolved for speeding up production. The committee will be empowered to speak for all the steel manufacturers in the country, it is understood. As a means for stimulating production, it is expected that the committee will present data in behalf of many steel makers intended to show that prices for certain lines, particularly plates and other material used in shipbuilding, should be increased.

**Government Place Large Order for Rails.**—An order for 100,000 tons of steel rails, or enough to lay tracks on some 800 miles of railroad, has been placed by Hon. J. L. Reid, Minister of Railways, on behalf of the Government, with the Dominion Iron and Steel Co. The rails are to be manufactured at Sydney, C.B., and all are to be delivered by the end of July next. Rolling will begin on April 1 and it is hoped that during April 10,000 tons can be ready for use in making replacements on Canadian railways. In May, June and July it is expected that the rail mill will be working up to its full capacity, and that deliveries will reach 30,000 tons a month. The rails will be heavy ones, probably 85 pounds to the yard, and will be suitable for renewals on railway main lines.

**Copper Refineries May Have to Close.**—A crisis appears to have been reached in the copper industry, and the opinion is general that the United States Government will have to raise the price of the metal, which has been pegged at 23½c for the past year. The copper refining companies have delivered an ultimatum to the copper producing companies stating that unless the latter pay an increased charge for the handling of their produce the refineries will have to shut down. Executive committees of the various refining companies have held sessions recently and the situation is so critical that it was deemed best to acquaint the producing companies with the real facts, accompanied with a demand that the refining charge be increased. It is expected that the copper mining companies will agree to the additional expense.

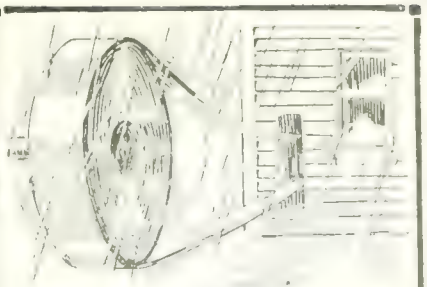
Where Do You Place Your Outside Work?
Are you hemmed in for planing room?
Do you need help to prevent steel metal work?
Can you keep up on your blacksmith shop?
Are you getting enough gray iron castings?
Let us help you
Canadian Rumely Co., Limited
48 ABELL ST., TORONTO



LANCO BALATA BELTING

It is really waterproof belt, not merely waterproofed.

The Balata Gum is applied in a solution and impregnates all the fibres of the duck. Every ply of this belt is waterproof even after the surface is worn off. This is required in a belt subject to wet conditions

Federal Engineering Company Limited
172 John Street, Toronto

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers.
We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.
We can finish steel stamping in Nickel, Brass or Copper.
Send us a sample order.

W. H. BANFIELD & SONS
372 Pape Avenue, Toronto, Can.

# Business Problems During the War and After

JUDGE ELBERT H GARY, clerk in a general store, student of law, and head of the United States Steel Corporation, warns business men.

"It is probable that the Russian Revolution and its consequences were planned in Germany, and have been financed and directed by German money and brains. Germany is now endeavoring to 'Russianize' several other countries."

**LABOR IS IMPORTANT**

Above is one of Judge Gary's warnings. Another refers to labor-power for production of food and munitions of war. Another calls business men to organize for efficiency. The whole article is head and shoulders above average 'war-business' articles because Judge Gary is head and shoulders above even his peers in big business.

**IN THE FINANCIAL POST**

You can get the business value out of this powerful article to-day, for it appears in THE FINANCIAL POST for this week. Some one you know subscribes for THE FINANCIAL POST. Think of the most efficient friend you have. 'Phone him and ask him for a loan of his copy.

**OTHER CONTENTS TO NOTE**

Besides Judge Gary's article in this week's FINANCIAL POST, look for these headings. There's worth-while business news for you in every one of these items:

Outlook for Trade in Russia after War.

Sir Robert Borden and Luxury Imports.

Ontario Guarantees Loans to Farmers.

The Future of the Grand Trunk and C.P.R.

The "Muddling Along" Policy with the War.

The Making of a Mail Order King

Canadian Car Co. Had Big Profits.

Larger Profits for Dominion Canners.

These articles and many others on current business affairs appear in THE FINANCIAL POST of date March 9th. To read THE FINANCIAL POST this week and every week is to place yourself head and shoulders higher in business information than the rank and file whose news comes to them haphazard. THE FINANCIAL POST has a staff of expert editors with representatives in every important centre. The Editors of the strong group of THE MACLEAN BUSINESS NEWSPAPERS all add their intensified practical knowledge of the different business fields each week to the news columns of THE FINANCIAL POST.

Sign this coupon. Send it, and secure POST service.

The MacLean Publishing Co.,
153 University Ave., Toronto.

Send me THE FINANCIAL POST each week till further ordered. I will send subscription price ($3.00 per year) on receipt of bill, or you may draw on me for this.

Send me sample copy of THE FINANCIAL POST (current issue). Cross out if not required.

Repairs to iron and steel-making units, shortage of iron ore, lean ore, coal shortage, high water and railroad conditions are the chief factors affecting steel-making conditions in United States, and still holding output below normal. Reports on operations for the week ended March 2, however, show general improvement as compared with conditions prevailing a week earlier. Further improvement is expected during the coming weeks. Last week the Youngstown district coke ovens produced 92 per cent. of capacity, operating on the same basis as the previous week. Blast furnace operations were on an 88 per cent. basis, compared with 80 per cent. the week before, while open hearth operations were 86 per cent. compared with 81 per cent., and Bessemer operations 75 per cent., a slight reduction from the previous week owing to extensive repairs at one plant.

**Steel and Iron Manufacturers Organize.**—The metal interests held a separate meeting in the Windsor Hotel, Montreal, on Thursday, and decided to to organize a steel and iron section of the Canadian Mining Institute. An organizing committee was named which will start work at once. The members are as follows: Robert Hobson, Hamilton, Ont.; Col. Thos. Cantley, Mark Workman, W. C. Franz, Dr. Alfred Stansfield, W. J. Jannsen, H. M. Jacquays, J. A. Irwin, C. F. Bristol, Esmond Peck, G. H. Duggan and P. L. Miller, Montreal; J. J. Hartley, Kingston; F. H. MacDougall, Sydney, N.S.; F. H. Crockard, New Glasgow, N.S.; Geo. W. Watts and Wm. Inglis, Toronto; J. G. Morrow, F. A. Sherman and W. M. Curry, Hamilton, Ont.; Col. David Carnegie, Ottawa; Capt. David Kyle, Sault Ste. Marie; M. Deakin, Winnipeg; Fleet Robertson, Vancouver; Geo. McKenzie.

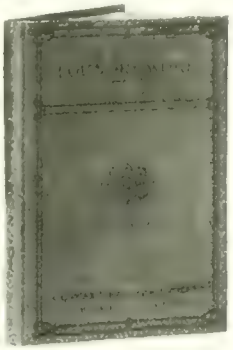
**White Sewing Machine Co. Development.**—"Our aim now is to increase the output of machines to one hundred per day," said Mr. Hedley, manager of the White Sewing Machine Co. of Canada to CANADIAN MACHINERY. "That is the reason for the extension which we now plan to make to our Guelph factory. It will be in the form of a third story on a building 250 x 40 feet. It will be used mostly for the woodworking departments. We will not be in the market for any new equipment on account of the extension." When the White Co. took over the business from the Raymond Co. twenty-five machines per day was the usual accomplishment of the factory. Since then the system of working has gradually been changed to conform largely with that used by the White Co. of Cleveland, and the result has been an increase in output, until at the present time sixty finished machines per day are being turned out. Mr. Hedley intimated that his company was preparing to enter the export field on a greater scale than ever. An organization is being built up to attend to the business abroad, this work being carried on in Australia especially just now, and considerable success is being met. Orders from France are also coming in under the heading of new business for this Canadian concern.

# Mechanical Engineering Books

**If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.**

**MACHINE-SHOP WORK.** By **Frederick W. Turner,** Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price **$1.50**

**MECHANICAL DRAWING.** By **Ervin Kenison, S.B.,** Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price **$1.00**

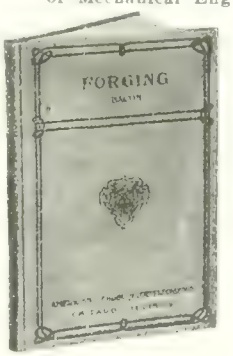


**FOUNDRY WORK.** Revised by Burton L. Gray, instructor in Foundry Practice, Worcester Polytechnic Institute. 224 pp., 191 illus. Cloth binding. A practical handbook on standard foundry practice, including hand and machine molding, cast iron, malleable iron, steel and brass casting, foundry management, etc. Includes use of various types of molding machines. Price, **$1.00**

**PATTERN MAKING.** By **James Ritchey,** Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price **$1.00**

**MACHINE DESIGN** By **Charles L. Griffin, S.B.,** Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price **$1.50**

**TOOL MAKING.** By **Edward R. Markham,** Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels—annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds; counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price ...**$1.50**



**FORGING.** By **John Lord Bacon,** Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price .....**$1.00**

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

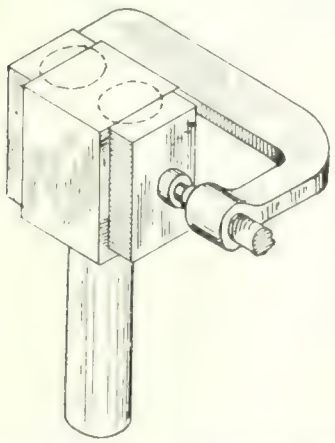
# Press Work Operations in Hospital Equipment Production

By D. A. Hampson

*Operations possessing marked features of economy, adaptability and lack of intricacy in the finished product are characteristic of the work described. The factors of labor cost, quantity production, necessary degree of accuracy, and cost of dies are related to each other in a manner which must receive careful consideration if successful results are to be obtained.*

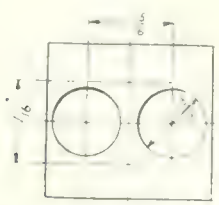
A GREAT many stays or ties are used on beds that are made from flat iron bars ⅛ in. to ¼ in. thick and ¾ in. to 1¼ in. wide. To make a more finished, mechanical job of these the ends are rounded in a punch press, using the punch and die shown. This outfit cuts the piece from the bar and rounds two corners at the same time. Formerly it was the practice to punch the holes in the centre of the round at the same operation, but this practice has been discontinued, because it was found to be more expensive to change for various sizes of holes and the tool upkeep was greater than when the holes were punched in a smaller press that was kept just for round hole work.

No special feature is noticeable about the die. It is held in the bolster by two set screws, which are ample and furnish a ready means of changing for other



SHOWING METHOD OF DRILLING HOLES THAT OVER-RUN THE BLANK

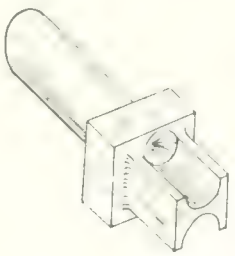
sizes. The punch is worked out of a solid piece of tool steel. First, the shank is turned and the cutting end faced off for the lay-out. On the smaller punches the



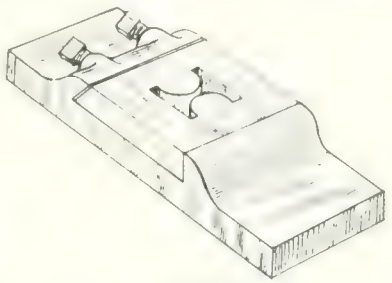
END OF PUNCH AFTER DRILLING NOTE THAT [illegible] IN CURVE IS USED FOR ⅝ IN. STOCK.

bar of steel is large enough to include the holes which are drilled and which form the round sides of the punch. On the larger punches pieces of steel are clamped to the sides, where the drill would otherwise break out and run off, and by so doing parallel holes are produced. This set-up is shown in the drawing. The space between the two circles is made greater for the larger sizes of bar iron. After drilling, the punches are milled to size. The sides are left parallel, and this permits the punch to be ground all the way down without any change in the work produced.

THE END TO BE FORMED



THE PUNCH.

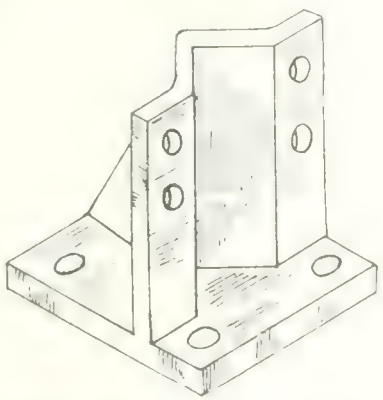


THE DIE

### A Special Angle Plate

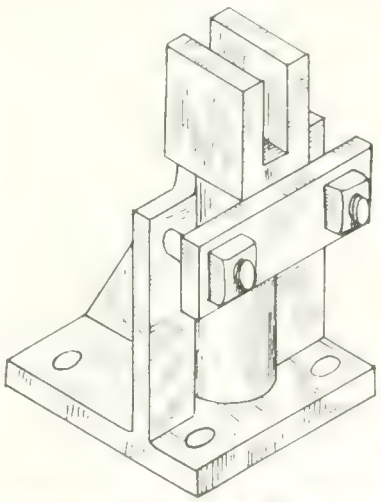
The drilling of the end holes is greatly facilitated by use of the V-angle plate shown. In fact, this fixture has become almost indispensable about the shop, not only on punch and die work, but for a great variety of other work where a round piece has to be held in an upright position for machining operations. A punch with a deep slot is shown; this would have been difficult to hold for such a cut without a similar fixture. Punches which have to be machined in the lathe and have a projection of considerable length are more rigidly held by this angle plate than by a chuck because the support is nearer the cut—often it is used in connection with the chuck.

Rods of ⅜-in. and ½-in. iron are used extensively in building beds, cots, stands, etc., and quite a few of these are required with the ends square tapered as



ANGLE PLATE FOR DRILLING ENDS OF PUNCH

shown. This work is done on the press. The die for the job is detailed. It has two stations, one for punching the first two sides and the other for punching the final two sides. A rod can then be finished at the one handling; as a matter of fact, with a little practice the press hand completes a rod at one stroke of the punch by taking a piece in each hand,



SHOWING ANGLE PLATE IN USE ON MILLING MACHINE.

working them progressively from the pile on his left to that on his right.

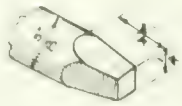
The punch is made from soft steel, with two inserts. The insert for the first cut is merely a pusher it never reaches the face of the die. The second insert is shaped to match with the tapered end left by the first operation.

Reference to the die will show that the opening for a ⅜-in. rod is made 7/16 in.; this is done to prevent any time lost in prying out a stuck rod. The face of the die is lowered for the second cut, and is so shaped that the tapered end has a full bearing when the rod is horizontal; a spring assists in maintaining this position before the ram descends. Suitable guides are provided and a stop does for both stations. This outfit produces a cheap square-tapered end without bend-

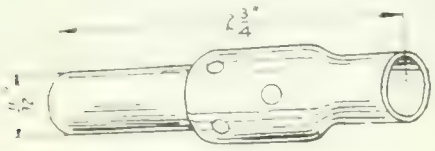
ing the rod. The work was such that the rods are pushed up until pulled, following that they are upset up and the taper ends formed by milling and chipping.

A factory's specialty made in the shop has as one of its parts the piece of thin brass tubing with an enlarged centre as shown. Several holes are required through the expanded part; these holes are not accurate as to size or position—they are in the nature of breather holes—and a method of punching has been adopted that is cheaper than drilling. A small bench punch is used. Because of the narrowed ends the die is necessarily reduced to permit the tube to be slipped over and this reduction does not add anything to the strength of the die. Worse, the hole for the punchings comes just where the section should be strongest, but isn't. To stiffen this part the punch is hardened and drawn to a blue. This temper holds up on the brass work very nicely, and when the edge gets dull the piece is thrown away. The keen edge and bevelled shape of the punch help to lessen the strain on the die.

PUNCH SHOWN INVERTED.



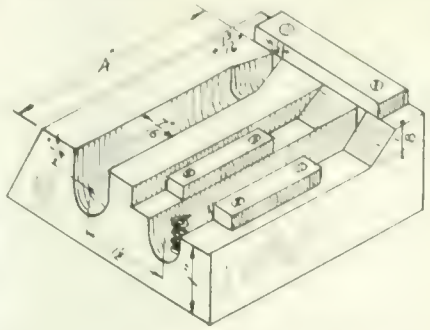
THE WORK.



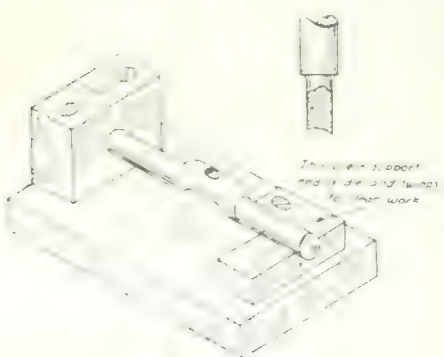
THE WORK.

### Punching Cast Iron

On a folding operating table there were several places where a nice fit was required in castings for the sliding of a ½-in. C.D.S. rod. Cored holes were too rough, filing was too slow and uncertain, and drilled holes were too expensive for the quantity of pieces in the lot. So a construction was adopted that permitted the punching of the holes; not punched from the solid, but punched to exact size from the cast hole. The casting was depressed on both sides, leaving the minimum amount of length of hole to finish that was permissible. Plenty of draft on each side not only made the foundry work easier, but made the punching operation a simpler one.

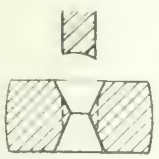


DIE FOR SQUARE RODS.



DIE AND HOLDER.

No die was needed. The castings were laid on the bolster on either flat side, located within an eighth of an inch by a V-shaped guide. When the punch descended the tapered hole centred the casting automatically. The shape of the punch end was as concave as the strength of the steel would stand; this had a tendency to gather the metal toward the centre of the hole and offset almost entirely any splitting of the castings. The resulting hole was clean cut, round and very quickly produced. The bevel on the under side had the same effect that filing off the edge of a casting on the planer does, i.e., to prevent chipping out as the tool passes over. An aid to the complete success of the process was the thorough pickling and tumbling that the castings received before coming into the shop.



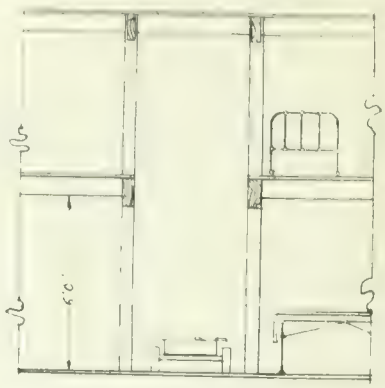
METHOD OF PUNCHING CAST IRON.

PUNCHING GLASS.

Two other points of interest in the factory are worthy of mention, though neither has to do with press work.

### Punching Glass

A non-refillable bottle for disinfectants was a patented article among the products of the plant. A section through the bottom of the bottle is shown. Without knowing the ins and outs of the glass bottle business, let it be said that the glass men could not or would not put the hole on the bottom—said there must be a continuous wall of glass there of some thickness. The plan we hit upon was to mould a depression on the under side, leaving the inside flat and of relatively thick wall except in the centre where the depression arose. This was agreeable to the glass blowers. When the bottles were received we put a boy to work knocking the thin part out. With the bottle resting on a cushioned fixture, he used a steel rod and a hammer and knocked out the centre portion. This was done from the "inside out," and was possible this way because of the clear nature of the glass, which enabled him to see the spot so readily. The breakages were few and the results, over having to cut the hole in some other way, were quite acceptable. An emery stick run at a high rate of speed was used to smooth off the edge of the hole left ragged by the punching.



ARRANGEMENT OF STORAGE SPACE.

### Unique Storage System

A storage system, somewhat unique, was in vogue. The drawing will make this clear. Instead of the usual height of ceiling, there was a space of just six feet from floor to beams and the "second floor" was but a little above that. Then instead of an elevator or stairway the second floor opened out into the aisles. From this height a man below could place goods on the second floor, or he could take them as handed down to him. This scheme required none of the usual lugging and handling of most storage rooms. Two men would be sent in any case for second floor goods and, with the six-foot arrangement, the handling time was very little. The value of the main floor storage space was in nowise curtailed, for greater head room would have only been waste space, it being well-nigh impossible to stack such enamelled goods in two tiers without damage to the finish.

## SEARCHING FOR BURIED SHELLS

AS an example of the uses to which abstract science may be put the application of the induction balance to the finding of unexploded shells on the battlefields of Europe is of more than passing interest.

In the early days of the Hughes' induction balance the hope was expressed that the balance would aid in the prospecting for certain magnetic ores and would also aid the surgeon in the probing for iron and steel objects embedded in the flesh.

The Génie Civil of November 10 gives

a description of a portable induction balance used for spotting live shells.

The problem was simply to devise a suitable portable instrument which would function properly, and at the same time would be easily carried.

The instrument consists of a pair of primary and secondary coils, so combined with a telephone and a "hummer" or vibrator that, when the one primary comes near a mass of iron, a sound is heard in the telephone, whilst the telephone will remain silent when the two primary circuits are exactly in the same condition. As the symmetry will rarely be perfect, a regulator is added to the instrument by means of which balance is established each time before use. The two pairs of coils are wound on two wooden discs, C and C', 60 cm. in diameter; the I and I' are the two primaries which, in the application of the instrument, are lying flat on the ground, and S and S' are the two secondaries; the distance between the centres of the two discs is 1.5 m., about 5 ft. The jointed arms with which the coils are connected in the way the diagram shows are made of wood; at the apex is the wooden handle, of which the observer takes hold; the main weight of the instrument is, however, taken up by a strap which is carried over the shoulder. The regulating device mentioned is mounted at the apex. It consists of two small concentric coils; the outer one is inserted in the primary circuit; the inner coil, in the

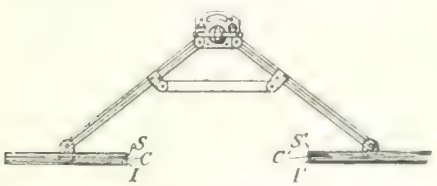


DIAGRAM OF INDUCTION BALANCE USED FOR SHELL FINDING.

secondary circuit, can be turned, and the angle between the two coils can thus be varied between 0 deg. and 90 deg. The vibrator and the induction coil and battery of three cells which actuate the vibrator are placed in a box which is carried by the observer's assistant; a flexible conductor joints the two parts of the instrument. The weight of the instrument is not mentioned. In conducting his search the observer, followed by his assistant, walks over the ground, keeping the flat coils as near the ground as is advisable and listens in the telephone, having previously tuned the regulator to silence. It is stated that a shell of about 10 kg. weight is easily discovered by this test if buried to a depth of 40 cm. or 50 cm.; a hand bomb would betray itself if buried to a depth of 30 cm. The maximum depth stated is only 20 in., which is not much. Fortunately the plow and spade of the farmer rarely approach this depth, and as live shells are dangerous objects this device should prove very useful.

It is said that experiments are proceeding for enlarging the range of the instrument, and improvements may be expected. It must be borne in mind, however, that the balance is a differential instrument, and that with greater depths and greater masses of iron, the differential effect on the two coils would be diminished; the coils and their distance apart would thus have to be enlarged, and the portability of the instrument would suffer. On the other hand, live shells are dangerous objects, especially to the farmer. Fortunately, his plough and spade do not, as a rule, go deep down into the earth.

## AMERICAN BATTLE PLANES EN ROUTE TO FRENCH FRONT

THE following statement is authorized by the Secretary of War in order to give as complete a picture as is permissible under military requirements of the problems and the progress in equipping the air service with fighting planes.

The first American-built battle planes are to-day en route to the front in France. This first shipment, though in itself not large, marks the final overcoming of many difficulties met in building up this new and intricate industry.

### Equipped With Liberty Motor

These planes are equipped with the first Liberty motor from machine production. One of them in a recent test surpassed all records for speed and climbing for planes of that type. Engine production, which began a month ago, is now on a quantity basis and the peak of production will be reached in a few weeks. Only the 12-cylinder type is being made, as developments abroad have made it wise to concentrate on the high-powered engine instead of the 8-cylinder.

These statements should not be exaggerated, but should be considered in the light of the following facts: After three years of warfare the total number of planes able to take the air at any one time on either side of the western front has not been over 2,500. This, combined with the fact that 46 men are required on the ground for every plane in the air, gives a truer perspective of the European aviation situation than commonly possessed.

### Replacement Planes

For every plane in the air there must be two replacement planes on the ground, and one training plane for every pilot who eventually reaches the front, with a spare engine for each plane. Moreover, while the American programme has been delayed by difficulties which were impossible to foresee when the tentative programme was adopted in all our lack of knowledge last spring, it may be said that American planes are not due in France under the original schedule until July.

At the outbreak of war the first step, both in sequence and importance, was to build up an industry to rush out the training planes needed for the prospective aviators who were immediately on hand. This fresh and most promising personnel afforded indeed America's largest immediate source of aid to her associate nations in the war, which, while well able to turn out the latest type of airplanes, were seriously drained of men capable of manning them. The ultimate goal, however, was the construction of a large fleet of battle planes.

Two serious problems, interwoven and reacting, were immediately met, the almost total lack both of airplane industry and of airplane engineering knowledge. The industry was rudimentary, with only one company on an appreciable production basis and another dozen small experimental companies. The metal work was mostly done by hand, each machine built as a separate unit and little attempt made to manufacture from dies, jigs, or gauges. The estimates of the total value of the industry vary from $2,000,000 to $10,000,000 and of employees from 5,000 to 10,000. The Government was practically the only purchaser, having ordered 366 planes the year before the war, of which only 66 were actually delivered.

### Difficulties in Europe

The engineering problems were even more complex. Europe, at war, with the best engineers of each country pitted against each other in a struggle which knew no close, had worked out the most ingenious developments in the light of actual fighting experience. Information reaching here was generally fragmentary and always late. As a result, when war came, the United States had practically no airplane engineering staff and no modern fighting planes.

Construction of planes presented a much more complex problem than that of engines, which had been developed and produced here for other purposes on a colossal scale. The extreme refinement of their manufacture, requiring 23,000 screws in a single fighter, or 700 pieces of wood in a single wing, necessitated the most expert workmanship and balance to secure the essential combination of lightness with strength, and seemed to militate against quantity production.

### Securing Information

The first step was to secure information from Europe. A commission was early sent across and rushed back the last-minute details, upon the strength of which a large number of fighting planes of a certain type were ordered. The raw materials were very largely in hand and the drawings within several days of completion when another cable said that this type had been superseded and should not be built. Nearly a month was thus lost.

Drawings then came for another type. They had just been redrawn for American manufacture and the die makers put to work when a second and different set arrived. The work done had to be cast aside and the process begun over again. Just as it was nearing completion still a third set of drawings arrived, and a third start was necessary. The unavoidable loss of time was preferred to turning out a design known at the outset to be out of date.

The effect of separation from the battlefields by 3,000 miles is further shown in that anywhere from 17 days to 11 weeks have been required to secure various important samples from abroad. Another three weeks of day and night work is necessary to reduce these samples

to drawings for American manufacture. It is significant of the rapid development of the art of aviation that not a single type of the original schedule has survived into the present programme.

During the past month, however, a responsive channel of communication with the Allies has been opened, the latest types adapted to American manufacture, the industry increased at least twenty-fold, the training plane problem solved, and the production of battle planes begun. It is still very necessary, however, to view America's effort in aviation against the true perspective, both in this country and in Europe.

### Need for Skilled Men

The great problem now remaining is to secure the thousands of skilled mechanics, enginemen, motor repair men, wood and metal workers, etc., needed to keep the planes always in perfect condition. This great engineering and mechanical force at the airdromes, the flying fields, and the repair depots, both here and behind the lines in France, is a vital industrial link in the chain to air supremacy. Without them the planes turned out would soon be useless and the flyers helpless.

At best the life of a plane is but two months, and the engine must be overhauled after 75 hours, while a pilot on a plane allowed to leave the hangars in imperfect condition is as helpless as a bird with a broken wing. Now that American battle planes are going overseas, a great increase in the volunteering of skilled mechanics is both essential and expected.

## MORE EFFICIENT MECHANICS

NO mechanic will ever attain to a high state of proficiency if he neglects to acquire and retain those rudiments of arithmetic that are necessary essentials to a more thorough understanding of the elementary fundamentals of mechanical engineering. Too many workmen of to-day are apparently content with the limited knowledge required to do the actual operations of cutting metal to bring the piece of material to the specified shape and dimensions. Without the application of mathemetics the study of engineering would be virtually impossible, and without fair knowledge of the first principles of arithmetic, even the simplest mechanical operations would be very difficult to perform. Many men fail to realize the advisability of acquiring the technical or theoretical details of mechanics for the better accomplishment of shop problems. The fact that a boy has only been able to obtain a limited public school education should not deter him from aspiring to a more thorough knowledge pertaining to the theoretical science upon which his practical work is

It is probably true that modern methods of manufacture very often eliminate the necessity on the part of the workman to use the learning of their younger days in the production of the work upon which they are engaged. This [illegible] accepted and likewise recognized by every workman as one that will gradually place the machine tool operator in a position relatively the same as any other part of the machine that he is called upon to serve. The actual thinging and planning of his duties is becoming a problem in the solution of which the workman has little to do, owing to the efficiency methods (so called) that are constantly being adopted in mechanical industries. These systems, however, unless operated on a comprehensive, co-operative basis, must eventually crush the individual initiative in factory employees, so that their tasks become more a question of observation and application than the concentration of reasoning powers for successful achievement. It is therefore obvious that, if a workman aspires to higher positions, where his brain will relieve the hands and the labors of former days, he must acquire the knowledge that will enable him to apply these potential but often dormant faculties.

Many young men, and also those who are not young, refrain from the study of technical journals or handbooks because of the general use of formulae in such text books, believing that a comprehensive knowledge of algebra is required before these formulae can be solved. A brief study of a formula will demonstrate to the average mechanic that the only requirement is a well grounded learning in the elementary principles of arithmetic and patient application of these fundamental rules in order to solve the problem. Of course, there are many formulae that require a wider knowledge of mathematics than that possessed by ordinary mechanics, but the persistent study and practice of working out the more simpler problems will gradually develop the reasoning powers to such an extent that eventually the difficult questions will not appear so formidable as first supposed.

To achieve, one must continue to strive, as the prize is invariably given to the winner, and in these days of rapid progress and development no man can hope to succeed and at the same time be content to sit still and let the boat drift with the tide. Seldom does the current flow in the right direction, and, in order to reach a haven where the going requires less effort, it is necessary to get out the oars and pull against the stream, and the harder you pull the sooner you will be in a position to watch the others as they drift indifferently or struggle to free themselves from undesirable, but oftentimes unavoidable environment. Too many men to-day are wasting their time and energies in commenting on the other fellow's job, a factor that cannot but detract from the ability to do justice to their own. Those men who are continually envying the other fellow and his "soft job" will rarely ever find themselves in a similar position, as with few exceptions, these so-called soft jobs are the result of previous concentration to less responsible, but none the less important, details. Therefore it is imperative, and also quite obvious, that the ambitious young mechanic who hopes for greater remuneration or more responsible position must use every means to fit himself for the wider duties that call for a thorough knowledge of the work upon which he is temporarily engaged, together with the deeper technical understanding that is essential for the successful filling of the job higher up.

## RESEARCH WORK IN GLASS

WITH the aid which the British Government is extending to research work, and the formation of a Department of Technichal Optics, Great Britain is undoubtedly about to play an important part in the future production of scientific optical glasses. Perhaps in no other industry has the change and development due to the war been so unexpected. Scientific thinking is now the order of the day, and this is being directly exercised in the surveys of roads of commerce. A great improvement is taking place in respect to the output of optical instruments and spectacle ware. German firms, subsidized by their government, and French firms did most of the business in opthalmic glasses and lenses before the war.

When hostilities broke out the shortage of optical glasses became a pressing matter for England, and it was necessary for the Government to subsidize at least one large firm to supply the army with field glasses. Other firms have been encouraged to meet the demand, with the result that the hand work of the past has been superseded by machinery, which, after the war, will be available for a large export trade. Steps have now been taken to establish systematic education and research for the industries of optical glasses and instrument mak-

A fund of £1,000,000 has been placed at the disposal of the committee of the Privy Council for scientific and industrial research, from which grants will be made to trade research associations for the next five years at least. To the Department of Technical Optics, recently established at the Imperial College of Science and Technology, London, £1,000 a year for five years has been allocated, together with a grant of £750 for special apparatus. The college provides laboratory accommodation with an equipment grant of £2,000. The London County Council has contributed £1,000 a year for maintenance, with a special capital sum of £2,500 for alterations and equipment, whilst optical instrument makers in London have provided apparatus worth about £1,000.

Professor Cheshire of the Patent Office and the Ministry of Munitions, is director of the new Institute of Technical Optics. The Society of Glass Technologists has also been established, and Professor Herbert Jackson, F.R.S., has been investigating the position of certain optical glasses for the Government department with the assistance of the glass research committee of the Institute of Chemistry. He has succeeded in defining the composition of the batch mixtures necessary for the production of glasses hitherto manufactured exclusively in Jena, and amongst other things he has discovered three completely new glasses with properties hitherto unobtainable.

# Some Considerations Regarding Modern Plant Organization-II

By M. H. Potter

*The factors which enter into the successful manufacturing process of to-day are dependent to an ever increasing degree. Location of plant, factory organization, staff organization and plant equipment are features which require to be considered both singly and as a whole in relation to the particular product to be manufactured. [illegible] idea of such considerations is necessary to [illegible] manufacturer.*

THE duties of an up-to-date purchasing agent are quite difficult and should not be looked upon lightly, for, in addition to his being an administrative officer, he remains the man of details. Details are paramount for the department's success for one to keep a hand on the pulse of the entire organization; and those who entertain hopes of becoming identified at some future time with this particular field may be assured that hard work and conscientious endeavor are vitally necessary. The work, however, is interesting and pleasant, and leads to higher posts and responsibilities.

The business training of a purchasing agent is of the best, his duties are diversified, his field of action country-wide, and his acquaintance among business men broad and comprehensive.

It has been said that the purchasing agent, although a responsible head of a department, performs his duties to greater disadvantage than do the heads of other departments and with less official recognition. This may have been true at one time, but to-day it is different, as the purchasing agent, if a good one, usually is recognized by his superiors and his meritorious work is placed upon a high plane of achievement. He should be one of the highly paid officials, not because it is necessary to place a premium upon his honesty, but because his work is important, his position lofty in the true sense of the word, and his vocation one that requires long years of training and careful study. Through his department large sums of money are spent annually, and the spending of this money for materials and supplies is no easy task, provided judicious expenditure obtains. In this department large sums of money may be saved or wasted.

### Knowledge Must be Extensive

The knowledge of a purchasing agent must be extensive. Where it is his duty to secure many and varied substances or articles, he must be familiar with the nature, cost and process of manufacture of the articles in question in order to discuss intelligently the propositions of the different salesmen he may meet.

When the buyer is thoroughly informed regarding the costs incidental to the production of an article and the conditions prevailing in the locality where it is manufactured, he is able to decide with a remarkable degree of accuracy just how much profit the manufacturer is making by the sale. If this profit is somewhat liberal he has some reason for expecting a better price, and may insist more forcibly upon the same being granted. Manufacturers who fail to keep accurate account of the cost of their productions are in no position to furnish their salesmen with information on this point. A salesman handicapped by this lack of information, in order to meet the quotation of a competitor, may sell goods at lower figures than is advisable. In such a case the buyer profits, but where the concern producing the goods and the salesman selling them know exactly the cost of producing, the salesman will turn down an order rather than book it at a loss.

The buyer must be on constant watch for adulteration in the articles he obtains. Although samples of an article may be submitted for his inspection which are perfect in every respect, it frequently happens that several may be found in the shipment which do not fill the requirements. In such a case, the inferior articles must be brought to the notice of those from whom they were obtained and an adjustment effected.

Another unsatisfactory condition, which, if allowed to continue indefinitely, would work a loss for his firm, results from a tendency on the part of heads of departments to rush to the purchasing agent with a requisition for this or that which they may have already in stock, but which, through lack of diligence or care they fail to discover until fresh stock is ordered. To counteract hasty buying the buyer must possess an intimate knowledge of the needs of each department as the heads of the departments themselves. In order to act fairly to each department, without bringing undue expense upon the firm, he must in fact possess an extremely detailed fund of knowledge of everything connected with the business.

### Duties Enumerated

Briefly enumerated, the duties of a purchasing agent and his department consist of securing catalogs, names of manufacturers, dealers, and other information regarding sources of supplies, obtaining samples, and, where necessary, having the same subjected to test. In conjunction with the superintendent or general manager, he prepares schedules of materials required, secures bids and distributes orders. Records of all orders must be kept, and a systematic method followed for tracers. All orders that are not filled within a reasonable period must be followed up.

When the goods are received he must acquaint himself with the accuracy of the amount, of their quality, see that they are properly stored in the stores department, which he also controls, and require from the stock clerk and his assistants an accurate report of all goods received or sent out.

To perform these duties satisfactorily records must be kept of all sources from which supplies are obtained and the quotations given on each article or class of material.

### Trade Catalogues

A systematic collection of trade catalogues filed according to some prescribed method and furnished with an index is essential, as well as a record of all previous purchases showing the nature and amount of the goods, where they are obtained and the prices paid for the same. To keep accurate and systematic records of all necessary information involves the adoption of a suitable system of recording and filing. In many cases the designing of the system is entrusted to public accountants, who make a thorough study of the business and devise methods applicable to the case in hand.

With a crude or inferior system, even extraordinary ability would be of little avail on the part of the persons involved, but the combination of a suitable system and good common sense is almost certain to result satisfactorily.

It is usually an easy matter to secure the names and catalogues of dealers. A new concern is usually made the recipient of a great deal of such literature as soon as concerns in the same or similar lines are aware of its existence. A matter of fully as great importance is to have information so arranged that it may be instantly available.

### Card Index System

In a business handling many lines a record system of value is based upon the card index. The first subdivision of the card is based upon the classification of the goods, and under each class are placed the names of the firms dealing or manufacturing in that particular line. The filing of cards may be effected either in alphabetical or numerical order.

Where the number of catalogues to be considered is not very great, they may be kept in bookcases or other receptacles arranged under the names of the firms. In many cases the use of an index may be unnecessary as the distinctive appearance of the different catalogues is sufficient to render their recognition easy.

In extensive systems a numerical arrangement is more satisfactory; a sticker may be attached to each catalogue on which is written a number and date of issue. A certain group or series of numbers may be used for each line,

as, for example, [illegible] to 200 special steel [illegible] and so on. If the number of catalogues on any particular line [illegible] number assigned to the line, they can be numbered as 1a or 1b, etc., without disturbing the index as a whole.

Bound catalogues and others having sufficient stability to stand on end may be placed conveniently in sectional bookcases where they are in plain view and can be located without reference to an index. Phamphlets are better placed in vertical files.

### Catalogue Index

The index to the catalogue list is of vital importance. One method of preparing such an index is as follows: A card of suitable size bears at the top the name of a certain class of merchandise. On the body of the card are written the names of the concerns handling such a line. Opposite the name of the firm are numbers which indicate the location of the catalogue. Where only one or two pages in the catalogue are of interest, the page number should be placed on the card, thus effecting a considerable saving in time. The cards when filled are filed alphabetically under subjects, and may be kept in an ordinary card tray or drawer in a desk.

In some cases the above method is reversed. The cards give the names of the firms at the top, while the names of the articles sold follow in alphabetical order. Inasmuch as a number of concerns may furnish quotations for a certain quantity of goods, or one firm may quote on a number of different lines, some systematic record must be kept of all such quotations. In addition, the date of the quotation should be specified, as well as the quantity on which the quotation was based, the initials of the salesman by whom the quotation was given, the list price, discount, and net price, whether the goods were f.o.b., or to be delivered and the terms of payment. When an order is given, it should be recorded on the card on which it belongs, but all quotations should be personal and filed in a fashion governed by the nature of the business.

The catalogue file should contain catalogues of almost every manufacturing institution in such condition that easy reference may be made thereto, not only as to the manufacturers' names but as to the particular materials and supplies handled. Therefore, in connection with many such files may be found a cross-reference system, in which the catalogues are referred to by names and cross-references made as to materials and supplies handled by each manufacturer.

An inquiry list should be kept, in which should be found the names and addresses of manufacturers, alphabetically arranged and numerically compiled so that when a requisition is received from the stores, mechanical or any other department, it is only necessary for the purchasing agent to mark opposite the various items thereon the numbers on the list under which the various items are classified. Inquiries are then sent into the market, prices obtained and tabulated, and orders placed with the lowest bidders, consideration being given to quality of materials and shipping dates.

### Records of Purchases

For keeping the records of all purchases, cards should be prepared showing from whom the purchase was made, the number and date of the order, the quantity bought, and all information relating to discounts, prices and terms, which are filed in a similar manner to the quotation cards.

Loose-leaf devices can be used very advantageously for the recording of information in reference to purchases. The name of the firm from whom the goods are bought is written in a column in the center of the page. On the left all the facts concerned with the ordering of goods are set down, while on the right the name of everything relating to their receipt and disposition is noted as fully as possible.

### A Uniform System

In the purchasing department matters should always be arranged, if possible, so that the procedure would be the same regardless of the nature of the goods obtained. While some people are opposed to red tape in the transaction of business, it must not be forgotten that, where extensive interests are involved, some routine work is unavoidable.

For example, when the foreman of a department in a large manufacturing concern finds it necessary to be supplied with certain articles, let us trace the various steps taken before these articles are delivered into his hands. The foreman prepares a requisition on a form provided for the purpose. Such forms have the name of the department printed upon them, and frequently those for a particular department have a distinctive color. Each sheet is also consecutively numbered. The requisition should state the purpose or job for which the goods are required, their exact description and the quantity necessary. It must then be signed by someone in authority, usually the head of the department, or vouched by the superintendent. It passes to the purchasing department if the articles requisitioned for are in the stores and the purchasing agent is convinced that a genuine need exists in the department for such supplies, the same will be delivered.

Perhaps if the articles asked for are not in hand, others may be substituted, but if this is impossible some outside source of supply must be called upon. A copy of the requisition is usually kept by the department. Sometimes three copies are prepared, two of which are sent to the purchasing department. On one of these the purchasing agent notes what is being done in regard to filling the requisition and returns it to the foreman. This, however, cannot be considered essential, as the foreman is chiefly interested in getting his supplies, regardless of the process involved.

### The Requisition

The requisition may be termed the nucleus around which the entire department work is centered. Requisitions are issued by the various departments, setting forth in detail the materials and supplies required and are usually sent direct to the purchasing agent, after being approved by the proper officials. These requisitions should convey complete information, including correct technical description, as well as shipping instructions and dates when materials are required.

The requisitions, when reaching the purchasing department, are put through the system as previously described for the placing of orders. The purchasing agent should be left with free hands for action, accounting only to his superior.

## KEEPING THE SHOP BUSY

By D. A. Middleton

THE average small shop that does jobbing and builds a special machine once in a while, and perhaps manufactures some patented article, too, experiences dull periods just as do other businesses. The class of men in such shops is more of the all-around variety that is slow to train, hard to get, and harder to keep, and it is a decided loss to let such men go because work is slack. If the men know that they will be provided with work enough they are not nearly so apt to be always on the lookout for another job. But the trouble the management has is that the work comes in bunches and then falls off.

A certain shop, Brown's, by name, in the city of R——, employs fifteen to twenty men when times are good, which was about all of the time for them. The men had been with them for years and, as it was known as a steady shop, it had been able to weed out the poor ones and keep the hustlers. There were other shops in the town and there were mills in the surrounding country, but the location was not what could be called in a mechanical region. The other repair shops had their ups and downs and were known to cut prices to get work. Brown believed that good repair work and experimental work could be made to pay as well as the little manufacturing he did and his shop proved that to be so.

It was a saying in the shop that "Brown always knew where he could scare up a few jobs of work when we got slack." Brown himself was a thorough all-around mechanic with a technical education to round it out, also he was something of a salesman in his way and the fact that he had a good foreman left him free to solicit business and plan without a mind befogged with a multitude of shop details. His idea of a vacation, the only one he ever took, was to start out in the Ford or on foot and call on a few friends for the day.

Brown often said he would rather spend an hour in a man's factory than in his parlor, and the feeling was mutual for he was a welcome visitor in every shack where there was a wheel turning for miles around. And while he enjoyed the smell of the engine room, he was getting track of an overhauling job that would have to be done at a future date. Brown knew the condition of the ma-

chinery in most of the plants in the region because on these visits his opinion was sought and his advice freely given. It was not strange that the work the plants themselves could not do came to him. But if it did not he went around to find out if it was not ready, for all these future jobs were noted in his little book.

This book contained a summary of each job, about how much labor was involved and what materials, together with the probable date when it could or would have to be done. Any visitor might have acquired the same information but would not have put it down for business purposes; the men in the plants laid it to Brown's good memory and were pleased when he came around and asked if it were not time to repair that stuffing machine or to make a set of new brasses for the Corliss engine. And the fact that Brown had on hand just the size of shaft needed or the stock for a certain set of bushings pleased still more if the job was hurried, but Brown's little book had seen to it that these parts were in stock if they were not specials.

Sometimes it was an engine room and sometimes it was an office that was treated to a visit. Once the Ford stood a whole day in front of the creamery down at Brookfield where they made the finest cream cheese. Brown came home that night all spattered with cheese but with an idea for a machine to mould and wrap that cheese instead of the hand methods then in force. He worked on the idea at spare times, made drawings and experiments with wood models, and a year later when his shop work was beginning to taper off he got an order for a machine at $5,000 which in the end netted a handsome profit. The machine was semi-automatic, and, after the kinks had been taken out, it did the work of six men in the creamery. It also paved the way for several other jobs of consequence.

Then there were jobs nearby that no one thought of going after. In the dead of winter he actually got around that tightwad Jones who ran the ice cream factory and made him see the advantage of overhauling his freezers and his ammonia system then instead of waiting for them to lay down on him in the summer rush. And the other extreme was the brewery which was good for a repair job any time the shop was slack.

## STRIVING AFTER NATURE?

CONSIDERABLE notoriety has been achieved during recent months by an individual rejoicing in the name of Giradossian, who has influenced certain members of the United States Congress sufficiently to bring before the House a scheme which he wishes to have tested by the Government. The entire proceedings have been so irregular and spectacular that more than ordinary interest has been aroused in engineering circles. Our contemporary "Power" treated the matter editorially in a recent issue, and its comments are very much to the point. Under the caption "Power from the Air," it says:

It is recorded that the Lords of the British Admiralty rejected the propeller when it was proposed by Ericsson, and Dr. Lardner demonstrated that a steam-propelled vessel could never cross the Atlantic. In the absence of a demonstration the injector might well have been regarded as a mechanical absurdity, and a proposition to converse across miles of space, without even a wire connection, would have sounded insane a half-century ago.

The open-minded attitude induced by the contemplation of such instances need not, however, lead one to take seriously a proposition to make ten pounds of sugar out of nine pounds of cane, or to take out of a train of mechanism more energy than is put into it.

Garabed T. K. Giradossian, an Armenian mechanic, claims to have invented a "free energy generator." This, he says, is not a perpetual motion, but makes available a free source of energy, by which vessels may be propelled to any distance without stopping to coal up, airplanes may fly around the world and carry thousands of pounds, torpedoes may be projected at great speed, and the speed of steam engines doubled (although it is not apparent what we should want of the poor old steam engine any more).

We have a great admiration for Garabed T. K. Giradossian, not as an inventor, for our office is the depository of countless schemes for the multiplying of power and evading the law of the conservation of energy, but as a promoter. In "Power" for July 31 was told how he had appeared before the House Committee on Patents, which issued twenty-five pages of printed report about his invention and various subjects more or less touching on and appertaining thereto. The committee has now reported a bill which went through both Houses of Congress with a whoop, providing that the device shall be tested by a board of five scientists to be selected by Mr. Giradossian and approved by the Secretary of the Interior.

Every once in a while somebody discovers that water is a combination of oxygen and hydrogen, and declares that all that a vessel has to do to secure an unlimited supply of fuel is to decompose some of the water upon which it is floating and burn the hydrogen that is produced with the oxygen from which it has been separated. The trouble is that the water is the product of a previous combustion of hydrogen—a union of hydrogen and oxygen—and that it takes just as much energy to separate them as they generate in coming together, just as it takes as much energy to hoist a weight as it will give back in falling.

Is there any reason to hope that Mr. Giradossian's project has any firmer foundation?

It cannot be said that Mr. Giradossian's dream is impossible of realization. The process is going on continually before our eyes. Carbon, in its various forms of coal, wood, charcoal, oil and other fuels, is burned by combination with oxygen, the product of the complete combustion being carbonic-acid gas. To decompose a pound of this gas would require as much energy as would lift a ten-ton weight over one hundred and fifty feet, but here comes in one of the most wonderful, beautiful and mysterious of nature's processes. It is a peculiar property of vegetation that under the influence of sunlight it can overcome the attraction which exists between the atoms of carbon and oxygen, appropriating the carbon to its own use, building it into its structure, and letting the oxygen go free into the atmosphere.

To separate these two elements in our laboratories, we are obliged to resort to the most powerful chemical agents and to conduct the process in vessels composed of the most refractory materials, under all the violent manifestations of light and heat; and we then succeed in liberating the carbon only by shutting up the oxygen in a still stronger prison. But under the quiet influence of the sunbeam in that most delicate of all structures, a vegetable cell, the chains which unite together the two elements fall off, and while the solid carbon is retained to build up the organic structure, the oxy- the atmosphere. To separate a pound of carbon from the oxygen with which it unites in burning would require the expenditure of an amount of energy which would raise the weight of a ton to the height of over a mile, and yet in the economy of nature this process is constantly going on, not with the noisy demonstration of prodigious effort, but quietly, in the delicate structure of a green leaf waving in the sunshine.

Has the Armenian mechanic discovered the secret of the vegetable cell?

## GEAR MAKERS TO MEET

"GEAR Standardization" will be the principal subject of discussion at the second annual convention of the American Gear Manufacturers' Association, to be held at Green Brier Hotel, White Sulphur Springs, W. Va., on April 18, 19 and 20. An address by a representative of the United States Chamber of Commerce, of which the association has just become a member, will also bring matters of timely interest before the association.

The convention will begin with meetings of committees on Thursday morning, April 18. At 1.30 the first session will open with an address by President F. W. Sinram, "The A. G. M. A.—Past, Present and Future." Following the address by the Chamber of Commerce representative C. R. Poole will talk on "Hardening and Heat-treating of Gears," and B. F. Waterman will present the report of the standardization committee.

Friday morning's session will include reports of officers and committees, election of nine members of the executive committee and miscellaneous business. An informal banquet will be held in the evening.

On Saturday morning a paper on "Uniform Cost Accounting" will be presented by J. H. Dunn, and on "Hobs and Hobbing Machines" by a representative of the Barber-Coleman Company.

A programme of sports and amusements has been arranged.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## DRIP CUPS ON HANGERS

By F. Scriber.

NEARLY every person is familiar with hanger drip cups in some form or another as these range from a common tin can with a wire through it, hung over a bearing to some of quite elaborate design. The purpose of these drip cups is to catch the overflow from the bearings so that it will not be continually dropping on anything below and also to save the oil wastage.

One of the most common drip cup designs is illustrated in Fig 1. which shows a cup that is held to hanger by means of a screw. To remove this cup from the hanger it is necesary to screw the cup A off the stud B and when this has been done a few times the cup is quite apt to become loose on the stud. A loose cup attached to a hanger, over a man's head is quite a source of danger as it may fall down any time and the writer has known this type of drip cup to jar loose and strike an operator standing below at his machine on more than one occasion.

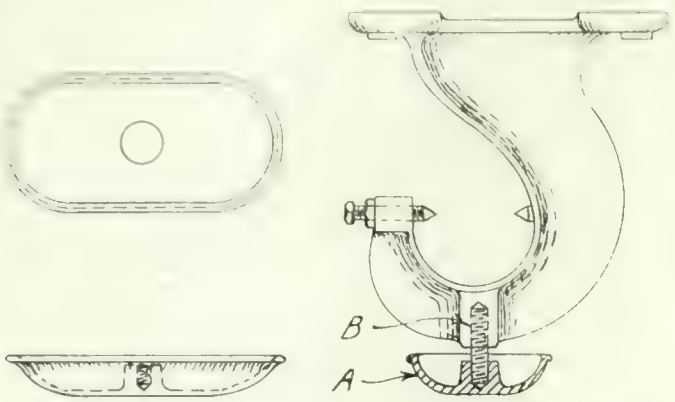

FIG. 1. TYPE OF DRIP CUP THAT IS APT TO WORK LOOSE.

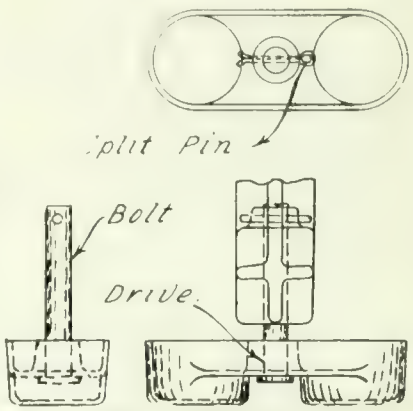

FIG. 2. DRIP CUP HELD IN PLACE BY BOLT AND SPLIT PIN.

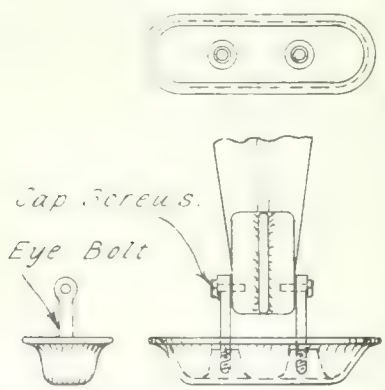
Another drip cup that is objectionable feature in that two hands are necessary for removing the drip cup from the hanger to empty out the oil. This to a man on the top of a ladder is rather troublesome although if a pump is used for removing the oil this drip cup does very well. Nevertheless, as it is impossible for a designer to know beforehand whether a pump will be used or not it is a good plan to have the convenience of the man who is responsible for keeping drip cups clean in mind when designing a countershaft.

Fig. 3 illustrates a type of drip cup where both of the objections mentioned above are eliminated. This cup is held to the hanger by two eye bolts and these bolts are screwed in place before putting the drip cup in place. Through the eye bolt cap screws are placed and the drip cup is free to swing on these bolts although the bolts are a tight fit in the hanger. To remove the oil from the drip cups they are swung to one side and, with a pail placed underneath, are readily emptied.

Such things as drip cups may seem to be mere trifles in machine design but to one who has to stand on the top of a shaky ladder to clean them or work beneath them they are vital subjects in the day's work.



3. DRIP CUP HELD TO HANGER BY MEANS OF TWO EYEBOLTS.

A drip cup that is held to the hanger by means of a split pin is illustrated in Fig 2. This type of drip cup is not likely to jar loose or fall down provided the pin is properly inserted, but it has one ob-

## GRIPPING AND DRIVING METHODS FOR LATHE WORK—IV.

By F. Scriber.

### The Elimination of Vibration

MENTION was made at the start of this article about it being necessary to balance a spindle nose fixture to eliminate vibration where the work operated on

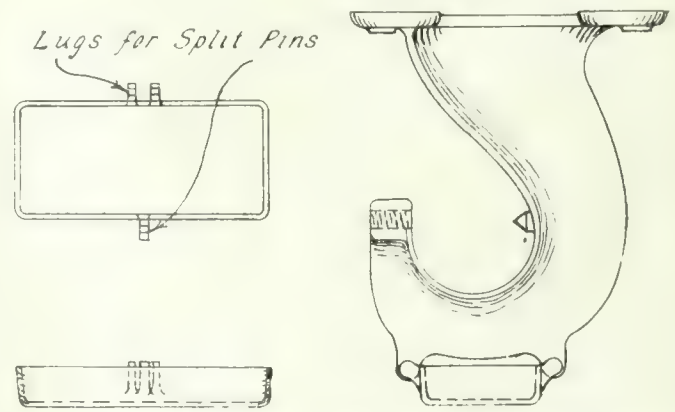


FIG. 4. DRIP CUP HELD TO HANGER BY TWO SPLIT PINS.

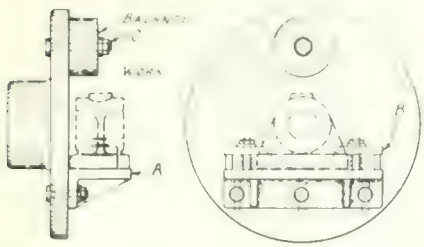
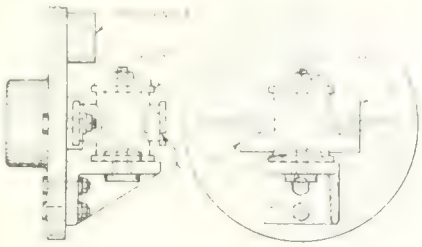
Another drip cup that is easily emptied and cleaned is shown in Fig 4. This is held to the hanger by two split pins, suitable lugs being cast on both the hanger and drip cup to receive the pins. The manner of holding this drip cup in place is obvious as the lugs and pin at one side of the hanger form a hinge upon which the drip cup swings. The pin and lugs at the front side hold the drip cup in position and when it becomes necessary to clean out this cup it is simply a matter of pulling out one of the split pins and letting one side of the drip cup swing down.

was all on one side of the face plate. Fig. 24 illustrates two examples of this type, the upper one showing a bearing mounted on an angle iron A. The work is located in the position shown and is

clamped by means of two clamps B. As all the weight on this fixture comes at one side, a counter-balance is placed on the opposite side, and is held there by bolt C. It is sometimes necessary to put



Method of Holding Bearing Bracket



Method of Holding Tee

FIG. 24. TWO EXAMPLES USING ANGLE PLATES ON FACE PLATE

two or more of these balances on to obtain satisfactory results.

The lower view shows a cross-shaped piece which is located on a plug D; this plug is held in the angle iron E and two vee blocks, F and G, are used to hold the end of the work that is nearest the spindle nose, while the bolt, nut and

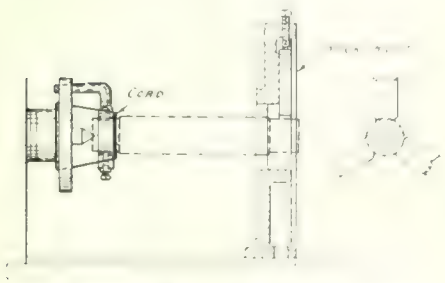


FIG. 26. TIEING WORK ON CENTER WHEN USING BACK REST

washer H bind the work securely to the angle iron. The operations performed on this piece consist of boring the hole X and facing the end. A counter-balance as noted is also used with this fixture.

A face plate where vee blocks are used to good advantage for locating work is shown in Fig. 25. In this instance the two round ends on the work are located in the vee blocks A and the work is clamped in position by means of the straps B, which are two in number. Two screws C are used for backing up the work while the hole is bored and the end faced.

It frequently happens in machining work that a centre hole must be picked up or a hole bored in one end of a bar, and when it is not practical to hold the work in a chuck it is, of course, necessary to use some other means. Fig. 26 illustrates a method often employed, and here the work is held on a centre at one end and in a back rest at the other, while a cord is used for tying the work into the machine. It is a good plan when holding work in this manner to tie the cord with the face plate loose on the spindle, when by tightening the face plate up the cord is drawn taut.

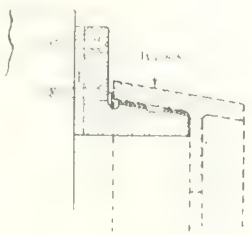

FIG. 28. METHOD OF GRIPPING UNDER RIM ON BEVELLED WORK.

In the example shown it is desired to bore a hole through the bar and the work is first centred; this is followed by turning a spot true at each end of the bar, when by holding the work in the manner shown a hole is bored half-way through; after this a short plug is put in the hole bored, the work is reversed in the machine, and we proceed to bore the hole through the remaining half of the bar.

A group of safety lathe dogs are shown in Fig. 27, the object of these varied designs being either to eliminate the screw head or so protect it that it will not catch a lathe operator when revolving. The first of these in the upper left-hand corner shows a common dog with a headless safety set screw in position; below this is shown the same type of dog with two such screws in position. In the upper left-hand corner a dog with a protecting web is shown; this screw may be tightened by means of a socket wrench or an ordinary wrench. In the lower right-hand corner a dog having a tail bent up to guard the screw is shown.

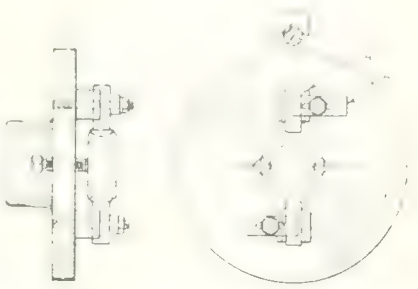

FIG. LOCATING WORK WITH VEE BLOCKS

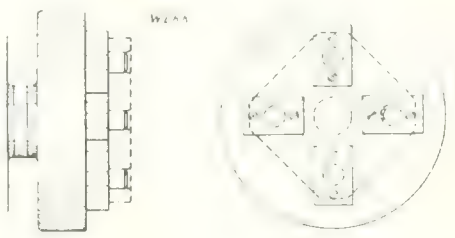

FIG. 29. FOUR-JAWED CHUCK WITH PIN JAWS

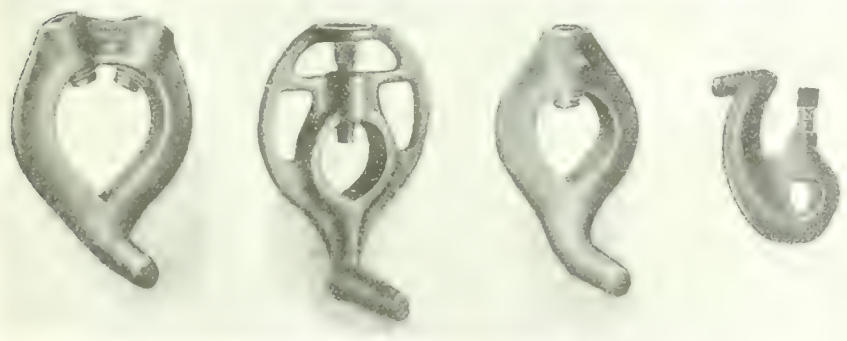
In Fig. 28 a long chuck jaw gripping under the rim of the part which has to be turned is illustrated. These jaws are beveled, and where the angle on them is not more than 15 degrees this method of gripping is quite efficient, provided the jaws are scored. Referring to the illustration, Fig. 29, this shows pin jaws gripping in the holes of a square-shaped block. The operations performed on this piece consist of boring the hole and facing the end; the work is slipped over the pins and the chuck is tightened in the usual manner, thus securely holding the work in place by the four holes. A set



Twin Safety Set Screw Dog

Protected Set Screw Dog

Safety Set Screw Dog.

Bent Tail Safety.

FIG. 27. A GROUP OF SAFETY LATHE DOGS

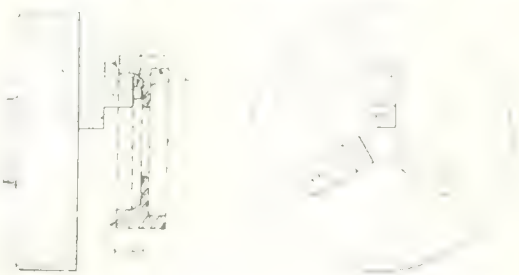


FIG. 30. CHUCK JAWS GRIPPING INSIDE WITH LOCATING PIN.

of chuck jaws which hold the work away from the chuck and grip under the rim are illustrated in Fig. 30. In these jaws pins are used at A to locate the work

from the wall. It is evident from this set-up that the work may be turned, bored and faced; the screw thread can be bored and the web faced at B, while a tool can also face C.

### Chucking and Holding Gears

Many devices for gripping gears are in operation, and a set of chuck jaws which may be used for this purpose are illustrated in Fig. 31. These jaws are made to grip the outside diameter of cast gears, and are simply beveled out to conform to the shape of the gear. That it may not be necessary to grip the jaws tight enough to damage the teeth of the gear a driving pin, as indicated on the illustration, is used to come between one of the teeth and take the drive.

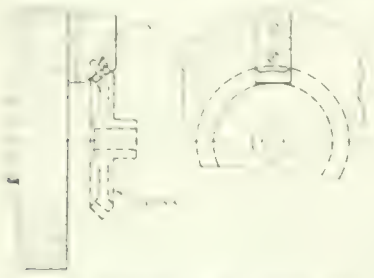

FIG. 31. CHUCK JAWS USED FOR BEVELLED GEARS.

It often happens that in gripping work it is impossible to make all jaws come in contact with the same when these are fixed, as, for instance, two jaws might securely locate the work in place; but if a third jaw is used this will throw the work out of true; in such cases it is common to make one jaw or more if necessary floating. A simple illustration of this type is shown in Fig. 32, where it will be noted that on top of the jaw proper another jaw held in position by a stud A is mounted. This jaw is free to float on the stud slightly, and is also backed up by the solid metal at B. As this jaw is tightened, it is free to float one way or the other until both of the points X conform to the shape of the work in the position where the work sets. It is evident from this that a floating jaw does not distort the work or throw it out of its locating seat; nevertheless, it securely holds the work in place when used in conjunction with other jaws.

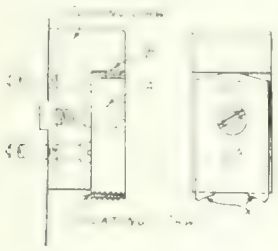

FIG. 32. FLOATING JAW USED FOR CHUCKING IRREGULAR WORK.

Fig. 33 shows a gripping arrangement which is an application of standard chuck jaws used in conjunction with a cast iron ring firmly held to the chuck. This is used for gripping on tubular shaped parts, and the end of the work nearest the chuck is gripped by the jaws, while the free end of the work is gripped by means of the four screws A, thus supporting that end while machining.

In gripping with chuck jaws, particularly when holding finished diameters, it is, of course, necessary to make sure the chuck runs true. The work from soft jaws should be tested quite often, and if this is found to be out of true the jaws should be bored out carefully to the size which they are to grip.

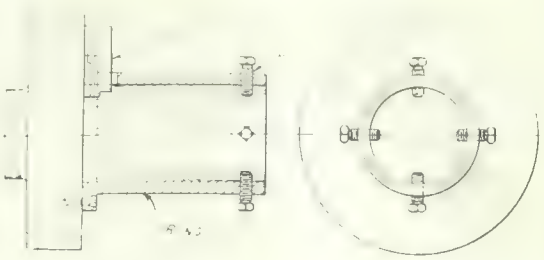

FIG. 33. CHUCK AND JAWS USED WITH TRUING RING.

## THE PIG RINGER IN MACHINE SHOP PRACTICE

By D. A. Hampson

COE was a farmer boy who had come to work in the shop and had been put on a bench job in the manufacturing department. The work was putting collars on spindles of 3-16 in. cold rolled steel; the collars were a single coil cut from a spring made of 1-16 in. wire, which were driven over the end of the spindles and on to the spot where a groove was turned for them; the coil snapped in place in the groove and was closed up a little by hammering to make a more tight appearing job. A smart boy could do 120 per hour, but he had to keep right at it and there was quite a little work about the job.

Coe worked along well, and the second day when the foreman came along he offered a suggestion. "Mr. Brown, I should think a pair of pig ringing pliers would do this work faster than I'm doing it. Of course I don't pretend to know anything about this business but up at Wayland Center we used to put the rings in pig's noses, wires just like this only bigger, with a pair of pliers with a groove in to just fit the wire. These wires are smaller than the rods and I have to drive them on, but if they were bigger and I had a pair of pliers with a groove in to fit the wire I'd put the wire in the pliers and squeeze it around the groove much quicker than I am now. I wouldn't have so many moves to make and so many parts to handle—why you put a ring in a pig's nose with one squeeze of the hand, before he has a chance to squeal, even.

Mr. Brown had never heard of pig ringing before, but he comprehended the idea and thanked the lad for the suggestion. It looked good and it was tried out. Moreover, it proved a time saver. All of which goes to prove that we can learn from the humblest employee in our organization. Very often the simplicity of an operation or our familiarity with it takes an outsider to call our attention to an improvement that can be made. And because that outsider brings with him experience from a field which we would consider far beneath us is no excuse for being too proud to acknowledge the worth of an idea.

## THE BRITISH MUNITIONS INVENTIONS DEPARTMENT

THE Munitions Inventions Department constituted by Lloyd George in August, 1915, has since its inception handled 35,000 cases, and it is interesting to note that the proportion of inventors who are dissatisfied is very small so carefully is the work conducted and so thoroughly is each item investigated for any idea of value to the country.

This department of the Ministry of Munitions deals with and considers inventions put forward by officers, non-commissioned officers and men, and by the general public for use in all military operations and equipment not connected with the navy.

### Personnel

At the head of this department is an honorary advisory council of scientific, military and naval experts of the highest standing. The office staff consists of the comptroller, assistant comptroller, secretary, technical advisers, examiners, military advisers, draughtsmen and clerical staff.

When an invention is received by the department it is submitted to the examiner dealing with the particular class of inventions to which it belongs, and on his reporting it is then submitted to a committee of the advisory council. If an invention is found to have sufficient merit it is developed and tried out under actual service conditions and accepted or declined.

The advice of examiners, who are all technically trained men, the facilities of the drawing office and the workshop actually on the premises, together with those which are afforded by the experimental ground at Esher, and the assistance given by various scientific laboratories are all at the disposal of the inventor, and the department is thus enabled to afford him an amount of technical assistance which would be quite impossible to obtain elsewhere.

### Patents and Rewards

There is attached to the department and housed in the same building a patents and rewards section whose duties consist of:

1. Investigating applications from officers, N.C.O's, and men, and of civilians employed by the government on war work for permission to take out patents.

2. Investigating claims for rewards and royalities where inventions have been adopted for the use of the Crown.

The address of the Munitions' Board of Inventions is Princes Street, London, S.W., and that of the Admiralty Board of Inventions, to which all matters pertaining to naval affairs should be referred is Victory House, Cockspur Street, London, S.W.

# Fundamentals of Apprenticeship: National Interest Grows-IV

Special Correspondence

*Industrial education is to-day the principal educational theme in this country. Employers, business managers, superintendents, thoughtful craftsmen, educators, economists, social workers, men and women in a hundred walks of life, have focussed their attention with growing earnestness upon the problem. Discussions, proposals and theoretical and practical experiments are gradually leavening the great mass of our industrial life.*

### Physical Fitness of Applicant for Apprenticeship.

NO applicant for apprentice employment should be employed who is not in sound condition. Naturally no employer will knowingly employ any boy that has physical deformities or is not in normal health. He should be particularly careful in engaging young people with whom he is to enter into contract relationships that impose upon him specific duties for a considerable time. Every applicant for apprentice employment should be examined for physical or mental condition.

Before engaging an apprentice the employer should satisfy himself upon a number of points among which may be cited the following:

The condition of eyesight.
The acuteness of hearing.
If applicant is tubercular.
Condition of the teeth.
If applicant has adenoids.
Muscular deficiencies.
Nervous condition.
Tendency to hernia.
General state of health.

Physicians will testify to the importance upon the condition of the above will largely depend whether or not the applicant can be classed as physically fit from an industrial standpoint. It is also well to insist at all times upon clean, personal habits upon the part of apprentices and to encourage them in everything that tends towards physical and mental well-being. An occasional class-room talk by a physician upon "The Teeth," "How to Keep in Good Health," "Eating and Sleeping," etc., will repay the expense incident thereto. Talks of this kind, supplemented by class-room examination thereon and examination by the company doctor, is a regular part of apprentice life in some establishments.

### Educational Fitness of Applicant for Apprenticeship.

A boy who applies for apprentice employment presents to the employer a duty which he should not evade. The boy, if employed, will become either a valued acquisition that will develop into a scentific workman (an honor to his craft and a profit to himself and to his employer); or a misfit that will cost the employer money until he is droped; or an "average" workman, with which industry is already over-afflicted. The employer should realize that employing an apprentice is a much more important task than hiring a journeyman—that boy selection entails serious responsibility, the infliction upon industry (and possibly upon his own shop or community) of a lifetime of misapplied and unprofitable energy,—or the infusion into industry of a lifetime of progress that may eventuate into a veritable endowment.

The selection of the apprentice therefore, is second in importance only to his training. Since the apprentice is presumably about sixteen years of age, he will come directly from the school or from a brief period of employment (or unemployment) elsewhere. In the selection of the apprentice, therefore, it is important to take account of the amount and character of his school training.

It was not so long ago when it was said of the boy who lagged in his classes and refused to respond to his educational advantages, "John is no good; he simply will not learn,—he'll have to go to work." And so "John" was sent to some trade for employment, taken in, and he was followed by countless other "Johns" absorbed by industry for the same reason. As a well known commissioner of education has aptly said: "No matter where the fault has been, or whether there has been any fault, the fact is that great numbers of the plain people have withdrawn their children from the schools before completing the elementary course for the too apparent reason that they did not think it worth while to have them remain." It is obvious that most of these children have been received, ultimately, by the employers of the country.

But this attitude upon the part of parents and employers is gradually changing for the following reasons:

(1) The effect of recent child labor legislation, whether intentional or not, and whether the part of wisdom or not, is to exclude from employments offering future progress all boys under sixteen years of age.

(2) Industry has awakened to the fact that workers without mental capacity are like boilers without steam.

(3) The traditional school system is being modified in the interest of those who leave school, either through choice or necessity, before sixteen or seventeen years of age.

As educational fitness will have much to do with the boy's progress and his future development, it is incumbent upon employers to set up certain educational standards, at least for admission to the skilled trades. Employers should recognize the fact that, even in the [illegible] automatic operations of modern complex machinery, a considerable degree of intelligence is required, and that, when this is to be combined with industrial mathematics, mechanics, science, etc., which are absolutely necessary for the apprentice's rightful progress, it is essential that the student shall have a certain educational foundation upon which the employer may build.

The Conference Board, therefore, urges upon the employers of apprentices the establishment of the following educational requirements:

(1) Where the traditional school system prevails, the employer should demand the completion of the work of the grammar school, or the passing of an examination, simple yet determining, to prove that the applicant possesses a mental equipment equal to that of such a graduate.

(2) If the school system makes rational provision for those who leave before sixteen years of age, preference should be given to boys coming directly from the school rather than to those who, having left at fourteen, come from a wandering, two-year apprenticeship in low-grade, unprogressive jobs. This preference should be given especially to pupils coming from those schools where the work is planned to give an industrial interpretation to much of the regular school work; to create an industrial interest or curiosity; and to develop an industrial intelligence.

The Conference Board would suggest, also, the selection of apprentices possessing the following personal characteristics:

1. An earnest desire to lear the trade.
2. Good moral character.
3. Good general standing in school.
4. Mental alertness.
5. Ability to work without close supervision.
6. Good health—absence of physical deficiencies.
7. Age approximately sixteen years.
8. Full average height.
9. No cigarette smoking.
10. Tidiness in appearance.

### Written Agreement Between Apprentice and Company

There should always be an apprenticeship indenture, a written agreement between employer, parent, and apprentice. Every employer who has used it declares in favor of its universal adoption, and large numbers of intelligent employees approve it.

An [illegible] employer:

a. Continuous service of the boy during a definite time.

b. A better grade of boy. An employer will not enter into a contract covering a period of years with a boy whom he does not select with care.

c. More faithful service. By such an agreement the boy realizes that his interests are bound up with his employer's

*Copyright, "Conference Board on Training of Apprentices."

An indenture guarantees to the boy:

a. An opportunity to learn his trade as a whole.

b. A fixed wage and guaranteed increases.

c. Personal interest of the employer.

An apprentice indenture thus guarantees to both parties faithful performance of mutual service, and by "guarantees" is meant, of course, reasonable certainty of fulfillment of a solemn, moral obligation.

Realizing that there should be a standardized agreement that could be adapted in whole or in part to all industries the Conference Board undertook to compile one. As there are various State statutes prohibiting what in other States would be a perfectly legal indenture, the Conference Board aimed to formulate an indenture that could be used universally if desired. Inasmuch as an apprentice indenture is simply an agreement between parties to perform certain acts which are of mutual advantage, the Conference Board came to the conclusion that an indenture or agreement, taking the form of a moral obligation only, without the customary bond given for fulfillment, would probably be permissible in all localities, and of great moral value.

## THE COST IN COAL OF AVOIDABLE BELT SLIP

ONE of the very simplest transmission losses to overcome is belt ship, and since belts are used to so great an extent it is worth while looking into the matter with considerable thoroughness. To show the extent of the loss of money through slipping of the main belt alone a chart, supplied us through the courtesy of the Cling-Surface Company, Buffalo, N.Y., is shown herewith, upon which this is easily ascertained. By glancing up and down column "D" of this chart it is evident that the "cost of avoidable belt slip per year in dollars" may vary all the way from the smallest sums into the thousands of dollars.

Where the power in the first place is generated by a steam engine and is then transmitted to a generator or to the main shaft through a main belt it is evident that the "entire coal pile" passes through that in the form of energy, literally speaking.

If the belt slips, which it should not do, a certain portion of the coal pile does not "get through," but is lost into the atmosphere in the form of waste heat. A main belt is merely a "link" connecting the engine with the generator or with the machines themselves. In fact, every belt that transmits power is a connecting link and the efficiency of that link depends largely upon the freedom from slippage and the avoidance of strain on the shafts. Slipless, easy-running belts are most desirable.

If the power plant is considered as a chain of links, the first link is the coal on the grates, which only perfect combustion can turn into maximum heat; next the boiler shell and tubes they must be clean to bring the heat link to the steam link; next the steam line from boiler to engine or turbine, large enough and well insulated; then the engine or turbine link which joins heat energy and mechanical energy—only careful design, proper valve setting and much care minimize losses here. Then, where power is distributed solely through belts and pulleys, the belts, pulleys, and shafts or electrical cables to the final motors and belts are the connecting links up to the machines themselves.

If the efficiency of every link is maintained at its highest point the power end of the plant is beyond criticism. The overall efficiency will then be very high. But if the efficiency of every link is low or indifferent the overall efficiency of the power end will be distressingly low.

Each per cent. of slip in a main drive represents a loss of 1 per cent. of the coal pile, and roughly 2 per cent. of the potential power in the driving pulley of the engine is represented by belt creep. Its loss is unavoidable because of the elasticity of the belt. This has been recognized and provided for in the chart, so the reader can proceed to connect known values, while the intersection with column "D" gives the avoidable money loss.

Simply zig-zag across the chart twice with a straight edge, as shown by the dotted lines, and the money loss is immediately found. Thus, if the total belt slip is 6 per cent. (column "A") and the cost of coal per ton is $4 (column "B") run a straight line through those two points and locate the intersection with column "C." Then from that point of intersection run over to the tons of coal burned per year (which in this instance has been stated as 1,000 tons) and the cost of ovaidable belt slip per year is shown by column "D" as being $160.

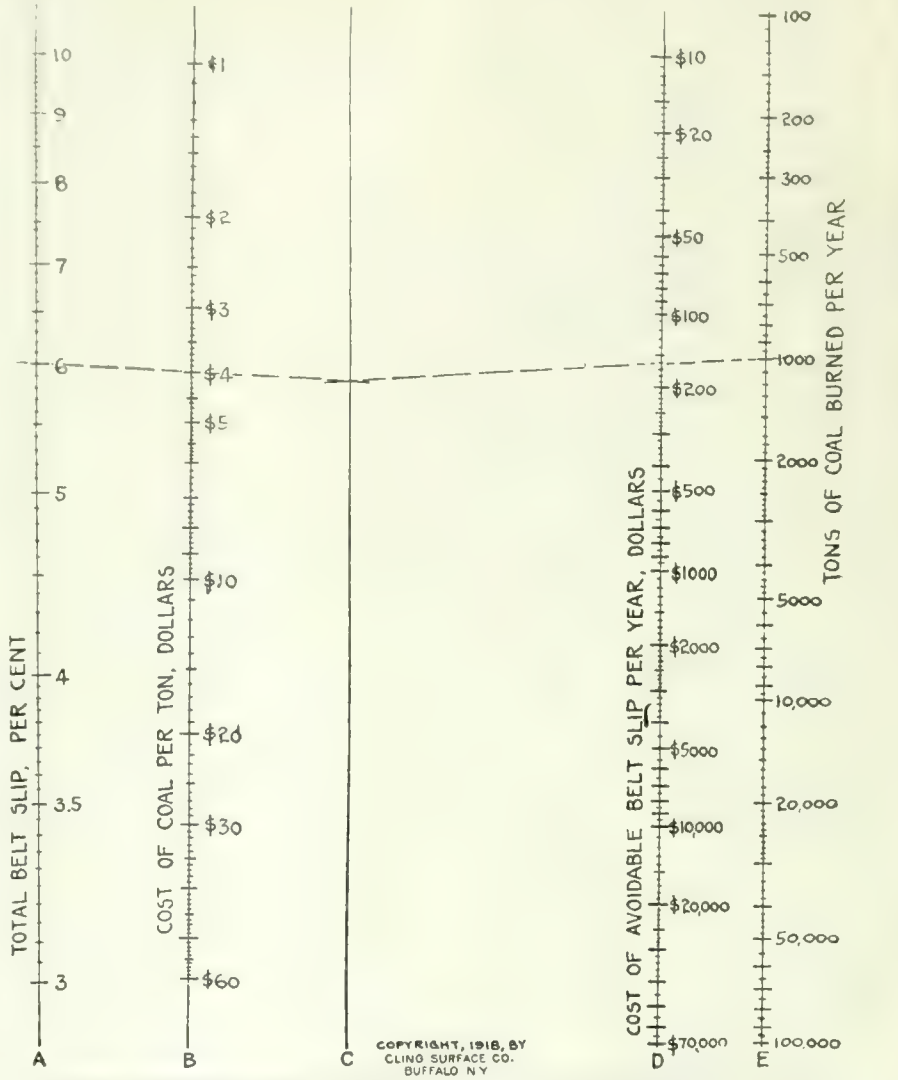

CHART SHOWING HOW AVOIDABLE BELT SLIP INFLUENCES COAL COST

To give a clear idea as to the meaning of "total belt slip per cent." take an example. It is found by means of a revolution counter that a given driven pulley is rotating only 940 times per minute, while calculations show that without slip it should rotate 1,000 times per minute; 60 revolutions per minute, therefore, are absolutely lost. Dividing this 60 by the r.m.p., that pulley should make you get 0.060 or 6 per cent., which is the "total belt slip." After having made this determination, now it is a simple matter to apply it to the chart, as has been done, and determine the money loss per year due to such slip.

# Prospects of Employment of Disabled Men in Engineering

By an Engineering Correspondent

*At the moment disabled men can find plenty of unskilled work at reasonable wages, and the simplest means of dealing with them is doubtless to put them to such employment. This, however, is not their due, the writer contending that employment in casual unskilled labor is a misfortune for any man, but doubly so for those whose health and strength have been impaired. Free and complete training in and access to any desired trade are the least they are entitled to.*

AS the war goes on large numbers of men are being restored to the community deprived in some measure of the physical means for earning their livelihood that they took with them. Some of these will have come out of the engineering trades; and the duty of those trades to make the best possible provision for bringing these men back as nearly as possible to the work in which they have been brought up does not need to be emphasized.

It will be found, however, that the proportion of men in the engineering trades who are so disabled is notably lower than in many other trades, because a large part of the engineering trades have enjoyed an immunity from military service which has been denied to their fellows. This immunity was given originally for the purposes of the State, and, at the time at which it was given, no man who was genuinely a skilled engineer had any option but to accept it. Whether or not advantage has since been taken of this immunity by persons who were in fact not skilled engineers, or whether what was given to provide for the needs of the State has since been claimed as a personal right of those to whom it had been entrusted for the time being, it must be recognized that those who have enjoyed this immunity will be found at the end of the war with a vast advantage over those who, in its absence, have lost a limb or a faculty by which a living could be earned. The most elementary sense of justice dictates that this advantage shall not be asserted as against the men who have lost it in the service of their country; and the obligation to restore to the war victims the utmost possible means of earning a good livelihood is particularly incumbent on those engaged in the engineering trades, who will have benefited so largely by the privileges of their occupation.

### Propect for the Disabled

At the present time no great sacrifice is involved in giving employment to disabled soldiers and sailors so far as they are able to undertake it. The supply of labor in most branches of work is by no means beyond the requirements of the trades, and considerably more could be absorbed if it were available. When the war comes to an end the process of reconstructing what has been destroyed may occupy as much labor as is now engaged on the means of destruction, and enough work may be in sight to ensure a good standard of employment for a few years ahead. But most of the men who are here in question are young. They have in prospect many years of life; and if they are to be prepared to provide for themselves throughout the cycles of fluctuating employment, they must in the meantime have acquired the practice of the trade in which their living is to be gained. At the moment disabled men can find plenty of unskilled work at good wages, and the simplest means of dealing with them is doubtless to put them to such employment. To do so, however, would not be to satisfy what is due to them. It would, for the most part, mean placing them in a blind-alley occupation at the time when they were most amenable to training. When the demand for labor fell off, they would find themselves without a trade, swelling the ranks of casual labor, scrambling for employment in competition with men who are more competent because they have not sacrificed their means of livelihood in the service of their country.

For any man employment in casual unskilled labor is a misfortune, but for the majority of these men it would be utter and final disaster. The stock-in-trade of the casual laborer consists very largely in the use of his body and his physical strength, and men impaired in these respects would be handicapped out of all chance of competition. To give them the opportunity of independence that they earned they must be put into the practice of whatever trades can be brought within their physical means; and in the selection of these trades it is obvious that they will be better or worse off according as the skill they acquire is more or less marketable.

The disabled man has a better chance to-day of acquiring skill than ever he had before. The efficiency of artificial limbs for those—by no means a majority—who require them has grown by leaps and bounds, and is still improving. More important still, the physical re-education of disabled men has been pursued during the war with a systematic completeness beyond all precedent. Happily it has been found that, in contrast with the sufferers from industrial accidents, those whose injuries are caused in war show an extraordinary adaptability to physical re-education; that is to say, to teaching one set of muscles, or even one sense, to do the work that previously had been done by another. The method, moreover, that is now most favored, especially in this country, offers incidental advantages to the patient, which previously were not open to him. In contrast with older practice, and to some extent with what has been particularly developed in France, the methods of English orthopædic surgeons tend to employ actually useful work as the means of re-education instead of the mere practice of exercises. Two consequences follow. On the one hand the patient avoids the mere monotony that has so often sickened him of the beginnings of his new training; while on the other his attention is directed to the actual job he is doing, and thus he is not only relieved of a good deal of monotony, but is diverted from the recollection of his own infirmity.

### The Roehampton Hospital

A number of institutions are springing up with the object of providing the necessary training in various trades. Of these the first was Queen Mary's Convalescent Auxiliary Hospital at Roehampton, and it remains among the most active. It was opened at the end of June, 1915, and up to the end of May last over 7,000 men had been discharged fitted with artificial limbs, and over 6,000 had passed either into employment or into further training with the object of securing it.

The hospital was started originally with the object of providing men who had lost a limb in the war with the latest and best artificial appliances. It was soon found, however, that this provision was only a small part of the work that needed to be done. The large majority of injured men had not in fact lost a limb; and whether they had or not, they were no less in need of physical re-education than of mechanical assistance if they were to enter a trade involving any skill. Accordingly workshops were provided in which disabled soldiers and sailors were enabled to make a beginning both in regenorative exercises and in the aquisition of skill. Among the trades that are here included are various branches of electrical work, wood-working, motor-driving, metal turning, drilling and fitting. It was often found, however, that the period of their convalescence was not long enough to enable the men to acquire sufficient skill, and arrangements were accordingly made with the Polytechnic in Regent-street, whose Director of Education, Major Robert Mitchell, had taken an eminent part in the design and erection of the Roehampton shops, whereby men discharged from the hospital could be passed on to the Polytechnic shops for further training. Since then other institutions have offered similar facilities; and although at present they are in the aggregate only on a small scale, they have served to show a wide range of [illegible]

*Contributed to a recent number of the Times Engineering Supplement.

trial re-education is open to disadvantage, and that they can acquire a considerable variety of skill. Its provision is all the more necessary because patients are kept in hospital only until they are surgically cured and restored to general physical health. In France, on the contrary, they are kept in hospital until they have become perfectly cured and have undergone a sufficient course of training.

### Auxiliary Agencies

Side by side with the development of institutions such as have been described, much activity is being shown both by the State and locally. The Ministry of Pensions provides what, as pensions go, is a liberal scale of allowances for disabled men who are undergoing industrial training. Local committees have been formed in most parts of the country to follow up individual cases and lead them into appropriate courses of education and avenues of employment. The Ministry of Munitions grants, of course, to such men as go into training for munition work the considerable allowances it has been giving for the training of munition workers. Joint committees have been formed in a large number of trades, composed of representatives of employers' federations and trade unions, for the purpose of advising and assisting. Industrial assurance companies have come forward with the liberal statement that they will accept discharged soldiers introduced into industry without any additional premium. Already, in fact, there is an efficient mechanism for most of the various purposes that have to be served in reintroducing disabled men into industry. As yet, however, it cannot be said that this mechanism has been turned to its fullest account; and of all public services that employers in the engineering industries could render to the country and to the men who have suffered in serving it, none is more important than to give their personal assistance to the movement for helping those men into occupations worthy of their deserts.

### Selection of Trades

For whatever can be done by the collective mechanisms that have been set up, there must always remain individual factors which can be dealt with to the best advantage only by individual employers. Many jobs in which skill is required are more or less peculiar to individual trades, and sometimes even to individual shops; and these can be discovered by those inside the works with a certainty that is impossible when the job has to be expressed in general terms, such as are necesary for collective action. When the best has been done for disabled men, they must always remain with a smaller choice of occupation, and therefore a greater risk of unemployment, than men who are free from their handicap. In any work in which they can be brought to an equality with their fellows they are most evidently entitled to priority of employment. In the engineering trades, apart from those engaged at the moment in producing munitions, it is questionable whether they are getting this priority. They are obtaining a certain amount of employment in the electrical trades, and a relatively small amount in machine shops and as fitters. Here and there a special occupation has been discovered into which they are being introduced, such, for instance as in Scotland in the work of colliery firemen who detect and disperse the gas in mines and who are in considerable demand, earning about 10s. 6d. per day of eight hours. To some extent they are being employed in acetylene welding, a very little and inexpensive mechanical assistance being, for many jobs, quite sufficient to put them on an equality with other men. But much more remains to be done, and it seems as though it is now the turn of the employers themselves individually to take the matter in hand.

### Prospects of Employment

Unquestionably the selection of a trade should be determined to some extent by the prospects of continued employment, and the operation of the joint councils that have been constituted for the purpose of furnishing local committees with advice will be watched with much interest. They have considerable opportunities before them. Entrusted, as they are, with only advisory functions, their constitution is free from criticism to which bodies with compulsory powers might be exposed; and the fact that they are composed of representatives of employers and trade unions lends a special interest to the results of their co-ordinate working. The sources of information to which they have access should give them exceptional opportunity of offering the soundest advice. In particular, so far as the prospects of employment in the various trades can be foreseen, they will be in the best position to estimate them. The value of their special knowledge in this respect depends, however, on the use that they make of it, and, in particular, on the candor with which they recognize that the disabled soldier has a claim prior to that of any other man to such employment or work as he can do. When the total numbers of the disabled men who will come into question are considered, the effect on any trade will be seen to be relatively small. But, whatever it is, there will be a considerable temptation, if this trade be one in which fluctation of employment is likely to occur, to bar the admission of these crippled men for fear either of lowering the standard of wages or of reducing the chances of employment for those already in the trade. There is already some ground for fearing that this temptation may lead to obstacles being put in the way of the engagement of discharged soldiers.

The danger of lowering the standard wage is undoubtedly one against which every legitimate precaution must be taken; but the one means of avoiding this danger that should be strictly excluded is to keep out of the trade crippled men who might physically be capable of being brought into it. It is quite likely that for other reasons than the employment of disabled men the practice of instituting minimum wages in various trades will have to be extended; and employers will be well advised to look the prospect fairly in the face, and to prefer the frank acceptance of minimum wages imposed by the sanction of the State to alteratives more provocative of strife and less certain in their action By such means the danger of interfering unfairly with the normal wage in each trade could be avoided. It must, however, be recognized clearly that no measures will prevent the fluctuation of employment nor alter the fact that to such extent as disabled men are admitted into a trade those who are already in it will have to put up with a greater scarcity of work when trade is bad. The choice will then have to be made whether those who are to be unemployed in a given trade, and for the time being or permanently to find occupation in another trade, are to be taken from those who are crippled or those who are not. No solution can be satisfactory which does not provide that the men who have been crippled in the war shall retain their employment, whoever has to put up with the disadvantage of changing. This is especially true of the engineering trades, in which so many men owe the continuance of their employment solely to the sacrifice that has been made by the men who are crippled, and by those who will work no more.

### Need for Frank Co-operation

Above all, the movement for giving their rights to those men must not be allowed to become involved in questions of social or industrial politics. Such questions may be proper and inevitable subjects for discussion when the war is over; but they must not be allowed to intrude into the present purposes of the community, and least of all to affect the community's performance of its duty to its soldiers and sailors. Neither the employers' federations nor the trade unions are entitled to make the discharge of the country's obligations to these men contingent on their adhering either to conditions imposed by a federation or to their joining a trade union. It is quite possible that advantage could be taken of the present situation to bring pressure to bear on men to one or other of these ends; yet such pressure would be illegitimate. What disabled men claim is due to them not because they are copartners in a vested interest claimed by a craft in an industry, but because they have suffered in the service of the State; and however excellent the motive with which one or other of the existing parties in industry might feel tempted to exploit the men's lonely and critical condition in order to drive them in one direction or the other, such action would be mean and discreditable, and sooner or later would hurt all who were parties to it.

### Man Power

The claim for the introduction of disabled men into any industries in which they can acquire the necessary skill is here put forward as what in the first instance it is—a means of giving disabled men what they have earned many times over. But, although this is the aspect in which alone the problem can be approached truthfully, it is not the

only or the ultimate aspect. The men who return from the wars will often find difficulty in accustoming themselves to the necessities of shop life. They will have need, so to speak, of a moral re-education, enabling them to stand up to the relative monotony of a continuous uniform hourly call on their energy, where for the most part they have been accustomed to alternations of intense activity and relative stagnation. But this re-education will be as possible and as certain as the physical re-education and a body of men who have undergone it after passing through the discipline of war will be an addition to the nation's rate the importance if the value of personal character and the habit of co-ordinate effort are left out of account. The sum total of manual skill and of mind-training to mechanical aptitude will be increased, and that in itself will be an asset in a time when the prosperity of the country is going to depend on the increasing of its productivity. But to people its workshops with men of proved character, who have been through the utmost stress to which flesh and blood can be subjected, and who carry with them indelibly the reminder that they are such men, may have an even greater value.

## THE ENGINEERS OF TO-MORROW

By J. A. L. Waddell.

THERE is an imminent matter of vital importance to the American nation concerning which very little, if anything, has been said in the newspapers. I refer to the depletion of the classes in technical schools, first, by widespread volunteering for the army and navy, and, second by conscription. This subject received much attention at the recent Washington meeting of the Society for the Promotion of Engineering Education, an organization of 25 years' standing and composed of most of the leading American instructors in all lines of applied science, and also a few prominent practising engineers. The meeting was addressed by such distinguished men as the secretary of war, the chief of engineers of the U. S. army, and the director of the bureau of standards. The five sessions held by the society on those two days were devoted almost exclusively to questions of public welfare, principally connected with the war.

As I attended all of the sessions from start to finish and took the deepest interest in the entire proceedings, I feel justified in making the following statements, and in claiming that they express the opinions of a number of the most profound thinkers of America.

**First.**—The larger part of the civilized world will have to be reconstructed after the war, not excluding our own great railroad system, which undoubtedly will have deteriorated on account of over-use and lack of adequate upkeep.

**Second.**—Such reconstruction is almost exclusively the work of engineers.

**Third.**—The European technical men have been killed off by thousands during the past three years; and their slaughter will not cease until the war ends. Moreover, it is more than probable that many American engineers who serve in Europe will never return to our shores, and that a large number of those who do come back will be more or less incapacitated from active professional work.

**Fourth.**—The technical schools of all the other warring countries than ours have practically been out of commission for three years, thus cutting down there, almost to zero, the supply of new men for the engineering profession.

**Fifth.**—The call to arms in this country by both volunteering and conscription it is feared will soon have reduced to about one-half the attendance at the technical schools of the United States, while instead of being halved it ought properly to be doubled.

**Sixth.**—In spite of the present paralyzation of many lines of engineering work, due to the cessation of large constructions, and to the absolute lack of capital for important new projects of a peaceful character, the demand for young graduates of technical schools by the manufacturers of war supplies is so great that there is already a marked dearth of such assistance, which dearth will be more and more accentuated as the war progresses, and as the call for ships, guns, ammunition, aeroplanes, automobiles, etc., increases.

**Seventh.**—Until the United States entered the war, it was almost certain that most of the reconstruction work of the world would be done by American engineers, and in any case they are sure to get a fair share of it; but it seems a shame that this country should miss such a golden opportunity as that which lies before it for securing the lion's share.

**Eighth.**—The capacity of the old, experienced, and well-established American engineers for doing work is practically unlimited, provided that there be no shortage of young, properly-educated assistants; because most technical men of mature years have developed highly the faculty of management. On that account the average total annual amount of work engineered by such men in this country could readily be increased five fold, or, possibly even ten fold, without causing undue overstress either physical or mental; and, consequently, the great mass of the work of world-reconstruction could emanate from the United States and be handled abroad by American engineers.

**Ninth.**—It is beyond question that, for the next 10 years or more, engineering is everywhere going to be the most lucrative of all the professions.

### What Deduction is to be Drawn?

From these nine premises what is the most important deduction to be drawn? Evidently it is that, by some means or other, we must manage not only to prevent any falling off in the attendance at our technical schools both during and directly after the war, but also greatly to increase it. And how can this be done?

The answer to this question is not difficult. It is as follows:

**First**—By urging more young men to go to college, and by persuading their parents that it is their duty to send the boys there for the ultimate good of both themselves and the country.

**Second.**—By inducing all sub-freshmen who have shown any special aptitude for mathmatics, mechanics, or chemistry, to take technical courses.

**Third.**—By discouraging the enlistment into the army and navy of all students in technical institutions, but, on the contrary, by encouraging them to remain and graduate, if possible. Of course, those who are drafted will have to serve; for it would, manifestly, be unfair to the rest of the youths of the country to excuse a man from going to the front simply because he is a technical student. Such drafted students, however, should generally be sent to the engineer corps, because their services in that branch of the army would probably be more effective than in any other, and because the training they would receive therein would be likely to serve them in good stead in after years when practising in the engineering profession.

**Fourth.**—By granting government aid to those youths of evident special ability in technical lines who are unable to raise the money necessary for a course of instruction.

If these four steps be taken, the unique opportunity referred to will not be lost; and this country will then become the leader of the world in activity, effectiveness, and wealth.

### An Appeal to Young Men

Let me, therefore most earnestly implore all youths who are ready for college this Fall, and who are not in any way unfitted for technical careers, to take up some branch of engineering or technology; and let me entreat the parents or guardians of such youths to exert their influence so as to induce the boys to choose that line of study for their life work. Remember: it is not only for the good of the country that I make this appeal, but also for the ultimate benefit of the young men themselves!

Some reader of this communication may remark that such an appeal would possess more force if it were to come from a national engineering society than when emanating from an individual engineer. Very true! But until quite lately there has been no engineering society which draws its membership from all lines of technical activity; and the one which is now being formed, viz., the American Academy of Engineers, has not yet received from congress the national charter for which it has applied. Were that association to-day fully organized and duly recognized by the government, it assuredly would make such an appeal as this, and, in my opinion, that appeal would immediately be responded to by the nation, for the American people certainly are sensible enough to heed seriously any words of warning coming from a select body of the most practical men in the land.

## RECONSTRUCTION MUST PRECEDE EXPANSION

WHATEVER the ultimate distribution of the world's markets as a result of the war and despite the indefinite prolongation of involved commercial conditions such as must result from the later German conquests, the need of export business as a means of maintaining Canada's industrial status at the requisite height becomes increasingly apparent with the passage of time.

The necessity for immediate recognition and investigation of future possibilities has been periodically impressed upon manufacturing circles with each succeeding lull in munitions work, but adequate steps on a nation-wide scale do not seem to be contemplated by any responsible body, whether government or otherwise.

The whole question of export trade, its possibilities, desirabilities, difficulties, risks, is in a great measure an unknown quantity to many of those who seem to see in it a solution of post-war tribulation. It is invariably brought forward as a sort of vade mecum, a cure-all, an ultimate remedy for the many aches, pains and industrial creakings which are bound to accompany the readjustment of our country's industry.

In considering ways and means to insure a minimum dislocation of industry during the transition period, attention might be directed to certain governmental activities in Britain. Steps have already been taken in advance of conditions, and the Old Country is meeting trouble more than half way with a view to overcoming it more promptly and more effectively.

A committee composed of manufacturers and business men has been appointed to consider the provision of new industries for the engineering trades. Its duties will be to compile a list of the articles suitable for manufacture by British engineers, which were either not made in the United Kingdom or were made in insufficient quantities, and for which there is likely to be a future demand.

The articles are classified in three main groups, according to the class of labor necessary for their production, i.e., women; men and women; skilled men. Recommendations are also to be made by the committee regarding the establishment and development of these new industries by the transfer of labor or machines or by other measures; also as to the best methods for securing the co-operation [illegible]

Owing to the war industry in this country having been developed along different lines from that of Britain the absence of controlled factories, etc.,—there is not the same probability of close governmental co-operation, yet such would seem to be desirable and its occurrence would need to be prior as well as being essential to any organized effort to develop export trade as a feature of Canadian industry.

It must not be overlooked that many of the firms on whose behalf national effort is suggested were non-existent before the war, and many which did exist were not doing much else. All their strenuous activity since then has been non-competitive except as to output. As fighters for the world's markets in engineering products our manufacturers, with certain notable exceptions, were nowhere.

Industries become indigenous as a result of special conditions of materials and facilities. The Committee on Industrial Research has been actively engaged for some months and the results of its labors should soon be capable of indicating some of the directions in which manufacturers may lay plans for future development, always recognizing that lines which are based on more or less exclusively Canadian conditions will eliminate in corresponding degree the intensive competitive feature which seems destined to be inevitably characteristic of reconstruction work in all countries.

## BUYING REAL COAL

A BILL is now in the Ontario Legislature to force dealers to weigh coal on municipal scales or by municipal officials. J. A. Pinard of East Ottawa is sponsor for the measure, and it has been advanced to its second reading.

The chief objection will come from dealers who will not want to cart their coal to civic scales when delivery is to be made in an entirely different section of the city. It will not be practicable to have a civic official to check up the weight at the scales of each individual dealer.

There is a great deal more point and purpose to an announcement contained in the United States Official Bulletin of March 9. The drift of this is that bituminous coal must be mined clean or sold for less than the fixed price.

H. A. Garfield, United States Coal Administrator, has given very wide powers to the district representatives of the fuel administration. In fact, it looks as though they had really been constituted a court of last resort by the fuel administrator. Where the coal in any part of the mine is found to be naturally of such character as to be unfit for market, judging from the usual standard of the district, the district representative may order the mining suspended in said part or parts of a mine until or unless proper cleaning methods be adopted.

Not only so, but the inspectors are authorized to condemn at the mines "any coal loaded in railroad cars which in their judgment is not properly prepared. . . . If the district representative approves the inspection report he shall so notify the operator at once; in which case, unless the operator unloads and reprepares the rejected coal, the consignee shall be permitted to deduct 50 cents per ton from the authorized price for the grade of coal." Of course, the consignee, if he wishes, may go ahead and pay the full price, although this looks like a long chance once the fuel inspector has condemned the coal.

The fuel scarcity that Canada has passed through has brought to many a Canadian home a quality of coal that never could get past in ordinary seasons. This, of course, refers particularly to anthracite coal. There has been more slate and rubbish in the form of clinkers pitched out this winter than the coal burners can conveniently afford to pay for.

# The Fire Losses in Industrial Plants Can Be Kept Near the Vanishing Point

## Chief James Corbett Has Decided Views Along This Line Has Been Head of the Fire Department at the Toronto Massey-Harris Plants for Thirty Years, in Which Time the Fire Loss Has Been Less Than $500.

A FIRE loss of less than $500 in thirty years is the record of the Massey-Harris factories and warehouses in Toronto. When one stops to consider the wide area covered by the plant here, the several thousand men employed, and the large number and variety of operations involved, the record is one that will stand analysis. A cursory survey of the situation will make it

CHIEF CORBETT.
Who has been in charge of Massey-Harris Fire Department for thirty years.

certain that behind such results there is system and care, and behind the system must be a careful and efficient fire department.

Mr. James Corbett has been in charge of the fire department of the Massey-Harris plant for 29 years. To be exact, it was on the 11th of June, 1889, that Mr. Corbett went to the position where he has given such faithful service.

### A Toronto Boy

James Corbett is a Toronto boy. When quite a young man he joined the Toronto Fire Department, being for seven years at the old Court street hall. From there he went to the Winnipeg department, returning from the West to take charge of the fire fighting department of the Massey-Harris Co. As a matter of fact, it is hardly right to refer to it as a fire-fighting system—it's more correct to say a fire-prevention plant.

### Central Control

The entire time-checking devices of the plant are controlled and operated from a central station in the fire hall. When the buzz blows at noon it's because a man in the fire hall presses a button, the time having been secured exactly five minutes before from the observatory. When the time-checking devices in 25 different departments of the shop turn from "on time" to "late" it is likewise because a man in the fire hall has pressed a button. In fact, the man in the fire hall pressing the button attends to quite a heap of things around the plant.

### Mr. Corbett's Devices

The system used at the Massey-Harris has been largely brought to perfection by Mr. Corbett, who is an electrician himself. The fire alarm system is operated by the usual alarm methods. There are 33 fire alarm boxes situated throughout the plant, all directly connected to the central station; besides this the department has nine hose reels, 41 hydrants and 3,000 feet of hose. The sprinkler system has no less than 16,000 openings.

"The sprinkler system is the greatest fire preventer and fire fighter in the world," remarked Mr. Corbett to CANADIAN MACHINERY. "It is impossible to put too much stress on its importance." The Massey-Harris system is also under check at the fire hall, and a defect, through lack of pressure, will at once be registered at the central station, this starting an alarm bell automatically.

### Carefully Arranged

"The sprinklers here," said Mr. Corbett, "are all arranged so that they become operative at about 155 degrees. Of course an exception is made for the boiler and engine rooms, where a greater degree of heat is necessary to start the water. To show how sensitive the system is, we had a mechanic fixing up a room for welding. He started his furnace without any allowance for letting the heat off. In about one minute he and his plant were flooded out. The sprinkler system, you see, is very quick to detect a change in temperature and act accordingly.

### Preventing Fires

"The fire losses in Toronto are away too high," continued Mr. Corbett, "and the most lamentable feature about it is that fully half of them can be prevented. I do not think it is an exaggeration to state that the fire losses can be cut in two by attention and the use of sprinklers. We pay great attention to prevention. In every department where waste is used there are big metal receptacles for this stuff, and we have a force of men who see to it every night that every bit of waste is picked up and burned. That does away with that class of fires often referred to as caused by spontaneous combustion. They are hard to control, and the most effective work in offsetting them is to be done in the way of preventing conditions favorable to their outbreak. Another feature is a good watchman service. Only the most trustworthy men are employed on this work. Our system makes it possible for us to tell in the morning where each watchman has been during the night. We have had a number of calls this year," concluded Mr. Corbett, "in fact the number is a little higher than usual, being 13 since the first of January."

Mr. Corbett is president of the Dominion Association of Fire Chiefs, being elected to that position at the last annual meeting. He is an enthusiast in all matters pertaining to fire fighting or prevention, and in all things connected with the electrical appliances used for recording alarms. Mr. Corbett is also a frequent contributor to publications issued in the interests of fire fighters.

# Much Depends on Action of U.S. Towards New Price Schedules for Iron and Steel

## Trade in Canada is Marking Time Until Some Definite Announcement is Made—C. M. A. Officer Looks for Improvement in the Transportation Facilities Since Railroads Have Removed Most of Their Embargoes

CANADIAN dealers are, like those across the border, waiting to see what is going to take place on the last of March, when the United States Government will announce its decision regarding the schedule of prices affecting the iron and steel industries. Conferences are already under way of the various interests concerned. It is noticeable that the smaller dealers in most cases are those urging higher prices. On the other hand the men with large furnaces claim they can produce at less than the smaller workers, and that pooling supplies, which has been widely suggested, would really mean the putting of of a premium on the less highly organized concerns.

Canadian dealers are beginning to get through their orders that should have arrived weeks ago. The clearing out of railroad yards and the gradual recovery of the roads is being reflected in the stocks arriving in Canadian yards. One lot was placed in a Toronto firm's sheds this week that had been on the road from Pittsburgh since the first of December. Dealers in supplies and tools complain of having had the damper put on their business because transportation facilities are weeks behind.

An official of the Canadian Manufacturers' Association stated to-day that they looked for an immediate and decided improvement in the situation. Embargoes which the roads had placed on shipments had largely been removed, in fact the M. C. R., T., H. & B. and C. P. R. roads were open from the Black Rock and Buffalo ports, and they expected the G. T. R. would soon have a similar announcement. The handling facilities toward Detroit were also showing an improvement and travel was much more rapid. The allied governments had made a special appeal to all the roads to devote their full force to moving foodstuffs toward the seaboard, and on this account other shipments, no matter how pressing, had to wait their turn. That condition has passed and better transportation facilities are now looked for.

## NEW ORDERS KEEP TRADE OUTLOOK UP

### Deliveries Are Much Better Owing to Freer Movement on the Rails

SPECIAL TO CANADIAN MACHINERY.

MONTREAL, Que., March 18, 1918.—The general trend of industrial conditions is toward improvement in all directions. The moderating of the weather has been a large factor in the better movement that is noticed on the different railroads. With the approach of spring the undertone seems to reflect increased optimism in all circles of activity, and greater stimulus is looked for during the coming month. In addition to the announcement last week regarding the acquiring of 500 miles of rails for use on the Canadian Government railroads, it is further announced that orders for an additional 800 miles—approximating 100,000 tons—has been placed by Hon. J. D. Reid, Minister of railways, with the Dominion Iron and Steel Co. These rails will be manufactured at the Sydney plant, and it is anticipated that the entire order will probably be completed by the first of August. In addition to supplying the requirements of the Government it is thought that sufficient rails will be produced to meet the more essential needs of the Grand Trunk and the Grand Trunk Pacific. The purchase is being made on the part of the Government and the needs of the two privately owned roads will be supplied at cost plus charges of transportation. This development will enable the roads to replace rails that have been neglected during the past two years owing to existing conditions. Reports from the west are very encouraging and if sufficient labor is available it is anticipated that the acreage under cultivation in the prairie provinces will exceed that of the previous year by approximately 20 per cent. At present the Canadian Government has under consideration the fixing of a minimum price on the coming year's crop, and it is thought that it will be equal to greater than that of $2.21 which prevailed last year. Conditions generally point to improvement in the coming months.

### Steel

The gradual improvement in the weather has given added stimulus to the production of all classes of materials, and transportation difficulties are becoming less pronounced each day. Some little inconvenience was experienced during the past week, owing to a fairly heavy fall of snow in certain localities. This, however, has had but little effect upon the noticeable bettering of conditions, and a renewal of normal operations is looked for in the near future. The movement of freight on the various railroads has enabled better delivery of goods from the source to the consumer thus reducing the tension that has been felt in this connection for the past sev-

## CANADIAN MACHINERY to be Reference for Buyers for United States Ordnance Department

Buyers of advertising space, and contributors to the technical pages of CANADIAN MACHINERY will find new interest in the following letter, which speaks for itself:

WAR DEPARTMENT,
Washington, March 14, 1918.

MacLean Publishing Co.,
Toronto, Can.

Gentlemen:—I am directed by the Acting Chief of Ordnance to ask if it would be possible to place Captain Turner's name on your list to receive a copy regularly of CANADIAN MACHINERY and any other of your publications which you think would assist the writer in locating machine tools for the plant facilities branch of the Production Division.

JOHN TURNER,
Capt. Ord. Dept. R.C.

eral months. Reports from the States indicate that the situation there has become less tense and the delivery of coke and other raw materials to the furnaces and foundries, has become more regular and in greater quantities, so that production has proportionately increased. Apart from the interest that is manifest in the possible developments in the United States, in connection with further fixing of prices and regulations, the general situation both here and in the States is comparatively quiet. The Government at Washington is working for the closer co-operation of producer and consumer, with a view of minimizing the requirements of non-essentials in order that expediency be one of the chief factors in the prosecution of the war. Before the close of the present month it is anticipated that some announcement will be made regarding any readjustment of prices to govern transactions after the first of April. While few changes are looked for it is believed that better quotations may prevail regarding steel plates, as it is thought that higher prices in this connection would encourage producers to increase their production. In view of the conditions now prevailing in shipbuilding circles, it is almost conceded that the Government will grant some additional concession for greater output. The prospect of a Canadian plate mill has practically become an established fact but some little time will likely elapse before actual construction is proceeded with. An encouraging report comes from Nova Scotia to the effect that the coal production in that province has greatly increased despite the fact that fewer miners are at present available. If additional facilities were provided for taking the coal from the pits the output would be still further increased. Local dealers report a comparatively quiet situation but better conditions in respect to the movement of materials on the railroads, with the result that business is taking on a less disorganized state than that which has marked the operations during the past weeks. The more favorable weather has opened up the way to better conditions and most dealers anticipate a renewal of activity during the coming months. Prices generally are unchanged on a little better demand.

### Metals

With the exception of tin the metal situation has developed no interesting features. The movement of materials has become more regular and consumers are experiencing less difficulty in obtaining required supplies. The copper situation is steady and the trade is waiting the announcement of the American Government respecting the probable adjustment of prices in the near future. Tin has taken on a new and serious turn due to the recent development relating to the suspension of licenses to ship metal from United Kingdom. Spelter is quiet and dull. Lead is tending to weakness. Antimony is quiet and unchanged. Aluminum is not active but price is firm.

**Copper.**—Operations in the copper market are steady in character but the situation is one practically confined to government requirements, as domestic consumers find it very difficult to obtain supplies. Producers are reluctant to release any portion of their supplies to those not directly engaged in the production of essentials, owing to the uncertainty of government demands, which at any time may be such as to clean out their available stock. Minor complaints have been made by some consumers on the delay in the delivery of metal, but on the whole the conditions are considered as satisfactory. Neglecting the possibilities of labor unrest, the production is expected to show further increase under the moderating weather. It is generally conceded that the existing prices are of a character that suits both the producer and the consumer, although any revision that is contemplated before the first of June, may be favorable to the small producer, who is at present operating at high cost in relation to that in force at the time of the previous price fixing. The local situation is steady in character and the supply is normal, dealers report prices firm at last week's week's quotation of 29 and 30 cents per lb.

**Tin.**—The tin situation has become additionally acute owing to the recent report that all licenses to ship tin from the United Kingdom will be suspended for the period of one month. Whether this ruling implies that shipment of metal, already covered by license, will be included in the regulations just issued, is not quite clear, but if this is so it means that the immediate future of the tin situation will be marked by increased difficulty in the obtaining of much needed supply, undoubtedly resulting in a very strong position in tin. Negotiations have been successfully completed between the War Trade Board of Canada and the authorities at Washington, whereby the Canadian Government will be able to obtain such requirements as are recognized as essential to the production of the canneries of the country. Close co-operation between the individual canners and the government is the chief factor in the efficient operation of these new regulations. The more recent developments, however, in connection with the tin situation may increase the difficulty in meeting the needs of the can manufacturers, as the inability to obtain supplies will make it impossible for the American officials to meet, in full, the requirements of the Canadian demand. The situation here has become tighter and dealers are inclined to hold available, supplies for essential needs only. The market is undoubtedly stronger owing to recent overseas developments but quotations are nominal at last week's price of 98 cents per lb., although quotations as high as $1 have been asked.

**Spelter.**—An undertone of weakness has developed as a result of the falling off in the buying of metal. The price is not the factor that is the cause of the lack of interest as even with a lower price it is very doubtful whether additional buying would result. It would not be surprising if producers were to further curtail in production as there is little to be gained in accumulating stock under existing conditions. The market here is very quiet with a weaker tendency; quotations are, however, unchanged at 11 cents per lb.

**Lead.**—The lead situation has been marked by a weaker tone following the pronounced activity of sellers to dispose of metal to reluctant buyers; the latter becoming more cautious owing to the attitude of sellers that are forcing metal on the market. The undertone of the market is undoubtedly easier and is reflected in the slight decline that has been noted on the New York market, the quotations having fallen off ⅛ cent during the week. Dealers here report a steady situation with a slightly easier undertone but quotations are unchanged at 10½ cents per lb.

**Antimony.**—This metal is devoid of interest and the market is quiet; dealers report little buying and quotations are weak at 18 cents per lb.

**Aluminum.**—The situation is not marked with any developments and activity is not pronounced; dealers are inclined to weaken in quotations but are at present holding on to those quoted last week, namely, 55 cents per lb.

### Machine Tools and Supplies

Nothing of consequence has developed in the machine tool industry to alter the quiet tone that prevails in all departments. Inquiries for single tools for the 6-in shells have been reported and some business has been done in equipment for shipyards but the activity in either of these lines has been small. Machine tool business at the present is comparatively light. Some little interest has been shown in the report that additional orders for American shell would be placed in Canada but nothing definite in this connection has been annouced. Negotiations are reported to be on between the United States and the Imperial Munitions Board regarding the placing of considerable business in the munitions line, namely, aerial bombs for aeroplanes. The prospect of this business has renewed the waning interest of those manufacturers formerly engaged in the production of munitions, and should this new activity develop further it is expected that the machine tool interests will become more active. The demand for all classes of supplies is maintained on a pretty fair basis, particularly in connection with the munitions industry. The delivery of supplies has become much better owing to the improved weather, but difficulty is still experienced in obtaining shipment of goods coming from the States, owing to the embargo that continues on certain materials. The demand for high speed steel continues to be quite active and the price is well maintained.

### Scrap

Despite the improved conditions in the weather the trade in scrap metals has

been quiet during the week. Local deliveries have shown improvement but shipment to the States has become more difficult owing to the embargo that exists. One dealer here has a couple of car-loads of brass scrap awaiting shipment to a buyer in the States but is unable to ship it owing to the regulations that have recently been placed on such material. Generally the market is quiet and business is light. Should the present weather continue it is anticipated that present restriction will be remived as the railroads become in a better position to handle the freight that has become accumulated during the past few weeks. Scarcity of certain iron and steel scraps has strengthened the market and quotations have advanced. Machine composition on an advance of $1 per ton are quoted at $22. Heavy melting steel and wrought iron pipe are both up $1 per ton, the quotations being $24 and $20 respectively. Boiler plate and machine cast iron show an advance of $4 per ton, the price asked being $27 for the former and $31 for the latter. Red brass turnings are scarce and dealers are asking 18 cents per lb., an advance over last week of one cent per lb. Medium yellow brass is weak and is quoted 2 cents below last week, the current quotation being 12 cents per lb. Aluminum is plentiful and the present quotation of 21 cents represents a decline of 4 cents per lb.

## WAITING FOR THE PRICE ANNOUNCEMENT

### Canadian Trade Anxious for New Schedule to be Handed Out at End of Month

TORONTO. Almost every concern touched by the iron and steel industry in Canada can be described as marking time to-day in anticipation of some changes being made by United States on March 31, when the Government will announce the new schedule of prices. Canadian dealers are, in common with those on the other side, on the anxious seat. None of them seem willing to attempt much of a forecast as to which way the price changes will swing, although labor costs and new freight schedules are strong elements in working toward a higher level in certain lines.

Canadian dealers in bars, shapes, structural and plate, car wheels, etc., are not getting the business they would if the embargo fence were down. There are lines of business which they cannot touch because they know they have small chances for getting a license to have this rolled. On this account there are certain lines of domestic trade that are dropping off, and in some cases the mills refuse outright to quote on this business. In lines that can be passed and permits allowed to roll at the mills, the business remains steady, but all lines await the announcement of new

It is a hard matter to state definitely to what extent the increased freight rates [illegible] materials. Dealers seem to see nothing else, though, that as in the case of every other commodity, the last purchaser stands a good chance of being called upon to absorb the added 15 per cent.

### Iron and Steel

With the releasing of railway traffic there is a tendency to look for improvement in iron and steel receipts and production. Importers are beginning to have cars placed in their yards that have been almost four months on the way. Drummond & McCall had a shipment unloaded on Monday that left Pittsburgh on the first day of December last. Another left on the 10th of December but as yet no trace has been found of it. Dealers claim that it is increasingly hard to get licenses and permits, and some of them are watching with considerable interest to see what may be done toward having the Government act in the capacity of buyer for much of the business.

The increased production of pig iron at U.S. points can hardly be said to be reflected in the Canadian situation just yet. It is being largely counteracted by the congestion of traffic.

The curtailment of motor car production is not likely to liberate steel supplies for Canada. There had been a falling off in demand for some time, but this will be counteracted by the announcement which has just been made from Washington that the shipyards are expected to take twice as much steel in the second half of the year as in the first half.

### Machine Tools

Orders and business brisk, but the deliveries very poor, seems to describe the present situation in the machine tool trade. The demand for chucks, reamers and high speed cutters is satisfactory. One Toronto dealer showed CANADIAN MACHINERY the bills of goods, Feb. 28, from Indianapolis; March 1, from Philadelphia and New Britain, Conn., and January 6, Ashburnham, Mass. He has no word from any of them, while in the ordinary way a week would be sufficient to have the goods delivered in Toronto. Some slight relief is noted, though, in the fact that once deliveries reach here they pass through customs more rapidly than formerly.

Dealers report a better demand for some of the heavier machinery in their lines, such as grinders, planers and lathes capable of doing large operations. Development of shipbuilding is responsible for much of this, and the demand seems likely to be maintained.

Slight changes are noticed in the list of quotations for drills, etc., several lines showing 40 per cent. off the list. High-speed jobbers' drills are given as plus 60, high-speed straight shank drills as plus 75, and high-speed taper shank at 75 on. These lines were previously on a double list, so the reduction is quite noticeable. Brown & Sharpe's list gives milling and gear carbon cutters as plus 40, also metal saws the same. A sharp advance is also noted in the same line for oil pumps, for which the demand is brisk at present. No. 1 pump, which has been selling for $9.50, has gone to the $11.20 figure, while the No. 3, B. & S. pump has jumped from the old mark of $13.75 to $16.10. Dealers admit that trade is good, but deliveries and transportation service are indifferent.

### Scrap Metals

The scrap situation is a rather uncertain matter at this date. Dealers are at sea on account of the recent embargo placed on the exportation of their line. Some of them seem certain that the ruling will be altered, but for the present it stands. No changes have taken place in the prices from last week, and there are no particular developments. The situation was explained by Mr. Knight, of Frankel Bros.: "If the embargo stays on it will mean lower prices in Canada for scrap metals. That much is certain. The consumers in Canada will take advantage of the fact that the dealers cannot sell his goods outside of Canada, and the result will be that the price will go down. Moreover," continued Mr. Knight, "the Canadian consumer cannot use all the scrap available in Canada at present. The outlook is uncertain. The prices quoted at present are correct enough, in that they represent the market value of the various lines, but we could not say to-day that we are in the market at those prices. In fact we don't want to buy much until this embargo situation is straightened out one way or the other." There is a considerable amount of scrap in the country, both in yards and from industrial plants. With

## POINTS IN WEEK'S MARKETING NOTES

**Government and private contractors in speed trial on building ships for United States war order. Result may decide future plans to be followed.**

**Canadian railways have been lifting many embargo rules, and traffic is now moving much more freely, the greatest improvement being at Black Rock and Buffalo.**

**An expenditure of $10,000,000 is called for to equip shops that have secured the new contracts for U. S. war orders.**

**U. S. Government is taking over machinery and machine tools originally bought by the Russian Government and made in U. S. shops.**

**All interest centres in probable action of U. S. Government authorities on fixing of iron and steel prices at end of present month. Drastic changes up or down are not looked for, but Government is urged to make price period long to give stability to market.**

**Canadian dealers in scrap metals in uncertain position over embargo put on against shipping out of country. They claim Canada cannot use all the scrap at present in country.**

the breaking of the weather it is moving more freely.

**Non-Ferrous Metals**

**Copper.**—There are few outstanding features in connection with copper trading. Although June 1 is some weeks away yet, the tendency is to watch and see what will happen on that date when the U.S. price agreement expires. No change in price is reported locally.

**Tin.**—The outstanding feature of the tin market is that it is scarce and hard to get. Canadian dealers find it hard to get much of it past U.S. officials, who are apparently always on hand to grab supplies that may be required for war business. Deliveries are not improving, largely on that account. In the general market some dealers claim that the way in which unfilled orders are piling up may have the effect of shoving up the price, but there are other influences that work against this.

**Spelter.**—Spelter is quoted here at $11, showing no price change. Small quantities of cheaper spelter are finding their way to the New York markets, but these are not sufficient to change values, and cannot be accepted as reliable indications of real values.

## TIME TESTS MADE TO DECIDE FUTURE PLAN

### Corporation and Government Speeding Up on Trial in Shipbuilding Programme

SPECIAL TO CANADIAN MACHINERY.

WASHINGTON, March 16. — Fully aroused to the needs of tonnage renewed efforts are being made to-day by the United States Shipping Board to speed up the shipbuilding program.

Within the past week information has reached Washington which shows that the program of United States must be materially speeded up if the full force of this nation and the Allies is to be felt by the enemy during the present year.

One of the first steps taken has been the proposal to construct several more shipways. It is not proposed to build any new yards, but to increase the capacity of the existing yards wherever possible. In order to make tests of the relative speed of government work and private work, the Shipping Board is now planning on taking over some of the contracts let to private firms to be carried out by the Government. It is the plan to take two ways, side by side, and let one work under a private contract and the other to be under Government operation. Time tests will be made and if it is shown that the Government can carry on the work as rapidly and as efficiently as the private concerns then all the contracts now in the hands of private concerns will be cancelled and taken over by the Government.

**Fewer Restrictions**

In order to help with the speeding up, the Shipping Board has let down the restrictions upon timber used for the wooden vessels under consideration. Specifications for the Ferris type ships which are being built call for long timber. It has been found that this timber is particularly hard to secure, while there is a great plenty of timber of shorter lengths. After tests it has been shown that the vessels can be built faster and as well with the shorter length of timbers. Consequently the specifications have been made to conform to the supply of timber.

**Concrete Ships**

Another step which has been taken in the speeding up program is the letting of contracts for concrete ships. As set forth in this letter some weeks ago the Shipping Board has been investigating the feasibility of concrete ships. This week the first concrete vessel was launched at a Pacific port. Reports on the vessel have been so favorable that Chairman Hurley of the Shipping Board has taken steps to lay as many keels as possible for ships of this type. Concrete vessels can be turned out of the yards in sixty days and it is hoped that by the use of this type of vessel that the shortage of tonnage can be tided over until all of the American shipyards begin quantity production. There is still some doubt about the length of service of these vessels, but the Shipping Board has taken the attitude that the vessels will earn their cost if they are able to make three trans-ocean voyages.

**Two Vessels Per Day**

According to Senator Fletcher of the Senate Commerce Committee, which has been making a thorough investigation of the shipping problems, vessels are now being launched in United States at the rate of one a day. He declares that within a short time the launchings will be at the rate of two a day. This estimate includes vessels of all types. On the Pacific coast four vessels have been launched this week, some of them of the large steel type, and wooden vessels are now being turned out in quantity by southern shipyards.

According to figures offered by the Shipping Board the production during the month of February was fifteen vessels with an aggregate tonnage of 114,100. Figures now in the hands of the Shipping Board show the estimated March production at twenty-three vessels, with an aggregate tonnage of 188,275.

**Coal from Alaska**

In order that the coal shortage may be relieved the Department of the Interior is making haste in preparing Alaskan coal fields for opening. It is announced that 19,000 acres of coal lands in Nenana field are now ready for lease and development.

Estimates of the bituminous coal output of the past week show a continued increase. The output for the week of March 2 was 11,055,000 tons.

**To Co-operate**

The establishment of a War Trade Board in Canada is expected to facilitate the shipment of goods between Canada and the United States and to work to the benefit of both Canadian and American manufacturers. It is expected that the Canadian board will work in close co-operation with the War Trade Board of United States and that the rulings of the two boards will follow along the same lines, and erase any possibilities of embarrassments to the manufacturers of either country.

Labor disputes which have threatened to hold up war operations in United States have been settled during the past week.

Admission is now made by officials that the aeroplane program of United States is lagging. According to an unofficial estimate the program is now 74 per cent. behind time. It is claimed, however, that this can be greatly decreased and that the fault does not lie with the manufacturers but is chiefly in the matter of shipment. It has been shown that shipments take ninety days from the factory to the front. Efforts are now being made to shorten this time and officials declare that by July United States will have sufficient aircraft to protect its own front.

**Steel Figures Rise**

Production of steel in United States is greater this week than for several weeks past according to reports here. Labor troubles are becoming less, reports show, and the lack of transportation is now

## INDUSTRIAL LEADERS POINTING TO CANADA'S BIG WAR PROBLEM

"It is only by exercising the greatest care and devoting earnest attention to the conservation of energy and materials in the employments most natural to Canada that manufacturers may hope to survive the pressure of low prices from foreign sources after the war. If labor is suddenly thrown out of employment, with their sources of food supplies gradually drying up, while many empty chairs in the home remind them of their sacrifices and losses, it will make a very serious situation in the country for manufacturers and Government."—Col. David Carnegie, Ordnance Advisor of the Munitions Board.

"After three or four years of war the affairs of the manufacturing industries of Canada are not wholly in a satisfactory condition. We already find the Governments making large inroads upon the profits of manufacturers through additional taxation. With labor conditions still very acute, we must bear in mind that further war orders will soon cease. It is now time to make immediate preparation to meet conditions after the war. This and other problems should receive the attention of every Board of Trade, manufacturers and corporations of all kinds, in order that they may not be allowed to drift."—C. A. Bogart, President Toronto Board of

practically overcome. Reports show that transportation facilities are nearer normal than for many months and it is hoped that within a few weeks conditions will be normal.

Action by Congress during the past week has made it possible to wipe out the German influence in American industry. Authority has been given for the sale of all German properties. It is planned to sell these properties to citizens of the United States and the end of the war will find Germany without a foothold in United States.

## RUSSIAN ORDERS GO TO U.S. ARMY NOW

### Large Amounts Being Put Out By Holders of New U. S. War Contracts

SPECIAL TO CANADIAN MACHINERY.

NEW YORK, March 16.—Manufacturers holding United States Government contracts for ordnance, projectiles, aviation motors and other war munitions are placing heavy orders for machinery, and, as additional contracts for guns, railroad equipment and ships are placed, a heavier strain will be placed upon manufacturers of machine tools. It is estimated that contracts for equipping manufacturing shops now pending will call for the expenditure of approximately $40,000,000. To carry out the Government's programme for increased manufacture of big guns it will be necessary to provide new facilities to manufacturers of large size tools, as present capacity of all such plants has been fully sold for the next twelve to eighteen months. The Ordnance Bureau of the War Department has called upon Congress for another appropriation of $400,000,000 to be used in the manufacture of heavy artillery. It is proposed to use a substantial portion of this sum to expand capacity of the plants of the present manufacturers of guns. Field artillery and shells up to 16 inches are to be produced and large purchases of machinery will be necessary for this purpose. One of the large ordnance plants in Eastern Pennsylvania is preparing to largely increase capacity.

#### A Million for Tools

The Wright-Martin Aircraft Corporation, which is manufacturing Hispano-Suiza aviation motors at its Simplex plant, will expend $1,000,000 for 500 tools, for which it has just issued specifications. The Symington-Anderson Co., Rochester, N.Y., is now to manufacture 1,000 75-mm. field pieces for the War Department instead of continuing the manufacture of 3-inch guns, called for by its original contract. To meet the new conditions purchases of machine tools will be necessary. The Remington Arms U.M.C. Co. is purchasing additional shop equipment for its Ilion plant for the manufacture of rifles. Many of the New England manufacturers of machine tools continue to receive supplementary orders from the five gun plants in that territory.

#### Use Russian Orders

The United States Government continues to take over much of the machinery and machine tools originally bought by the Russian Government for export as well as for the equipping of factories making rifles and munitions of the Russian type. It is believed that a thousand of such tools will become available to manufacture guns and shells for the United States Government. It is reported that 800 Russian tools held at one New England factory have never been used, and appraisal of the value of this machinery is being made. The probability is that these tools will be returned to the tool builders to be changed to meet the requirements of American shop practice. The Fiat-San Giorgio Co., Ltd., having ship and engine building plants at Torino and at Spezia, Italy, is endeavoring to purchase shipbuilding equipment in this country.

#### More Contracts

The Emergency Fleet Corporation has awarded several additional boat contracts in the last few days, the building of which will require about 25,000 tons of steel plates and shapes. The McDougall-Duluth Co., Minn., will build ten steel ships of 3,500 tons burden, two of which are to be delivered on June 1st, two on July 1st, and the remainder on or before May 15th, 1919. The Baltimore Drydock & Shipbuilding Co. has been awarded a contract for six steel boats of 6,000 tons each to be delivered from May to December, 1919; and the Hartman-Greiling Co. of Green Bay, Wis., will build two steam tug boats to be delivered by December, 1918. Six or seven ship-building plants are now in the market for various kinds of machinery.

It is estimated that the railroad equipment to be purchased by the United States Government for domestic roads will call for the expenditure of $1,000,000,000 to $2,000,000,000. Upon the basis that 150,000 cars and 2,500 locomotives will be ordered, the builders will call upon the steel mills in the next nine months for approximately 2,000,000 tons of steel. The equipment orders, however, will be placed probably in installments.

### CANADIAN GOVERNMENT WAR PURCHASING COMMISSION

**The following gentlemen constitute the new war Purchasing Commission. Sir George Foster, Minister of Trade and Commerce; Frank P. Jones, Montreal; J. W. McConnell, Montreal; James H. Gundy, Toronto; Charles McNaught, Toronto, and Joseph Gibbons, Toronto. C. A. Magrath, as Fuel Controller, and Hon. H. Laporte, as chairman of the War Purchasing Commission, are members of the board ex-officio. Sir George Foster is Chairman of the Board.**

## PITTSBURG MUCH INTERESTED IN PRICE

### Forecast from Steel Centre Does Not Indicate Much Change Either Up or Down

SPECIAL TO CANADIAN MACHINERY.

PITTSBURGH, Pa., March 16.—In current discussions of the iron and steel situation by producers, more reference is being made to the high level of costs that has obtained lately, in connection with the question soon to be settled as to what prices are to prevail after March 31. It is pointed out that costs are much higher than when the original price agreement was reached between the Government and the producers late last September. It is clear, however, that the producers are not using these arguments in expectation that higher prices will be granted, but rather as an offset to the expected request of the War Industries Board, at the meeting called for next Wednesday, that prices be lowered. The argument of the Government's representatives will be that the past three months have constituted an altogether exceptional period, on account of the traffic breakdown, and that no similar interruption to regular operation, entailing extraordinary production costs, is to be expected in future. The balance of probability remains strong that there will be no material alteration in the set prices. The period for which they will be extended is in doubt, and it is possible that no precise period will be named. Producers desire an extension to the end of the year, if not to the end of the war, and this would rather suggest that their private belief is costs will decrease rather than increase. No announcement is likely to be made until several days after next Wednesday's conference, as the War Industries Board will doubtless desire to consider the matter at some length, and the conclusion must then be submitted for the President's approval.

#### No Serious Complaint

Noting the fact that the complaints as to present prices are very far from general, and that the specific complaints relate to details of the relations between prices, the general conclusion may be reached that the price schedule as a whole is a more satisfactory one than it would be supposed could be drawn up. There is nothing about which there is not some complaint.

#### Traffic Conditions

Transportation conditions have continued to improve. In the past fortnight the improvement, on the whole, has been greater as to the movement of coke from the Connellsville region to blast furnaces than as to the movement of finished steel products from the mills. This means that intermediate products are accumulating to a still greater extent than formerly, and a complete restoration of shipping facilities at the steel

## PITTSBURG MUCH INTERESTED

(Continued from page 311.)

mills would result in the release of a very large tonnage, equal not simply to the current production, but to the production plus the stocks accumulated. Mill warehouses and yards are carrying a very large tonnage of finished steel, while steel ingots have accumulated, awaiting rolling into finished form, and there is also some accumulation of pig iron.

Connellsville coke shipments last week were 334,585 tons, against 297,000 tons in each of the preceding two weeks, and an average of 267,000 tons a week in the first nine weeks of the year. Car supplies in the coke region this week have been still better than last, indicating even larger shipments this week. At this rate the blast furnaces should soon be operating at full capacity, against about 80 per cent. at present and say 60 per cent. in January.

It is still the common view in trade circles that the only restricting influence in the matter of finished steel shipments from mills is the traffic situation, but there is some doubt about this. It is true that cars are scarce, no mill having a surplus, but there is the fact that shipping permits carry car supply with them, and shipping permits are granted only when the consignee applies. It is quite possible that some consignees are purposely refraining from applying for permits because they do not desire shipments just yet.

### Business on Books

At the beginning of this month the Steel Corporation had 9,288,453 tons of unfilled obligations on books. As the corporation's capacity is a trifle less than 45 per cent. of the country's total, and as the independents are at least as well filled up as the corporation, it may be assumed that the corporation's total of 9,288,453 tons represents between 40 and 45 per cent. of the total on the books of all producers, which would thus be 21,000,000 or 22,000,000 tons. A considerable part of this tonnage is represented in contracts upon which delivery will be long deferred and it is quite possible that some of the business will never be carried out. As a matter of fact the mills do not have specifications and definite shipping instructions for any large amount of business, except that due on war work. Customers in most cases would take more material than is being shipped them, but a little further loosening up in shipments, as is promised by the improving railroad conditions, would probably cause them to ask the mills to slow down on their deliveries.

In circumstances like these the finished steel market can hardly be described as a strong one. It is firm, as there are no concessions offered from the set prices. One of the strongest lines is sheets, there being few sellers for delivery in less than about ten weeks. Oil country goods are very scarce, buyers taking everything offered for early deliveries, while standard steel pipe is in better request. In plates, structural shapes, merchant bars and rails there is scarcely anything being done.

### Government Requirements

The Government's war steel requirements for the second half of the year are now being made up. The striking feature is the great increase in the shell making program indicated by the fact that the shell steel tonnage for the second half of year is placed at 2,500,000 tons, whereas the purchases made to date have totaled only 1,500,000 tons, for delivery to June 15, and many of these purchases were made five or six months ago. Shipbuilding will, of course, absorb more steel in the second half, and there will be heavy consumption of steel in car and locomotive building. The various items of steel that have been involved in new construction, on the other hand, will be largely out of the way, so that the total war requirements may not be greater in the second half of the year than in the first half. Some rough estimates may be made as a foundation, say, 400,000 tons a month of shell steel, 250,000 to 350,000 tons of steel for cars and locomotives and a like amount for shipbuilding, the last named item, however, increasing from month to month. Taking the three items roughly at 1,000,000 gross tons of steel a month, and adding 500,000 tons a month for miscellaneous needs of Government, together with requirements of the Allied Governments, there would be a total of 3,000,000 gross tons. Capacity may be estimated at 3,000,000 gross tons a month, in finished rolled steel. As there is little purely commercial or peace demand for steel, it is evident that if the steel industry is permitted by traffic and other conditions to operate at 85 or 90 per cent. of capacity, and there is special reason why it should not be, there will be an ample supply of steel. It will be only a matter of time until this fact is generally realized. There are many more who consider the condition a possibility than there were three months ago.

## RECENT PATENTS

THE following is a list of Canadian patents recently issued through the agency of Messrs. Ridout & Maybee, 59 Yonge Street, Toronto, from whom further particulars may be obtained: George W. Berry, combination cigar piercer, match ejector and indicator; James Dobson, means for obtaining the weight of railway rails, girders, beams and similar sectional lengths; Otis G. Gilbert, vegetable and dough cutter; Otto Higel, player-piano mechanism; John W. Anderson, apparatus for shaping metal channel bars; Robert E. Brown, vehicle top; Hans A. Christensen, digging machine; William E. H. Humphrys, cushion tire; Jonathan D. Loudon, spring centering attachment for automobile steering apparatus; Woodstock Electric Co., electric heater; Louis E. Barton & Henry A. Gardner, linoleum; Titanium Alloy Mfg. Co., rubber and methods of obtaining same; Toronto Type Foundry Co., Limited, wire reel.

## THE U. S. ZINC PRICES ARE NOW FIXED

### War Industries Board Acts On Advice of Federal Trade Commission

WHEN fixing zinc prices, the U. S. War Industries Board issued the following statement:

"After investigation by the Federal Trade Commission as to the costs of production, the President has approved an agreement made by the War Industries Board with the producers of grade A zinc, fixing a maximum price of 12 cents per pound f.o.b. East St. Louis, subject to revision on June 1, 1918, and also an agreement made by the War Industries Board with the producers of sheet and plate zinc f.o.b.. plant, and 15 cents per pound for sheet zinc f.o.b. plant, subject to the usual trade discounts.

"The conditions are: First, that the producers of grade A and of plate and sheet zinc will not reduce the wages now being paid; second, that they will sell to the allies, to the public, and to the Government at the same prices; third, that they will take the necessary measures, under the direction of the War Industries Board, for the distribution of the zinc to prevent it from falling into the hands of speculators who might increase the price to the public, and fourth, that they pledge themselves to exert every effort to keep up the production of zinc so as to insure an adequate supply so long as the war lasts."

## C. M. A. STATE THEIR VIEWS AT OTTAWA

### Want Duty Off Raw Material if it is Taken From Finished Product

ABOUT thirty-five of the leading manufacturers of Eastern Canada and as far west as Winnipeg formed a deputation which waited on the Government on March 14. S. R. Parsons, Toronto, president of the Canadian Manufacturers' Association, was the chief spokesman.

The delegation asserted that various changes and restrictions imposed upon industry had brought about considerable alarm among manufacturers, especially since it had been stated that what had already been done was nothing in comparison with what was in prospect.

A particular point raised by the delegation was that of opposition to farm tractors being placed on the free list, unless at the same time raw materials used in the manufacture of tractors in Canada were admitted duty free. The manufacturers also asked that in case of any further suggested changes in the tariff industries affected should first be consulted.

The manufacturers expressed a fear that as the recent regulations and restrictions on packers were much more drastic than those put into force in the United States they might result in a narrowed market for hogs and cattle.

In his reply Sir Robert Borden promised full consideration of the representations made.

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## ENGINEERING

London, Ont. [illegible] plant of T. M. Knowles Co. Loss, $15,000. Will rebuild. Require new machinery. Manager, Thos. Knowles, 36 Weston St.

**Highland, P.Q.**—The Montreal West Realty & Contracting Co., 347 Westminster Avenue N., Montreal West, have the general contract, and the Dominion Bridge Co., Dominion Station, Lachine, Montreal, the steel contract for the erection of a $11,000 addition in height to felt warehouse for the Standard Paint Co. of Canada, 52 Victoria Square, Montreal.

## MUNICIPAL

**Guelph.**—Gordon Street will likely be paved this season, and an oil tank built with a two-car capacity.

**Ottawa.**—The preliminary financial arrangements have been made for financing a $50,000 bridge across the Rideau.

**Brockville.**—The installation of switchboards and equipment is under consideration by the local Hydro-Electric Commission.

**Gananoque, Ont.**—About $15,000 will likely be spent by the council for extensions to the waterworks and sewerage systems. An electric pump may be included.

**Kingston.**—Electrical equipment will be purchased by the Utilities Commission to the extent of four k.w. transformers for the hosiery mill, and a meter for the Campbell power line. A transformer for the street railway will be purchased from the Canadian General Electric.

## GENERAL

**Kitchener, Ont.**—Ernest C. Getty, of Galt, has secured the three-storey factory building of the Kitchener Leatherette Co., on Water Street, and is fitting it up for a new shoe industry in this city.

## PERSONAL

**A. A. Maver**, master mechanic at the Grand Trunk Railway shops, Montreal, has retired at his own request, after a service of fifty-two years.

**William Cook**, the newly elected president of the Kingston Board of Trade, is superintendent of the Kingston branch of the Dominion Textile Co. and takes a [illegible] in the business development of that city.

Walter J. Francis, consulting engineer, of Montreal, has been elected chairman of the Montreal branch of the Engineering Institute of Canada, known until recently as the [illegible]ty of Civil Engineers. Arthur Surveyer was elected vice-chairman.

**George J. Fox** has been appointed superintendent of the Calgary division of the Canadian Pacific Railway, succeeding Paul F. Weisbrod, who is on leave of absence. Mr. Fox, who has taken over his duties, came from Schreiber, Ont., where he was superintendent.

**Capt. Ernest V. Moncrieff**, son of William C. Moncrieff, president of the Cataract Refining and Mfg. Co., has earned three promotions in the last year. He was appointed captain of the 102nd Ammunition Train last week. He was a member of Troop 1, and has already seen service in Mexico. The Cataract Refining Co., of which his father is head, have a Canadian office at 86 Don Esplanade.

**Paul T. Irvin**, who has been associated with the Wells Bros. Co., and the Greenfield Tap and Die Corporation for twelve years, has resigned his position as sales manager of the gauge division to accept the position of general sales manager of Lincoln Twist Drill Company of Taunton, Mass. Edward Blake, Jr. (formerly of Wells Bros. Co.), is vice-president and general manager of this company, and Frank O. Wells, president, and Frederick H. Payne, vice-president of the Greenfield Tap and Die Corporation are directors.

**Harold B. Chillas**, Toronto manager of the Standard Machinery and Supply Co., and the son of George Chillas, of Montreal, died at Toronto on March 11, after a brief illness. Mr. Chillas was apparently in good health a few days ago when he was in Montreal on business. He was thirty-nine years of age, and is survived by a widow and two children. His brothers are Ralph Chillas, who is overseas with the Canadian forces, and A. Shirler Chillas, of the staff of O'Brien & Williams, of the Montreal Stock Exchange.

**Collingwood.**—One of the early wooden shipbuilders of the Canadian lakes, William Andrews, died here on March 12, aged seventy-seven years. He was born at Clayton, N.Y., and when a boy came to Port Dalhousie, at which point his father established the Andrews Shipbuilding Yards, which were conducted by the family until the construction of the new Welland Canal, which took up their property. Later Mr. Andrews moved to Welland and then to Port Robinson, coming to Collingwood to continue wooden shipbuilding with his brother, Stephen D. Andrews, who was one of the originators of the shipyards now owned by the Collingwood Shipbuilding Company. During the operations of the Andrews' yard on the Welland Canal, William Andrews took part in the construction of many vessels, among others the steamers Zimmerman, City of Toronto (afterwards the Algoma), Alma, Munro, Isaac May, Lake Ontario and Silver Spray. While at Collingwood he was engaged on the Majestic, Germanic and others. He is survived by his wife and his brother, who is Dominion Inspector of Hulls, with headquarters at Collingwood.

## BUILDINGS

**Montreal, Que.**—As the result of a fire which broke out on March 11 in the premises of the Samuel Fisher Co., engineers' supplies, 57 St. Sulpice street, damages to the extent of over $25,000 was done to the contents of the building, while the building itself, which belongs to the Hotel Dieu, is practically a total loss.

## CONTRACTS

**Three Rivers, Que.**—The City Council has awarded a contract to Oliver & Co., Montreal, for a five-ton crane for the new pumping station.

## MARINE

**Oakland, Cal.**—Three new 9,400-ton steel merchantmen were launched at Oakland, California, yesterday.

**Halifax.**—Capt. Fred J. Trotter, of Amherstburg, has been awarded the contract for raising the Canadian lightship Faulken.

**Detroit.**—The U.S. lighthouse tender, Aspen, recently reported seeing an iceberg in Lake Erie about 25 feet high and 200 feet square drifting before the wind towards the mouth of the Detroit River.

**Vancouver, B.C.**—The wooden steamer War Selkirk was launched at the Western Canada Shipyards on March 6. Mrs. W. A. Armstrong christened the vessel, which is the fifth being constructed for the Imperial Munitions Board.

**Prince Rupert, B.C.**—All work at the big dry dock here has been ordered shut down. Although no official announcement has been made, it is stated this move foreshadows the leasing of the plant to American interests.

**A Pacific Port.**—So successful was the launching here of the world's largest reinforced concrete ship that her builders announced they immediately would begin construction of fifty-four similar ships of larger size, and expected that all would be completed within eighteen months.

**Toronto.**—The city has been given permission by the Private Bill Committee to make a temporary $1,750,000 loan to the Harbor Board. The City Solicitor said the board planned to spend between $12,000,000 and $14,000,000, but was held by its contract with the Canadian Stewart Co. to provide this amount.

**Midland, Ont.**—Seven car loads of steel reached the Midland shipbuilding yards during last week to be used in the con-

# The A. R. Williams Machinery Co., Ltd.

**64 West Front Street** **Toronto, Canada**

*If any advertisement interests you, tear it out now and place with letters to be answered.*

struction of new vessels and in repair work. The company has been seriously inconvenienced by lack of materials, but conditions are gradually improving.

**Winnipeg, Man.**—The report that F. Hutchings of this city will establish a shipbuilding plant at or near Vancouver has not been confirmed, although it is understood that Mr. Hutchings will have no trouble in obtaining a contract if [illegible] can be obtained from the Federal Government.

**Victoria, B.C.**—That a syndicate of New York capitalists is prepared to establish a ten million dollar shipbuilding yard in the vicinity of Victoria was made known in a letter received last Thursday by the Board of Trade, and referred to the city council. It was stated that the construction of the plant contemplated would involve an expenditure of between $8,000,000 and $10,000,000.

**Detroit.**—"In comparison with the same period last year, there is about the same quantity of ice in Lake Superior, less in Lake Michigan, about the same quantity in Lake Huron, less in Lake Erie, and more in Lake Ontario," says the second ice bulletin of the season, issued by the United States Weather Bureau. On comparison with the ten-year average there is nine inches more of ice at Duluth, seven more at Sault St. Marie, thirteen more at Mackinaw, and eight at Escanaba.

**Ottawa.**—With the arrival of the steamer War Viceroy at London on Feb. 16, with a cargo of wheat from Vancouver via the Panama Canal, the first stage has been completed in an experiment which may have far-reaching benefits for the great grain-producing areas of Western Canada. The War Viceroy cleared from Vancouver on November 14 last for Nanaimo, whence she sailed on the 16th, making a call at Portland. She had 100,000 bushels of wheat on board. A full report is expected in due course from the special officers who accompanied this shipment to England.

**Washington.**—Naval experts anticipate an unfavorable report from the board headed by Rear-Admiral Albert G. Winterhalter, which has just completed tests of the former Austrian steamer Lucia, which has been equipped with interior "buoyancy boxes" designed to make her unsinkable. That the ship will remain afloat after receiving injuries which would sink a craft of ordinary construction is conceded, but constructors are of the opinion that the "buoyancy boxes" would not prevent a torpedo damaging the vessel to such an extent that she would be of no further value as a supply ship or cargo carrier.

**Vancouver, B.C.**—The Wallace shipyards will launch the steel steamer War Power about the middle of March, according to a statement to-day by A. Wallace. The vessel is a sister ship to the [illegible] May 17 last. [illegible] cargo vessel [illegible] Columbia. [illegible] keel for [illegible] dead- [illegible] yard proposes to build at least two new slipways, and possibly three, and on these additional ways will construct the four 5,100-ton steamers recently ordered by the Dominion Government.

**North Vancouver, B.C.**—This city had a most encouraging programme in shipbuilding last year and launched one steel steamer and six auxiliary schooners. This year will see six wooden steamers and several steel steamers sent into the water and the industry has meant a great deal to the north shore city. Last year's launchings were the steel steamer War Dog and the five-master auxiliary schooners, Mabel Brown, Janet Geraldine Wolvin, Jessie Norcross, Janet Car ruthers. Mabel Stewart and Marie Barnard. The War Puget heads the 1918 programme with five other wooden steamers to follow from the Lyall yard and several steel steamers from the Wallace yard; the ambitious city will have good cause to congratulate itself on doing its bit in solving the tonnage problem.

**Vancouver.**—The Standard Shipbuilding Co., with offices in the Dominion building, has just closed contracts with Sir Joseph Maclay, head of the Imperial Shipping Board, for ten composite steamers, which will be built at Ruskin, near the junction of the Stave River with the Fraser. Negotiations have been in progress for some time, and Patrick J. Donohoe, naval architect, will be superintendent of the plant. His designs for the vessels have been approved, and a representative of the company is now on his way to London with the final plans, according to a recent announcement. By March 20 at least 200 men will be at work preparing the site and the building ways, and by next month at least eight keels will have been laid, it was stated. The company has 2,200 feet of frontage on the Fraser River, and already has a sawmill, a machine shop and a smithy in operation. The vessels will be 281 feet long, 48 feet beam and 27 feet deep, will have a speed of ten knots loaded, and a deadweight capacity of 3,500 tons.

# TENDERS

**Kitchener, Ont.**—Tenders are being called for the erection of a $12,000 factory addition for George Schlee, 30 Edward Street. Architect, Charles Knechtel, 31 Courtland Avenue W.

**Ottawa.**—Tenders addressed to the chairman and members of the Board of Control will be received by the secretary, City Hall, Ottawa, up to 4 p.m. Thursday, March 21, for motor driven street flusher.

**Sifton, Man.**—Tenders for "Grading Roads" and laying concrete pipe culverts will be received up to Tuesday, April 9th. Plans and specifications can be had on application to R. Hockin, Sec.-Treas., Oak Lake, Man.

**Ottawa.**—Tenders will be received until Monday, March 18, for the construction of structural steel work, Dominion Government office building, Ottawa. Plans and forms of contract can be seen and specification and forms of tender obtained at the offices of the Chief Architect, Department of Public Works, Ottawa, the Overseer of Dominion Buildings, Central Post Office, Montreal, P.Q., and the Clerk of Works, Postal Station "F," Toronto, Ont.

**Melbourne, Australia.**—Tenders for the following may be addresed to the Director of Navy Contracts, Navy Office, Melbourne: Supply, delivery and erection at Garden Island, of one (1) 200 horse-power prime mover set of either semi-Diesel type or other heavy oil engine direct coupled to 2-65 K.W. 240 volt D.C. electric generating set. All accessories, tank and fittings to be supplied by tenders as per specification. Date of closing, June 7, 1918. Tender forms are open for inspection at the Department of Trade and Commerce, Ottawa. File No. 20117.

# INCORPORATIONS

**The Nepigon Reserve Iron Co., Ltd.,** has been incorporated to explore, develop mines and mineral lands, etc. The capital is $375,000, and head office is in Toronto. Provisional directors are J. U. Newcombe, F. E. Abbott, J. R. L. Starr, L. M. Heal and E. Staples .

**The Auto Oil Co., Ltd.,** has been incorporated in Toronto, with authorized capital of $250,000, to develop and work gas and oil lands, and to operate in mineral lands, etc. The provisional directors are B. T. McAvoy, E. Barry, L. Sleeth, B. A. Clark and D. O'Connell.

**The Geo. F. Foss Machinery & Supply Co., Ltd.,** has been incorporated at Montreal, to do business as engineers and engine manufacturers, general contractors, bridge builders, boiler makers, machinists, tool makers, etc. Letters were granted to G. Davenport, L. Delarge, L. Potvin, J. Bernier, A. David.

**The Canadian National Carbon Co., Ltd.,** has been incorporated at Toronto, to deal in calcium carbide, and all gas producing materials and gas, especially acetylene gas, and machinery, etc., for purposes relating to the process. The incorporators are: H. Harrison, barrister-at-law, R. E. Laidlaw, W. Robertson and S. D. Gardiner, students-at-law, and J. F. Van-Lane, accountant, all of the City of Toronto.

**Crane, Ltd.** is the name taken in incorporating at Montreal a company to manufacture, merchandise, buy, sell and in every manner deal in and with all kinds of steam, gas, water, oil, mine, mill, foctory engineers; plumbers; railways, hardware and builders' supplies and materials of all kinds and agricultural machinery and supplies, and to carry on a general engineering business. The incorporators are E. G. Bennett, A. B. Wright, C. Arnold, A. Charers and A. Mathieu.

**Knight Metal Products Ltd.,** has been incorporated at Toronto to manufacture, sell and deal in iron, steel and other metals, to carry on in all its branches the business of an engineering, repair and construction company and to carry

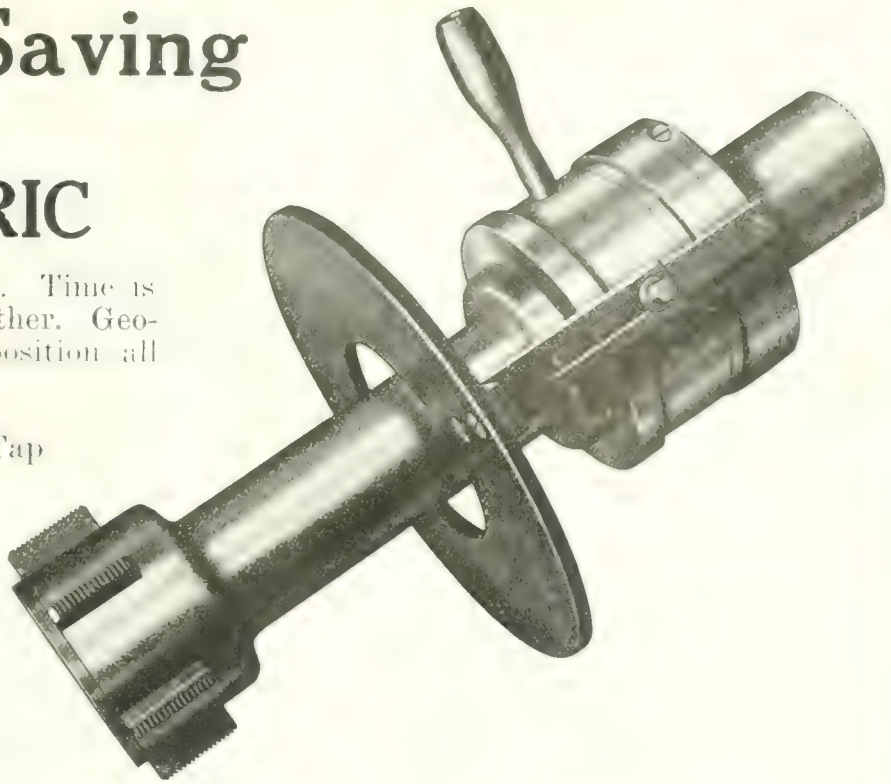
## with a

# GEOMETRIC

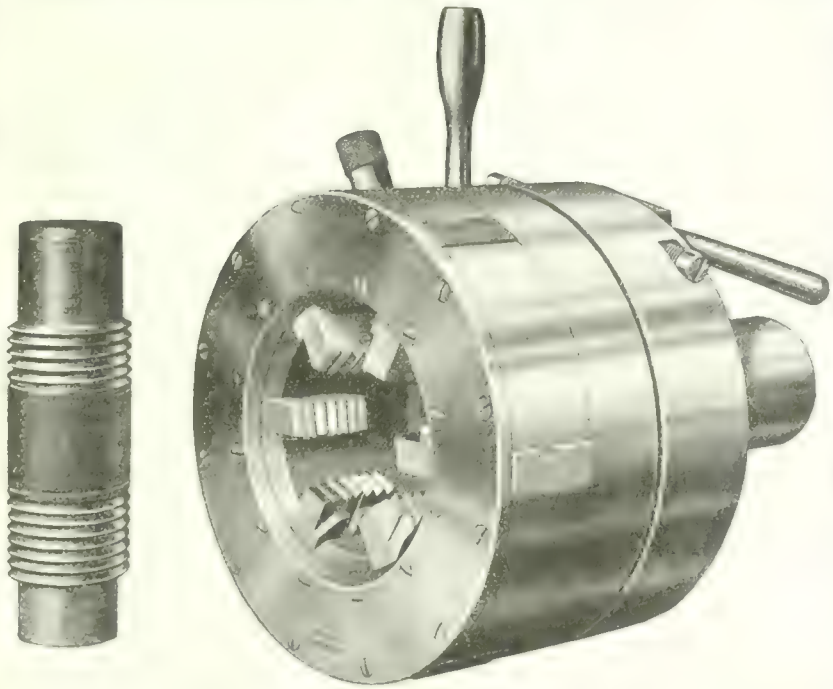
That is what it amounts to. Time is not the only thing saved, either. Geometrics are a saving proposition all around.



This Geometric Collapsing Tap is specially arranged for deep tapping in Projectile Caps.

All classes of thread tapping above $3_4$-inch diameter are taken care of by Geometric Collapsing Taps.

***Twenty-five years of specializing in Screw Thread Cutting Tools has made the name GEOMETRIC stand for all that could be asked in Screw Thread Production.***



When it is an outside thread, Geometric Die Heads cut every style from 1/16-inch size up to greatest required diameter.

A U.S. Navy Yard is using this 4½-inch size Style "D" Geometric Die Head. United States Navy Yards accept no second quality.

Do your Screw Machines and Turret Lathes swing Geometrics?

You have as much right to Geometric benefits as any other manufacturer.

## The Geometric Tool Company, New Haven, Conn., U.S.A.

***Canadian Agents:***

Williams & Wilson, Limited, Montreal. The A. R. Williams Machinery Company, Limited, Toronto, Winnipeg, St. John, N.B.

on the trade or business of iron makers, steel makers, steel converters, smelters, engineers, tin plate makers, munition manufacturers, iron founders, repairs, etc. The incorporators are J. S. Lovell, A. [illegible] K. C., J. J. [illegible]wood and J. Henry, all of Toronto.

## TRADE GOSSIP

**Want Supplies.**—McDougal Bros. of Besserer St., Ottawa, wants to purchase 2 locomotives, 12 to 15 tons, 36 in. gauge; 15 four-yard dump cars, 36 in. gauge, [illegible] derrick on low broad [illegible] and 70 tons of 40 lb. re-laying rails.

**Will Make Sales.**—A firm, composed of Toronto people, has been incorporated under the name of the Bisco Doll Co., Ltd., with capital of $40,000, to manufacture dolls, toys, etc., and deal in same. Provisional directors are M. Magi, M. Hands and W. H. Davis.

**Moved to New Plant.**—The Curtiss Aeroplanes and Motors, Ltd., have removed from 70 Pearl St., Toronto, to their new premises, (formerly occupied by the Toronto Furniture Co.,) at 163-189 Dufferin St., Toronto.

**To Increase Capital.**—The Ottawa Gas Co. will apply to the Parliament of Canada, at the next session, for an Act further amending its act of incorporation by increasing the capital of the company to $5,000,000.00, and by increasing the borrowing powers of the company.

**Winnipeg, Man.**—Tenders for structural steel ornamental lamp posts for the Provencher Ave. Bridge, addressed to J. B. Cote, secretary of the Joint Committee, St. Boniface, will be opened on March 28. Plans and specifications to be obtained from the Bridge Engineer, 802 Confederation Life Building.

**Montreal, Quebec.** — The Canadian China Clay Co., St. Remi d'Amherst, has just shipped the first carload of fire brick to the Canadian Steel Foundries at Welland, Ont. A plant for producing silica sand for cast steel molding and furnace sands, organized by Prof. Bell of McGill University, has been started in the same vicinity.

**Business as Usual.**—The Samuel Fisher Co., 57 Surplice Street, Montreal, had a bad fire in their premises, damage to the extent of about $25,000 being done. Considerable of the damage will come from the rusting of material. Temporary offices have been secured next door, and business will be carried on as usual. The question of a new location has not been settled.

**A New Proposal.**—Several replies were received from Brantford manufacturing firms at the city hall relative to the request of the civic finance authorities to do away with fixed assessments for the duration of the war. Some of the replies were favorable and others were not, and the whole matter will be again taken up in committee before the tax rate is struck for the year.

**Vancouver, B.C.**—A. F. Proctor, Provincial Government engineer, announced last week that he hoped to have the Pacific and Great Eastern Railway constructed to Williams' Lake, and even 120 miles further, to Soda Creek, this year. If it is possible to push the construction to Soda Creek it will mean that water and rail transportation will be opened between Fort George and Vancouver.

**Montreal.**—The War Trade Board of Canada has been successful, it is understood, in making an arrangement with the War Trade Board of the United States whereby the fruit, vegetable and fish canners of Canada will be enabled to obtain supplies of tin plate from the United States at a price which will approximate to the price of $7.75 per base box of 300 pounds now paid by American canners.

**Ottawa, Ont.**—Tenders will be received until Tuesday, April 2, 1918, for the construction of a Dominion Government Office Building, O'Connor street, Ottawa, Ont. Plans and forms of contract can be seen and specifications and forms of tender obtained at the offices of the Chief Architect, Department of Public Works, Ottawa; the Overseer of Dominion Bldgs. Central Postoffice, Montreal, and the Clerk of Works, Postal Station "F," Toronto, Ont.

**Winnipeg.**—A regular examination of applicants for license as Steam Engineers under "The Steam Boiler Act" for the Province of Manitoba will be held in the Legislative Chambers, Parliament Buildings, Winnipeg, on Friday, March 22nd, 1918, commencing at nine (9) o'clock a.m. Address all communications and make all money orders and cheques payable to the Bureau of Labor, 301 Boyd Building, Winnipeg.

**Sydney, N.S.**—J. C. Watters, before leaving for Inverness and Stellarton, where he will endeavor to patch up differences between the coal companies and miners at these places, said that following an interview he had with Mr. Adams, manager of the Scotia, the wage and union questions had been settled to the satisfaction of both the men and their employer. The steel workers had threatened a strike, and previous to the arrival of Mr. Watters the situation was critical.

**Winnipeg.**—The official announcement is made that the Winnipeg Electric has decided to put on a motor 'bus service in Winnipeg to compete with the jitneys. The contract has already been let for the first 'buses. These will run on residential routes, and will give and accept transfers from street cars. The announcement is making a big stir in the city, and the opinion is freely expressed that the company has adopted the most efficacious method of dealing with the situation.

**Extend Line to Toronto.**—The T., H. & B. Ry. will apply to the Parliament of Canada at its next session, for an Act authorizing the extension of its railway from its present north-westerly terminus at Hamilton to a point in or near Toronto; also authorizing it to make and enter into with the Canadian Pacific Railway Company and the Grand Trunk Company of Canada for a term not exceeding 21 years any of the arrangements or agreements authorized to be made between railway companies by section 364 of the Railway Act, and for other purposes.

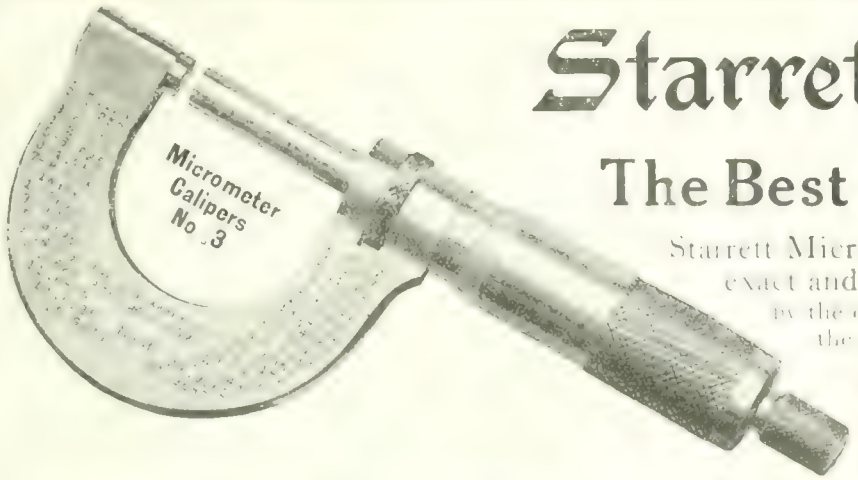
**Export of Rods, Sheets, Plates and Bars Prohibited.**—An order-in-council has been issued from Ottawa prohibiting the exportation from Canada of the following goods except under license issued by the Minister of Customs, at the request of the War Trade Board:—Abrasives and all materials entering into their manufacture, ammonium sulphate, calcium carbide, electrodes, machinery, chemical wood pulp, mechanical wood pulp, newsprint paper; iron or steel, comprising wire rods, wire, plain or galvanized, or otherwise coated; sheets, plates, bars.

**The R. H. Howes Construction Co.,** of Boston and New York, has established a shipyard at Meteghan River, N.S. A lease for a term of years has been taken of the late James Cosman's shipyards at the mouth of the Meteghan River. Mills, together with pattern shops, equipped with the latest improved machinery, have been erected and are now working. The company recently closed a deal for a tract of 500 acres of very valuable timber land on the Meteghan River and intends to enter into shipbuilding on a very extensive scale. It already has one schooner entirely in frame and other keels will be laid immediately.

**Ottawa, Ont.**—Tenders will be received until April 11, 1918, for the switchboards, panel boards and transformers required in the construction of the Parliament Buildings. All tenders to be based on the execution, completion, and delivery on the site, together with the furnishing of all material, tools, appliances, labor, etc., for the work as required and described by the plans and specifications for switchboards, panel boards and transformers. Plans and specifications and any other information required can be obtained at the office of the general contractor, P. Lyall and Sons Construction Co., Ottawa.

**New Bridge at Niagara.**—The Canadian Niagara Bridge Co. will apply to the Canadian Parliament for incorporation with power to construct, maintain and operate a railway and general traffic bridge across the Niagara River, with the necessary or proper approaches and terminal facilities, from some point in the Township of Bertie or in the Township of Willoughby, in the County of Welland, and to charge tolls for the passage of engines, cars, vehicles, pedestians and general traffic over the bridge approaches and terminal property or for the use thereof. The head office is in Hamilton, Cahill & Soule acting for the applicants.

**World's Aluminum Output.**—The world production of aluminum has increased 20 fold since 1900, while that of tin has scarcely doubled meantime. Aluminum production in 1900 was 7,200 tons and in 1916 135,000; tin production in 1900 77,200 tons, and in 1916 117,500. Of the



# Starrett Calipers

## The Best Money Can Buy

Starrett Micrometer Calipers have a more exact and easier way of adjustment than by the old method of a movable anvil. Over the barrel is a thin, graduated sleeve, and on this sleeve is the zero line, instead of on the barrel itself. The thin sleeve keeps dirt from the screw and after years of use a turn of this sleeve brings the zero line correct to

For measurement by thousandths up to one inch. Has lock nut and ratchet stop, or can be furnished with lock nut at end of frame.

### Compensate for Wear

A knurled locking nut contracting a split bushing around the spindle tightens and keeps the spindle central and true, or by a slight turn locks it firm, making a good gauge when desired. Anvil and spindle are hardened, ground and lapped.

### VERNIER CALIPERS

Graduated in either or both English and Metric divisions for outside and inside measure—warranted accurate. Points are on the beams and slides for setting dividers to transfer distances. Jaws are carefully hardened and accurately ground. A finely finished plush-lined case, unless otherwise ordered, is sent with each caliper as well as full directions for using.

output of aluminum in 1916 approximately 62,000 was the product of the United States, 20,000 produced in France, 16,000 in Norway, and 8,000 in Canada. Figures differ radically as to Great Britain, ranging from 4,000 to 12,000 tons production. In Switzerland the normal product is about 20,000 tons, but has been materially reduced by inability to obtain from France the bauxite from which aluminum is produced

**Ottawa, Ont.**—Tenders will be received until March 28, for rolled steel casements and bronze-covered frames and sash for the Parliament Buildings. All tenders to be based on the execution, erection and completion; together with the furnishing of all materials, tools, appliances, labor, etc., as required and described by the plans and specifications for (a) rolled steel casement; (b) bronze covered frames and sash. Separate tenders to be submitted for "a" and "b." The work included under this contract shall be commenced immediately on the signing of the same, or at such time as may be directed, and be carried out in such a manner as to insure the completion thereof by Sept. 30, 1918.

**Ottawa, Ont.**—Tenders will be received until Tuesday, March 26, 1918, for the construction of fifty-one (51) section houses at various points on the Canadian Government railways (National Transcontinental Railway) between Moncton and Winnipeg. Plans, specifications and blank form of contract may be seen at the following offices: Chief Engineer Dept. of Railways and Canals, Ottawa, Ont.; Chief Engineer, Can. Dept. Rys., Moncton, N.B.; Resident Engineers at Edmundston, N.B., Levis, P.Q., Quebec, P.Q., Cochrane, Ont., Fort William, Ont., the Terminal Agent, Montreal, P.Q., the General Western Agent, Toronto, Ont., and the General Manager Western Lines. Winnipeg, Man.

**Rushing Work At Ft. William.**—The Canada Car and Foundry Co. of Fort William have their plant in shape now, and the capacity is up to the point where it is possible to turn out a completed freight car every 20 minutes. This huge car factory, which is now working on an order for 5,000 cars for the Canadian Government railway, is located in west Fort William. Twelve hundred workmen are now employed. It is one of the most modern factories in Canada, being built exclusively of brick, steel and glass. Power is derived by the use of huge producer-gas engines. Contracts have been let for a shipbuilding plant to be erected on a site adjacent to the factories shown above, the company having received large orders to build mine-sweepers for one of the Entent powers.

**Looks Good.—The "Scientific American"** tells us that Bradford, England, has been operating a municipal trackless trolley since June, 1911, and finds a number of advantages in such a system as compared to regular trolley lines. There are now in Bradford 9½ miles traversed by the trackless service, and in 1916 there was a car mileage on such routes of 322,300. Eighteen cars were operated and the total operating cost, including interest and sinking fund charges, was 15.5 cents per car mile. The number of passengers carried was 3,402,985. The average fare per mile was 1.3 cents, fares being rated according to the distance travelled. Each car seats twenty persons, and is run by a motorman and conductor. The current is obtained from overhead trolley wires and the vehicle runs upon the pavement on solid rubber motor truck tires.

**Bond Engineering Works Ltd.**, who recently took over the plant of the Queen City Foundry, announce that they are about to construct another addition on to their foundry located in the harbor industrial district at Toronto. In the new building will be a core room; cleaning and grinding room; and storage for foundry supplies; coke; moulding sand, etc. Facilities will also be provided for babbitting, painting, and assembling of the line of power transmission specialties which they will manufacture. Modern equipment of the best type will be installed, to facilitate the efficient handling of raw materials and the finished product. Special attention is being given to the welfare of the employees; in the way of light, heat and ventilation. An adequate system of dust collectors is one of the improvements contemplated. The locker room is to contain a locker for each employee; and shower baths; wash basins; drinking fountains; etc., will be provided.

**U.S. Steel Corp. Unfilled Orders Decline.**—The U.S. Steel Corporation reports that unfilled orders on hand Feb. 28, 1918, amounted to 9,288,453 tons, as compared with 9,477,853 tons on January 31, a decrease of 180,400 tons. Unfilled orders on hand Dec. 31, 1917, amounted to 9,381,718 tons; on November 30, 8,897,106 tons, and on February 28, 1917, 11,576,697 tons. The shrinkage of 189,400 tons in the unfilled orders of the United States Steel Corporation in February reflects the absence of buying on the part of domestic consumers. The Steel Corporation has a capacity for shipping over 55,000 tons of finished steel daily, but as a result of inadequate transportation facilities, shipments in February could not have averaged much more than 60 per cent. to 65 per cent. of capacity. In view of this, total incoming orders of United States Steel last month could not have been much more than 50 per cent. of capacity.

**Wasteful Coal Mining in Canada.**—Speaking on the waste of coal in Canada, before the Canadian Mining Institute at Montreal, W. J. Dick, Sydney, C.B., said a large proportion of the coal mined in Canada was lost or wasted owing to the practice of mining lower seams of better quality first, with the result that by the caving in the recovery of coal from the upper seams was generally impossible. In other countries leases were granted only on satisfaction being given the authorities that a proper

scheme of operations was to be carried on. In Canada there was indiscriminate leasing of coal lands without restrictions, and if the mines were worked to their capacity the output would be 16,000,000 tons per annum. He depreciated the opening up of farmer or "snowbird" mines, about 400 of which had been abandoned in Alberta alone, as they not only destroyed the entrance to a coal field for large operations, but were a menace to safety in the workings.

## REFRIGERATION

**Vancouver, B.C.**—With a view of placing British Columbia deep-sea fish on the prairie markets, a company has been formed to operate cold storage plants on this coast. This concern will be known as the Union Fisheries & Cold Storage Co. Already a contract has been let for laying down the first plant, which will be located at Clayoquot, on the West coast of Vancouver Island. The capacity of this factory will be 1,000,000 pounds of fish, and the company contemplates constructing two other factories. One of these will be on the east coast of the island and the third at Prince Rupert. George Brown is president of the company.

## CATALOGUES

**Bakelite Micarta Gears.**—Technical information regarding Bakelite Micarta D gears is contained in a pamphlet, A-2132, recently published by the Westinghouse Electric and Manufacturing Co. of East Pittsburgh. The distinctive features of this material for noiseless gears and pinions are listed together with its physical properties. Methods of turning and drilling and gear cutting are described and illustrated with many half-tones and drawings. Methods of attaching to the driving shaft, which have proved suitable for gears of all sizes, are shown, and tables of pitch, teeth and other gear data are also given. There are formulas for the horse-power rating, the amount of power which can be transmitted through press fit and for calculating other variables in gear practice. The book, which is of twelve pages, is a valuable addition to the library of anyone who has to do with noiseless gears. It will be sent on request to the company's nearest office.

## LOCOMOTIVES INCREASE IN SIZE

THE size of locomotives has increased in less than ninety years from the four and one-half tons of Stephenson's "Rocket" of 1829 to the 380 tons of the latest Mallet articulated freight locomotive. Captain H. R. Sankey, English engineer, finds that in Great Britain the growth was fairly rapid until 1870, when it had reached forty tons, but there was then a pause until 1897; followed by an increase to eighty tons by 1914. The latter size is believed to be the maximum practicable for passenger locomotives under the conditions of the country. In the United States passenger and freight locomotives were of nearly the same

Money as a Munition of War

Charles H. Sabin, Head of the largest Trust Company in the World, Advocates Credit Expansion.

"Business men and wage-earners cannot lend money to the Government unless they can make money. And business must earn more money this year than last year.

"Increase in prices resulting from expansion of credit gives industry a stimulus. Extra demands of government finance and increased industrial needs absolutely require expansion of credit."

Thrift: Production: Expansion.

The two quotations and the three words above are point from the most forceful and constructive address on finance in war time that has been written since the outbreak of the conflict. The author is by Charles H. Sabin, president of the Guaranty Trust Co. of New York, and you can read it in THE FINANCIAL POST this week. It is very much worth your attention. Not only is Mr. Sabin head of the greatest Trust Company in the world, but his understanding and knowledge of the fundamentals of business in relation to finance mark him out as an authority of whose words you can rely. Read this article. Act on its advice. Improve your business by the knowledge you gain.

THE FINANCIAL POST This Week

Business interest this week is focused on several important matters, one of which we deal with in THE FINANCIAL POST under head such as the following:

C.P.R. Earnings Will be Less Under Tax.
U.S. Munition Orders to Right our Exchange.
Regulation of Packers Will Hit Industry.
Western Soil in Better Shape This Year.
Royal-Northern Crown Bank Merger Raises Query.
Bank Clearings 7½ Ahead of Last Year.
Banks May be Forced to Close Earlier.
Should Bank Managers Act as Solicitors?
Judges Charged by Officer of Loan Co.
Saskatchewan Tax System is Inadequate.

# Chilled Iron Dies

FOR MAKING

# 75-mm. Shell Forgings

Our Chilled Iron Dies for nosing the various sizes of Shrapnel and H.E. Shells, have proven so entirely satisfactory in use in our own shops and in the shops of our many customers that experiments have been made to try out this same material in the making of Shell Forgings, and we are happy to be able to announce that Chilled Iron has proven equally as satisfactory in the making of the Shell Forgings as in the forming of the nose on the shell.

We are now supplying regularly Chilled Iron Drawing Dies and Chilled Iron Piercing Dies for making the forgings for 75 mm. shells.

Chilled Iron Dies are harder on the wearing surface than tempered steel. They are chilled or hardened to the same extent over the full wearing surface, but are soft and easily machined elsewhere. That is why they last so long. We ourselves have nosed 40,000 shells with one die.

# Back to Boiler

## AS PURE HOT WATER

That's where the condensation in your steam lines should go—immediately back to your boiler as pure, hot feed water. That is where and how it will go the day you install Morehead's Back-to-Boiler System. The economy in fuel cost alone is at least 8%, and the increased efficiency of steam-heated machinery is another big consideration. Write for the Morehead Book on Steam to-day.

weight up to 1895, but the latter have doubled in weight since that time. The great Mallet engine has six cylinders, the tender, as well as the boiler, assisting in giving adhesive weight. The tractive effort of this engine, 166,000 pounds, is nine times that of the most powerful British locomotive, but the opinion is expressed that it may be further increased to 300,000 pounds. A Mallet locomotive of only three tons, built in France in 1887, is an interesting contrast.

### FORTUNE IN WORNOUT TIRES

According to the statistics of a rubber expert the world discarded 183,000 tons of automobile tires during the year 1916. Adding to this the large number of bicycle tires thrown away every year by their owners, it appears that the world spends, every year, at least $600,000,000 for pneumatic tires alone. During the last automobile exposition in New York it was pointed out that nearly 5,000,000 automobiles are now in use in the United States. To supply these with tires, nearly 80,000 tons of indiarubber are needed every year, and the American automobile owners pay every year as much as $200,000,000 for their tire bill.—"Scientific American."

### LONDON MAN PRESIDENT OF HYDRO ENGINEERS

**Officials of Municipally Owned Electric Utilities Admitted to Membership in Organization**

THE engineer's section of the Ontario Municipal Electric Association has been reorganized to include in its membership officials of all the municipally-owned electric utilities in Ontario, in addition to officials of the local Hydro-Electric bodies.

Officers elected for the ensuing year are as follows:

President, E. V. Buchanan, London, Ontario; vice-president, E. I. Sifton, Hamilton, Ontario; secretary, S. R. A. Clement, Hydro-Electric Power Commission, Toronto; treasurer, R. C. McCollum, Hydro-Electric Power Commission, Toronto; chairman of standing committees, Oswald H. Scott, Belleville, Ontario; V. S. McIntyre, Kitchener, Ontario; E. J. Stapleton, Collingwood, Ontario; R. H. Martindale, Sudbury, Ontario.

The first meeting of the reorganized association will be held at Niagara Falls on June 14 and 15, 1918.

# Repair and Maintenance of Locomotives in War Time

By E. R. Battley

*The conditions under which locomotive engineering is carried on to-day are beyond all precedent. High wages, much inexperienced help and dearness does all possible to all tend to make the repair and maintenance of locomotives a great problem, and one which cannot be side-tracked. The methods outlined by the author indicate measures which are found necessary and desirable in taking care of motive power.*

REPAIRING and maintaining running repairs on locomotives are two of the great problems with which railroads have to deal. On account of the abnormal conditions and the vast amount of freight waiting to be moved, it is essential that railroads keep their engines in constant service, and in dealing with this problem at the March meeting of the Canadian Railway Club, at Montreal, the author laid emphasis on the fact that due to the demand for locomotives in the Allied countries our locomotive builders cannot supply sufficient new engines for export and for home use, therefore it has been deemed advisable to ship a large part of the output abroad, using our present power to its capacity. By so doing we must expect the outlay for repairs will be in excess of that of former years. The wages paid to-day are high, and in the majority of repair shops, railroads are forced to employ mechanics inexperienced in regard to railroad work, and it necessarily follows repairs take longer and the work requires closer supervision.

In the past few years the Government has exercised considerable authority over the railroads in regard to the building and maintenance of power, setting down certain rules and regulations concerning standards, defects, etc., and have assigned inspectors to certain districts to see that rules are observed. While these laws added considerable extra work to most roads it has, no doubt, been the means of improving the power and prolonging the life as well.

As previously stated one of the great trials of all railroads is to keep up the repairs on their motive power. To accomplish this we must provide proper facilities for repairing and handling at roundhouses and general repair shops.

### Roundhouses

It is difficult to do quick work at terminals unless we provide proper facilities, such as suitable roundhouses and equipment. The key to the power handling situation of the roundhouses is the ashpit, therefore we must provide large pits equipped with a sure and quick means of handling the accumulation of cinders. Ample room must be provided on both sides of the pit so that in rush hours fires can be cleaned or dumped and engines moved along out of the way to await their turns on the turntable. If this space is not provided, and after an engine or two has been dumped, it means the work on the engines following is at a standstill until those ahead have been moved. Conditions of this kind causes ashpit gangs to be idle and at a busy terminal a large waiting list is the result.

In close relation to the ashpit is the turntable and shop leads. The former should be of rigid construction and power operated. The leads should be of sufficient length to accommodate outgoing engines and provided with suitable crossovers and water-cranes to facilitate the despatching of power.

A valuable addition to any roundhouse is good machinery. A great mistake sometimes made by railroads is filling up roundhouse machine shops with antiquated tools. When a machine job is required in a back shop it is usually a rush order, therefore speed and accuracy is required. If modern tools are used you get what is desired without delay. All our terminals of importance have been equipped with portable oxy-acetylene welding and cutting outfits, and needless to say they have proved invaluable.

Organization is another valuable asset to the shop. One may have a splendid layout, good tools, etc., but without system efficiency is reduced. We have found by arranging our roundhouse staff in special gangs good results have been obtained. These gangs are grouped as follows: passenger, freight and switch, air-brake, spring and brake-gear, rod and box packing, lighting up, and, last but not least, the boiler gang. The different gangs are controlled by chargemen, who report to the shop foreman.

Engineers upon arrival book the necessary work in a book provided for the purpose. A competent inspector also makes an examination of the engine and records defects found. The work is then copied by a man assigned to this work, who distributes the slips to the respective charge hands. When the work is completed a notation is made in the report book on the oposite page to the one on which the engineer placed his report.

In dealing with roundhouses I might mention an important item that contributes to shop efficiency, but which is sometimes treated lightly, and that is, cleanliness. We have found by experience that in keeping our premises clean and tidy better work is produced and time saved, as spare material can be quickly located. Accidents due to employees falling over old material are reduced to a minimum. In addition to these beneficial results it looks well and gives one the impression that the foreman in charge is "master of the situation."

During the busy season when locomotives are at a premium, the cripples at roundhouses accumulate quickly unless a close check is kept on the shipment of repair parts. We have a system of checking up and forwarding repair parts to out stations that has proved very satisfactory, and has been the means of keeping our locomotives in service during the past severe winter. Foremen at each station send a joint message to the road and shop master mechanics as soon as they find repair parts required. In addition to this, they send in a daily report of engines undergoing repairs which will take over twenty-four hours, stating when engine was taken out of service, what material is required and on whom ordered. This gives the master mechanic an excellent opportunity of keeping in close touch with the situation on his division. To ensure requisitions being filled promptly and to avoid delays in shipment or at transfer points a material man was appointed by the road master mechanic. His duties are to check requisitions, receive telegrams for material, consult shop master mechanics and subordinates as to when material can be secured, see that there is no delay in handling, also advise out stations on what train material is going forward so that he can be prepared to have it removed promptly on arrival.

### General Repair Shops

General repair shops should be of sufficient size to care for the power assigned to the division and centrally located.

When an engine is to be shopped the nature of repairs is mainly controlled by the road master mechanic. Any unusual repairs are decided upon after a boiler inspection and hydrostatic test has been applied. After the engine has been stripped the shop inspector makes out a final report and repairs are made accordingly. Accompanying each engine to the shop is the locomotive foreman's report of repairs which forms the basis from which shop master mechanic works.

There is approximately 10 per cent. of our power under repairs at all times; this is necessary to keep our engines in good condition, and also provides sufficient work in advance for the shop staff, who work entirely on the bonus system. Output and bonus system are so closely related that in speaking of one it is necessary to mention the other. The subject to-night being repairs, the bonus system will only be mentioned when necessary to show why we handle certain operations in certain ways.

over the entire system, but as Stratford shop was the first to try this system we will use it as an illustration.

The repairs required are designated by a certain letter which is in itself a symbol and indicates what kind of repairs are necessary, also approximately how many days engine will be in the shop. If you will refer to the following you will find the letters used with a brief explanation:

B.S.—Boiler to be converted to superheat and will be 24 working days in the shop. (Spare boiler and cylinders are ready before engine comes in.)

B —New firebox to be applied. 21 working days allowed.

C. —Firebox will receive new half side and possibly new flue sheet. 21 working days will be allowed.

D. —Boiler is to be retubed and machinery given a general repair. 18 working days allowed.

D.C.—Same as D except new cylinder or cylinders will be applied. 21 working days will be allowed.

F —Wheels removed, tires turned, boxes and rods repaired. 12 working days allowed.

I —Light repairs, such as replacing broken rods, light patch in firebox, or any work which roundhouse cannot conveniently handle.

S. —Specific repairs. Some special job which is really roundhouse work, but for some legitimate reason is handled in the main shop.

As each kind of repair is allowed a certain number of days in the shop, the list of engines turned out weekly has to bear a certain relationship to this in order that output may be regular, both as to quantity and weight of repairs.

The foremen meet in the master mechanic's office each Friday and incoming engines are assigned to their proper places on the outgoing list. A new list is issued each week.

The engines are booked in in such a manner that each week's output will represent about the same weight of repairs on the whole, although the number of engines may be more or less.

As time is limited I cannot describe the methods as applied in all departments, but would take it for granted the various parts have been repaired and are now in the erecting shop. This department was formerly handled with nine regular gangs, consisting of approximately ten men per gang, controlled by a chargehand who was responsible for three pits. In addition to the nine gangs we had three or four special gangs, such as shoe and wedge, guide bar, and steampipe. Our regular pit gangs carried the engine through from the time the engine was stripped, with the exception of the detailed work above mentioned. Under [illegible] we accomplished good work until our forces became depleted through enlistments, and upon looking carefully into the situation we found where a gang usually had five or six mechanics it would probably have one or two, the remainder being unskilled help. It was, therefore, necessary for us to meet the new conditions in order to keep up the repairs. To do this we re-arranged our men into special gangs, mainly to centralize our machinists on work that really required mechanics, and use the unskilled labor on the coarser work. With this arrangement, instead of a gang having three pits on which to work they have the entire erecting shop, therefore delays were reduced to a minimum. The gangs were arranged as follows:

**Stripping Gang.**—Strip engine complete, with the exception of mountings and pipes. These are taken off by the strippers of the steampipe department.

**Frame Gang.**—Main frame applied and rebolted, front frames applying and rebolting complete (when cylinders are not off) back and front deck castings, waste sheet and cross-tie casting. Furnace bearers back, front or side renewed or bolted, furnace bearer brackets on frame, friction casting and wedge, lining up boiler when engine is rebuilt when the original cylinders are used, steel running boards and brackets with all necessary studs.

**Shoe and Wedge Gang.**—Line up, mark off, machine and fit up all shoes and wedges.

**Guide Bar Gang.**—Set all guides, face all valve seats, apply steam chests and bore cylinders in erecting shop.

**Brake and Spring Gear Gang.** All brake and spring gear complete, fitting up and applying, including brake hangers, brackets, etc.

**Motion Gang.**—Pistons, motion plate and motion plate knees, piston valves, cylinder covers and studs for same, rocker boxes, tumbling shaft and brackets, transmission bars, links, etc., eccentrics, valve rods and other necessary motion work.

**Front End Gang.**—Buffer beams complete, draw casting, coupler and connections, hand railings and columns for same.

**Steam Pipe Gang.**—Stripping the mountings and pipes from engines, repair and grind throttles, steam pipes, headers and units, and apply same complete.

**Trimming Gang.**—Air pump and other air-brake work, inspirators and all small jobs.

**Cylinder Gang.**—Apply all new cylinders.

The foregoing covers practically all operations in the erecting shop. Other work, such as carpentering, tinsmithing and painting is done by the respective departments.

In passing, I would like to touch upon one special feature of our bonus system, which is the key to the success of that system; that is, the demonstrating end of the bonus department. The prices set by demonstration when possible are known to be fair and correct. The chief demonstrator and his assistants have charge of this work over the entire system, and travel continuously from shop to shop. These men do not worry a great deal about prices, as this has been efficiently handled by the bonus department of each shop, which sets the prices according to the peculiar conditions surrounding the different plants, but being our most expert men they concentrate their efforts in bringing each department in all shops to a higher state of efficiency by transferring best methods, and, if necessary, men from one shop to another. As a result of this method workmen are free from the worry of price cutting, therefore the standard of work has shown a steady improvement. This department also controls the method of applying the bonus system, with the result that the method of application is the same at all shops. It is needless to say the results obtained from this system have been highly satisfactory, and in spite of the unfavorable labor conditions we have maintained repairs on our locomotives, and in addition to keeping up the ordinary repairs we have been able to convert 57 engines from saturated to superheated steam.

## GERMAN v. BRITISH GUNS

DURING the years immediately preceding the war the respective merits of British and German naval ordnance formed a topic of frequent discussion in the technical press of both countries. German writers insisted on the better qualities of Krupp guns compared with British, and particularly claimed an overwhelming superiority in lightness, durability and precision of fire. The Krupp 12 in. 50-calibre gun, it was pointed out, weighed only 47 tons, as against the British 12 in. 50-calibre model of 69 tons, which also had a lower velocity. It was alleged further that the British wire-wound guns lacked girder strength, and soon began to droop at the muzzle, which meant falling off in accuracy. These and many other statements derogatory to British ordnance were assiduously circulated by the Krupp advertising agency ,and brought forth rejoinders from gun-makers here. But as no really official facts could be given on either side, the controversy was more or less a barren one. That the German claims, though doubtless exaggerated from commercial motives, had some foundation in fact, was not denied by unbiassed observers of ordnance progress.

The past record of the Krupp works was a sufficient guarantee of the high quality of their products, and there was also the fact that, ton per ton, German naval guns cost considerably more than British. On the other hand, most of those foreign governments which purchased the naval armaments abroad showed a decided preference for British guns, and it speaks well for the reputation of these weapons that practically the whole of the navies of Japan and Italy, and numerous warships of the South American States, are armed with guns either built in England or constructed to English design.

War experience has justified the prediction that German gunnery would be found to be very accurate, particularly at the longer ranges. Salvoes fired from a great distance wrought great destruction at Coronel and Jutland. On the other hand, the almost purely mechanical nature of the German system betrayed it-

self at Jutland by the rapid deterioration of the enemy's shooting when his own ships came under effective fire. That scientific gunnery will become even more important in the future is the conviction of all who have studied the lessons of the war and are informed as to the present trend of ordnance development. Guns of unprecedented size and power are virtually certain to make their appearance, and improved methods of sighting and control may extend the extreme range to 30,000 yards, if not more. Under such conditions victory will, in all probability rest with the side that registers the first hits, for no armour or subdivision is likely to be proof against the devastating effect of the ponderous projectiles of the future.

## CO-ORDINATION OF DEPARTMENT HEADS

EFFICIENCY is a term very frequently used, but is often difficult to define. In no place is this more in evidence than in the average industrial plant, and one of the chief reasons is probably the vagaries of the human mind—a factor that is a relatively unknown quantity in the problem of manufacture and production. Maximum output at lowest cost is generally recognized as a reasonably accurate definition for the word efficiency, but while this phrase may be acceptable to many, the hitch comes when further explanation is desired as to the relative meaning of maximum output and lowest cost. In large establishments, requiring various separate and distinct departments, the efficiency of each department may have attained to the maximum, but the plant efficiency may fall short of possibilities owing to the lack of mutual understanding and co-ordination of the heads of the different departments.

In the general run of engineering industries there are what might be termed five distinct sections in productive manufacture, namely, designing, pattern-making, moulding, machining, and erection. Each is, as it were, a tooth in a gear, the harmonious and free operation of which requires the absolute absence of friction between any two or all of the teeth. Where these departments are operated in complete accord with one another, with the various heads conversant with the requirements pertaining to operating details, the basis of production is pretty well established. However, in many plants contrary currents are often responsible for marked inefficiency. Designs are frequently developed, and drawings made without due consideration of the economic production of the pattern or the casting, and also the possible contingencies arising from the molding of the same, together with the difficulties incidental to the machining of the work. As all subsequent operations are generally carried on from the diagramatical instructions of the drawings, it is very important that these be of such a character as to eliminate, as far as possible, unnecessary difficulties in the construction of the pattern, the molding of the casting, and also the machining and erection of the assembled parts.

### Weakness of Individual Design

As the efficiency of a plant is dependent, largely, upon the work of the drawing office, it is fairly reasonable to assume that the designer and also the draughtsman should be familiar with the working methods of the different departments, and the facilities provided for turning out the work. Where the work is of a standard character it is not often that confusion arises in the sequence of operations between the designing office and the assembly floor. However, in those plants where a large variety of work is turned out, it is imperative that the heads of the different departments work in perfect harmony towards the attainment of the highest standard of plant efficiency. Many designers have a tendency to produce machines and auxiliary parts so that they will have a pleasing appearance when completed. Others will strive to eliminate the artistic and concentrate on the design from an economic standpoint. Both methods undoubtedly have commendable features, but the chief consideration, apart from the serviceability of the machine—which is the all-essential factor of manufacture—is to accomplish the desired purpose at the least possible cost. This in itself is a very important problem, and where various castings are involved in construction, the cost of producing them may entail considerable unnecessary expenditure unless much forethought is exercised by those responsible for the execution of the work.

### Co-ordination of Ideas

The thoughts or ideas of few men run in like channels, so that in the production of castings, particularly of the larger and complicated variety, it is essential that the designer be perfectly familiar with the many detail requirements involved in the construction of the pattern and the casting, the moulding process and the possibilities contingent to the cooling and setting of the metal. Where a pattern is to serve for a number of castings the pattern-maker is generally confronted with a number of questions. How to make the pattern give the longest life? How to eliminate or minimize warp? How to construct the pattern to produce the truest castings? How to produce the pattern as cheaply as possible? All of these questions are of considerable importance, but the point of greatest significance in the making of a pattern of large and irregular dimensions, is the production of a casting that will be perfectly homogeneous and free from shrinkage defects and internal stresses.

Perfection, in the ordinary definition of the term, is virtually impossible in the casting of large and intricate pieces, but the greatest efficiency is achieved when, in addition to a well-made and low cost pattern, the same is made so that a casting will be produced in which the shrinkage imperfections are reduced to the lowest minimum. It is a recognized fact that the moulder is the proper man to consult when pieces out of the common are to be made, but frequently the moulder is not very conversant with blue prints or graphical sketches, so that the pattern must be partly developed before he is able to understand the nature of its construction. In order to avoid unnecessary expense in the making of the pattern and the subsequent casting, it is not advisable but essential that the pattern maker and the moulder should be agreed upon the way the pattern is to be made. Of course, it frequently happens that the requirements are of such a character that little alteration can be made to conform to the best moulding practice, but where changes can be made at the suggestion of the moulder, without materially affecting the design, the same should be given careful consideration as a possible means of producing more accurate and homogeneous castings.

### Necessity of Practical Design

The further benefits from closer department co-operation can be seen in the machining of the work after the castings have been made. The multiplicity of faulty or inefficient design is amply exemplified in the difficulties that are often experienced in devising ways and means for machining the desired portions. And again, we have the trouble of the assembly department, the efficiency or inefficiency of which may be due, very largely, to certain conditions created in the initial design, and overlooked until the piece was actually being assembled. Intentionally or otherwise, many draughtsmen seldom enter the foundry, and the same is sometimes true respecting the pattern-room and machine shop; this is a serious mistake, as the men are permitted to design parts to be made of a material of which they know little or nothing. Even the simplest rib that a draughtsman may incorporate in the design to strengthen a certain portion may be the means of weakening the casting due to the initial strains or crystallisation, accompanied by the variable setting and contraction of the material.

The day has passed, apparently, for the man who is "jack of all trades and master of none," as the tendency at the present time is for specialists in some particular branch of activity. While the latter system undoubtedly has its advantages, it is nevertheless a good thing to have a fairly comprehensive knowledge of those contingent branches that are directly or indirectly connected with your own individual work. Particularly is this true in respect to engineering. In the manufacture of machinery the different departments are so closely related and so dependent on one another, that effective results can only be attained when harmonious co-ordination is the key-note of operations.

SATISFACTORY results, it is reported, are being obtained from the plant erected at Risden, Tasmania, for the electrolytic production of zinc from Australian ore and concentrates. The plant is said to have at present a capacity of 15 tons per day, and obtains the necessary electric power from the state's Great Bear hydro-electric installation.

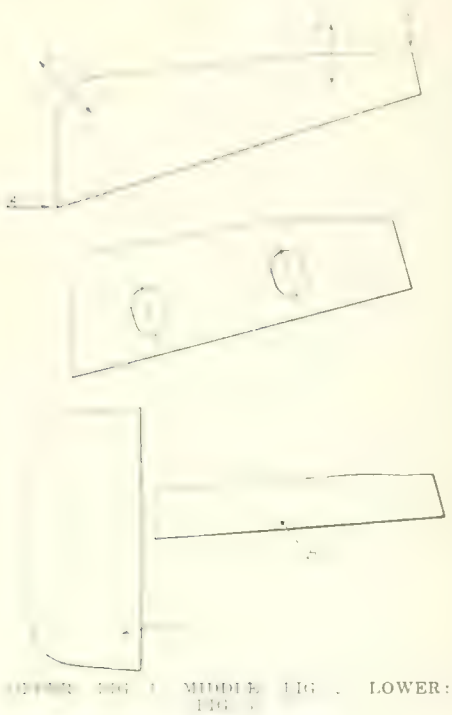
# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## SHELL BORING TOOLS AND DEVICES

By M. H. Potter.

PROBABLY the most difficult operation in the machining of shells is the boring those with closed bottoms. The combination of straight bore, taper bore radius and flat surface make these shells especially difficult to machine. The following article gives details of the equipment necessary for the boring of shells from 3 in. or 75 mm. to 6 in. inclusive.



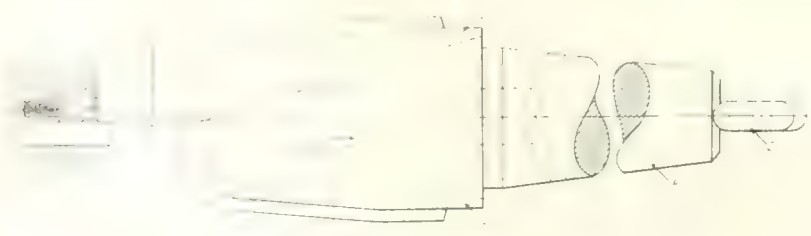
UPPER FIG. 1. MIDDLE FIG. 2. LOWER: FIG. 3.

### The Blades

Various styles of blades have been found satisfactory; each one has its own special features and adaptabilities. While one person will swear by one style, another will favor the other. Figs. 1, 2 and 3 show the different blades in detail. Fig. 1, is probably the best from a general standpoint. It is held in the boring head by means of a tapered block (strip) and fillister head machine screws. The three different styles of blades shown are all shimmed up to size (proper diameter and form) and are ground with the following clearances (see Fig. 1). A to B, 7°, B to C, 11°, from C to D, the straight part, from top of cutting edge to 5/32 in. below, 4° and the remainder 11°. These clearance angles apply to the 6 in. H. E. British shell and were obtained from actual experiment and produce a smoothly bored shell. The blades were ground to a thickness of .500 in. (slide fit in slot).

The blade shown in Fig. 2 is identical with Fig. 1; with the exception that they are held in place by means of two ½ in. fillister head machine screws. The objection that many have to this style of blade is the slotted hole which weakens the blade and tends to cause breakage. Two blades are required of both Fig. 1 and 2.

Fig. 3 shows a somewhat different type. A is the front cutter, one required, and is held in its slot by a ⅝ in. fillister head machine screw. The blades B (Fig. 3) (two required) are held by a clamping block, similar to that shown in Fig. 4. They are placed at right angles to the blade A. Although this style is not as simple as either Fig. 1 or 2 it has given first class results, its advantage being that the blades being smaller are somewhat cheaper to replace.



FINISH BORING HEAD

### The Boring Heads

Fig. 4 shows boring heads which are very neat and dependable types. Their features are simplicity of operation and replacement and wearing qualities. Fig. 4 A shows the ordinary two bladed (single pointed tools) boring head for roughing the straight part of the bore.

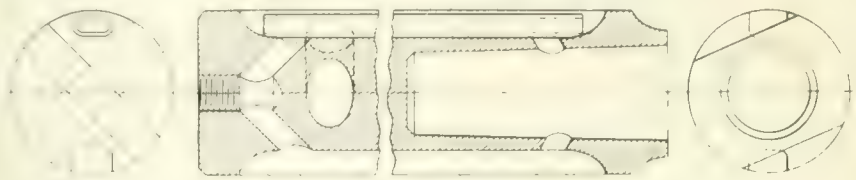


FIG. 5. BORING BAR.

Fig. 4 is used for roughing the contour, re-roughing the straight part and finishing to size. The two heads are identical, the only difference being that old finishing blades notched are used in the head for roughing. The taper of the tang A should be a little greater than that of a standard Morse taper, this will prevent wedging due to the heavy cut at the bottom of the shell. The taper centers the boring head while the tapered slot for a standard taper key not shown in tang holds the tool against the cut. The other tapered slot D is machined in the boring bar for driving off the boring head.

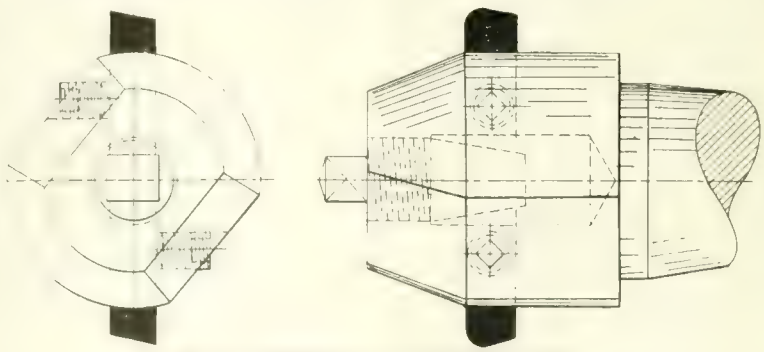

FIG. 4a ROUGHING OUT BORING HEAD.

### The Boring Bar

The boring bar Fig. 5 is the result of careful designing and study. The section drawing, Fig. 5, shows the general arrangement. Attention is called to the method of supplying the cutting compound to the blades. The brass tubes (¾ in. outside diameter) were hammered in place and soldered.

The correct way to make this bar, in order to secure the necessary accuracy required to bore a shell within the limits is as follows: First, center the stock,

second, bore out and reamer the tapered hole for tang of boring head, third, center the bar, at the tapered hole end, by means of a mandrel driven in and turn or grind the outside of bar to the required diameter.

### The Grinding Fixture

The form block grinding fixture, Fig. 6 was used for grinding and regrinding the roughing and finishing blades, Figs. 1 and 2 after they were roughed to shape on a shaper. The plate A was bolted to an old style plain grinder. A dished grinding wheel B, 10 in. diameter, was used. C which has the contour of the blade at D is slid along the straight strip H, the clamps E hold the blade G in position. J shows the blade clamped in position against the grinding wheel. The two adjusting screws K maintain a constant distance between the blade and the form block, see L, and insure a true contour. A gauge was made to permit quick adjustment.

One of the most important parts of this fixture which must be accurately machined is the surface upon which the blade is clamped. Special attention should be paid to same so that when ground the blade will have the same clearances as explained under the description of the blades. This fixture will be of special interest to those who have been grinding blades by hand, as correct clearance angles on the cutting edge are the only solution to properly bored shells. The use of this fixture eliminates to a very great extent the rectification of bores.

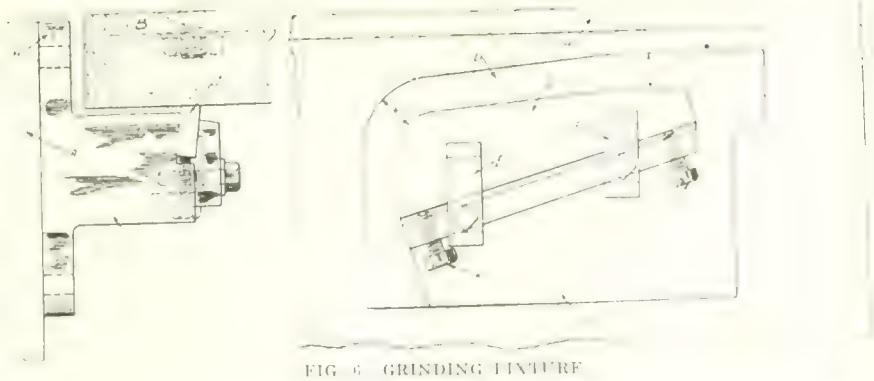

FIG. 6. GRINDING FIXTURE

screw M locks the gauge when in position. It should be noted that the horizontal movement of H must be great enough to permit of taking the boring head on and off. When the blades are placed in the slots they are shimmed out to the proper diameter, a snap gauge being used to determine same (diameter of straight part of blades). This fixture is easily operated and insures the correct contour to the blades, not only that, but if a little care and judgment is used in its use it will place the blades so that each will do the same amount of work, preventing a chattered bore.

JAPAN intends to devote a large amount of money to the construction of good roads during the next few years.

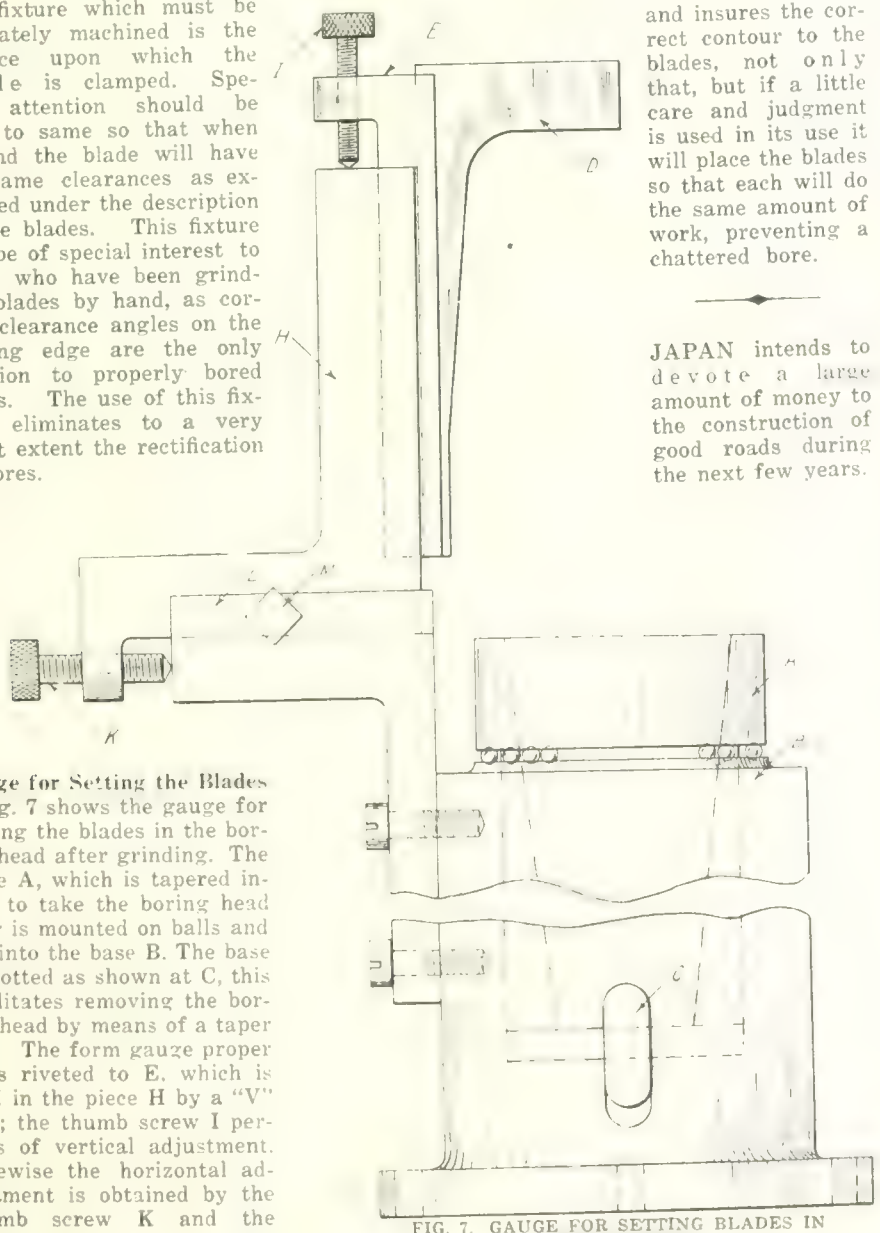

FIG. 7. GAUGE FOR SETTING BLADES IN BORING HEAD

### Gauge for Setting the Blades

Fig. 7 shows the gauge for setting the blades in the boring head after grinding. The piece A, which is tapered inside to take the boring head tang is mounted on balls and fits into the base B. The base is slotted as shown at C, this facilitates removing the boring head by means of a taper key. The form gauge proper D is riveted to E, which is held in the piece H by a "V" slot; the thumb screw I permits of vertical adjustment. Likewise the horizontal adjustment is obtained by the thumb screw K and the "V" slot L. The set

## NOTES ON MACHINE SHOP PRACTICE

By J. Davies

IN selecting the stock for making templates care should be taken to have the stock as flat as possible, particularly if the template be large and made from thin stock; any kinks or buckles are hard to get out. Template stock may often be straightened out by taking a few cuts off the outside, a narrow strip being taken off each time by holding the chisel at an angle so that it helps to stretch the metal.

After the metal has been straightened out and roughly cut to size it is ready for marking off. Some kind of coating should now be put on upon which to mark off the template. If the template is a small one, coat it all over, if a large one, coat where the marking off lines will fall. Probably the best coating is a solution of bluestone or copper sulphate applied with a brush or clean rag; as the coating dries, the surface is covered with a thin layer of copper, upon which lines may be scribed.

The method of marking off depends entirely on the shape of the finished template but generally speaking center lines or some well defined point of measurement should be taken first. Then for all subsequent lines measure from the same place, avoid the common error of measuring from the first line to the second, and from the second to the third and so on, as the amount of error is accumulating all the time, and if a mistake is made in one line the mistake will be repeated in other lines. By measuring every line from the center lines this source of error is avoided.

If the template has any holes or slots in it these should not be cut out with a chisel if a flat template is desired but a series of small holes should be drilled just inside the lines, the metal removed and the opening then filed to size.

Suppose we have a template to make to dimensions given in Fig. 1. This is a depth gauge and is typical of many others in which the same principle can be used to advantage. A high and low side are provided and it is seen at once that the depths .830 and .750 are the important sizes. Probably the most accurate way to make this gauge is to first make the stock parallel, testing by the micrometers and then deduct .750

which will give the remaining depth to [illegible] gauge. A similar operation will enable the high side to be laid out.

### Marking Off Circles

Suppose we have a circle to mark off our circle into three divisions and then

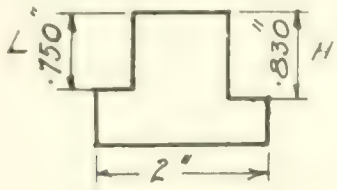

FIG. 1. TEMPLATE

the distance of each division and proceed to step round the circle with the dividers, by the time we get round we have multiplied our error by 24, and this process would have to be repeated very many times before we would get the right space.

On the other hand if we marked off our circle into three divisions and then subdivided each division, we divide the initial error and get our circle spaced off much quicker and more accurately. Fig. 2 shows how to divide a circle. Set your dividers to A any size and mark off lines at B-B, then from B-B divide the remainder of the circle and mark line C; this divides the circle into two parts. Find center between A and C and mark off B; this divides the circle into 4 parts; find centres betweeen C and D and you have 8 parts, and so on. By using the well known rule that one half the diameter will divide a circle into six equal divisions, then subdividing, a number of divisions can be readily obtained.

### Making an Eclipse

A simple and quick way to make an eclipse is by the string method. Tie a string so as to make it endless, use two pins or tacks for centers, and place the loop over both centers and use the pencil or scriber inside the loop. In Fig.

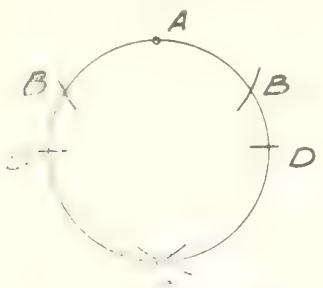

FIG. 2. DIVIDING A CIRCLE

3 the angle inside the eclipse represents the loop, A and B are the two centers and C the pencil.

### Filing Hexagons

File the first flat until the width is equal to half the diameter, then set your bevel or protractor to 120 degrees and file to this angle making the second flat the same width as the first and so on until six sides are completed and you [illegible]

In filing or shaping a square make the two opposite side parallel and the right size, then square up the other two sides to size.

Old files serve some very useful purposes, owing to their very often being of the shape required for some particular purpose. They can be used as drifts or center punches and an old square file is often handy for extracting broken studs by drilling a hole in the stud and driving in the file, then turning out the stud. When using files for any of these purposes, never strike the hardened end with an hammer; have it annealed before using.

In setting up an irregular job in the shaper vise it is sometimes more convenient to pack up the vise than it is to pack up the job, because the job is liable to move every time you tighten up the vise.

If you want to tighten up a foundation bolt for any machine or engine where the bolt is in an awkward place heat the body of the bolt before placing in position and the contraction as it cools off will tighten up the bolt.

In fitting keys make the sides an easy sliding fit, the back flat and parallel and do all the fitting on the taper side.

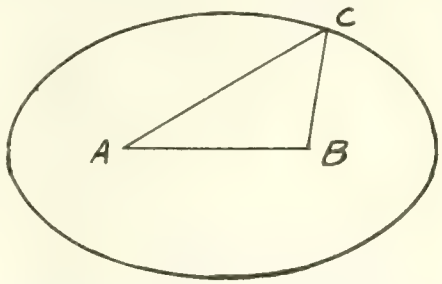

FIG. 3. LAYING OUT AN ELLIPSE.

If you want to ornament a finished piece of flat work, put a piece of hard wood in the speed drill about ½ dia., sprinkle flour of emery and oil over the surface and bring down the polishing or marking stick on work, move it all over the work, and it will produce a pleasant mottled effect. If you want a piece of small round stock for dowels pins or rivets that must be a driving fit, a very useful emergency job can be done by drilling a hole through a piece of tool steel, hardening, then driving pieces of the nearest stock through; often the shanks of wire nails will make good rivets.

When drilling raw hide with a twist drill, to prevent the clogging of the flutes of the drill, hold a cake of ordinary soap against the drill every little while.

## ROPE STRAIN

ROPE STRAIN is a factor that often occasions considerable controversy regarding the actual tension upon the rope when loaded. This subject has frequently been the basis of lengthy discussions but the difference of opinion invariably arises from the lack of sufficient knowledge respecting the fundamental principles of forces in action. To fully understand the question of rope strain it is necessary to familiarize one's self with the third law of motion, namely, "action and reaction are equal and opposite;" that is, when a force is applied, a corresponding force is exerted in the opposite direction. One of the apparently debatable points, in connection with the strain upon a rope, is the different ways in which this reaction takes place. If a rope is secure at one end to a hook in the wall and a man pulls on the other end with a force of 100 lbs., it is obvious that the rope is under a tension of 100 lbs. However, if the rope is removed from the hook and a man is placed to oppose the pull of the other, some persons are under the impression that the rope is under a strain of 200 lbs., due to the pull of 100 lbs. at each end of the rope. This, however, is not the case, as it is quite clear that the extra man has only replaced the functions previously performed by the fixed hook.

Therefore, irrespective of how the reaction operates, it will be readily seen that the strain in the rope can only equal the force or power applied; this not only applies to single ropes under direct pull but also to all individual or multiple systems. In the case of multiple block tackle, where the force applied is 100 lbs., this strain will be equal throughout the entire rope, with some slight variations due to the additional strains resulting from the friction of the moving parts. For instance, in a block and tackle where the free end of the rope is subjected to a pull of 150 lbs. and the weight is suspended from the lower block, which in turn is supported by five sections of the rope, the strain would be uniform in all portions of the rope. With a uniform pull of 150 lbs. the weight suspended would be $150 \times 5 = 750$ lbs., but the strain in each section of the rope would still be 150 lbs., the same as in the free end. The hangers of the upper block, however, would be subjected to a strain of 900 lbs., which is equal to the weight supported plus the force applied to balance the weight.

## U.S. CONTROLS OIL INDUSTRY

GOVERNMENT control of industry was extended to oil in a proclamation by President Wilson on a recent date putting under license the manufacture and distribution of all fuel oils. No mention is made of other oils or oil products, including gasoline and kerosene, but they, too, probably will be put under control soon.

Authority under the proclamation is to be vested in Mark L. Requa of California, recently named as Chief of the Fuel Administration's Oil Division. Licenses must be obtained before February 11 by all manufacturers and distributors whose gross sales of fuel, including gas oil, amount to more than 100,000 barrels a year.

A series of regulations drawn by the Fuel Administration estables in the East a list of preferential consumers who must be supplied in the order they are given, regardless of contracts outstanding.

## VARIABLE SPEED PULLEY

By L. E.

AMONG the advantages claimed for a variable speed pulley without gearing which has been placed on the American market are a reduction in the number of parts employed to provide the speed variation and the adaptability of the pulley for governing the speed of a heavy stamping press or delicate mechanism. It is also possible to vary the velocity ratios between the driving and the driven shafts at will without interrupting the transmission of power.

The pulley, which employs a flat belt, consists essentially of a pair of flanges, a set of segments, and six notched vanes. The segments are of two types, those known as the spring segments forming the first or smaller diameter, while the master segments are arranged underneath. The latter work between the fixed flanges, the vanes sliding through them. Guide slots, in which a roller engaging in the body of the segments travels to produce the expansion or contraction, are provided in the vanes. In this way the pulley retrains a true circumference at any diameter.

When definite variations in the speed are desired, notches are cut in the sides of the slot to facilitate setting. It is also possible to give the slots a perfectly straight outline, thus providing for minute variations in the speed if desired. The pulley is usually worked by a lever and notched quadrant, but where desired a hand wheel or a lever may be substituted. It may also be employed as a clutch in connection with machines driven by an electric motor. In this case the motor is started with the pulley collapsed, so that the bolt slips with little or no load. As soon as the motor has attained its normal speed the pulley can be gradually expanded, thus gripping the belt and taking up the loadby degrees. The addition of an idler puller pressing against the belt enables it to be used as an adjustable-speed pulley, since the slack in the belt is then taken up. The pulley which is an Australian invention, has also been applied to a motor car in substitution for the usual gear box.

## MACHINE TOOL RECORDS

IN a small machine shop no difficulty is found in charging the memory with the capabilities possessed by each individual tool, its power, its range of capacities, its speeds, feeds, and output. But in a large works this is not possible. Yet it is essential that these data should be known in the tool room if work is to be arranged in its correct and complete sequence of operations.

For this purpose a record must be kept in the tool room of the capabilities of every machine in the shop on which the dimensions centres, sizes of work tables, clearances, travels and traverses, speeds, and feeds are all stated. These records may take the form of small blue prints kept for reference in albums or on boards, duplicates of which may be attached to the corresponding machines in the shop.

It is essential to the success of a scheme like this that the times of production on which estimates are based in the tool room should be rigidly adhered to, and not be varied materially except of necessity, and then only by arrangement. Hence a loyal co-operation between the two is essential. Tool room experts are not infallible, machines have their idiosyncrasies, hence the schemes of production may have to modified after friendly consultation with the [illegible] of departments.

If a machine does not produce the quantity on the basis for which its output has been estimated, the total output will lag. The knowledge of the relative utilities possessed by different tools which produce identical results by means of dissimilar methods is a detail which is of much importance in the arrangement of operations by very considerable amounts, provided that the volume of repetitive work is sufficient to keep machines in constant service. This is the reason why it has sometimes been deemed consistent with the truest economy to throw out machines that are in excellent working order and replace them with later designs, the output from which justifies the capital outlay involved.

The movement which has brought the importance of the tool room into prominence, apart from tool making, grinding and repairs, is the ever increasing employment of jigs and fixtures. These inevitably crystallise the methods of the shop in which they are used into uniform patterns. The tool room embraces the tool stores. Within it the small tools are arranged in bins, drawers, and racks, suitably labelled and recorded on cards to be checked in and out. In a large shop this entails a good deal of clerical labor, but enables the location of any tool to be ascertained within a minute or two.

## A TRAVELLING ANTI-WASTE EXHIBIT

IN a large manufacturing plant, where thousands are employed, it is surprising to learn of the food products and material wasted each day.

To give the employees of the Westinghouse Electric & Mfg. Company some idea of the waste the management devised the novel scheme of fitting up a [illegible] of [illegible]

EFFECTIVE EXHIBITION OF MATERIALS WASTED IN A [illegible] PLANT

[illegible] cakes, crackers, pickles, cheese, fruits, etc., as well as a quantity of manufacturing [illegible] lead, mica, rubber, felt, gum, and similar material, which could be used to advantage.

It was estimated that the foodstuffs wasted per day amounts to between $35 and $50, cost of which, of course, comes out of the employees' pockets; the waste of material, amounting to hundreds of dollars per day, is a loss to the company, all of which is due largely to the thoughtlessness [illegible]

Above the material is constructed a sign reading in large letters, "Wasted," and underneath the words, "Food brought from your homes," and on the other side, "Material belonging to the company."

This truck was driven up and down the shop aisles, where the employees could look upon it and form in their minds some idea of the waste in a large manufacturing plant: such an object lesson is valuable at this time when everyone should take all precautions necessary to waste as little as possible.

FORTY-NINE per cent., or almost half of the total railroad fatalities for the year 1916, were due to trespassing on the trains or tracks, a thing that is forbidden by Law in Europe

# Notes on the Organization of a Shipyard Service Department*

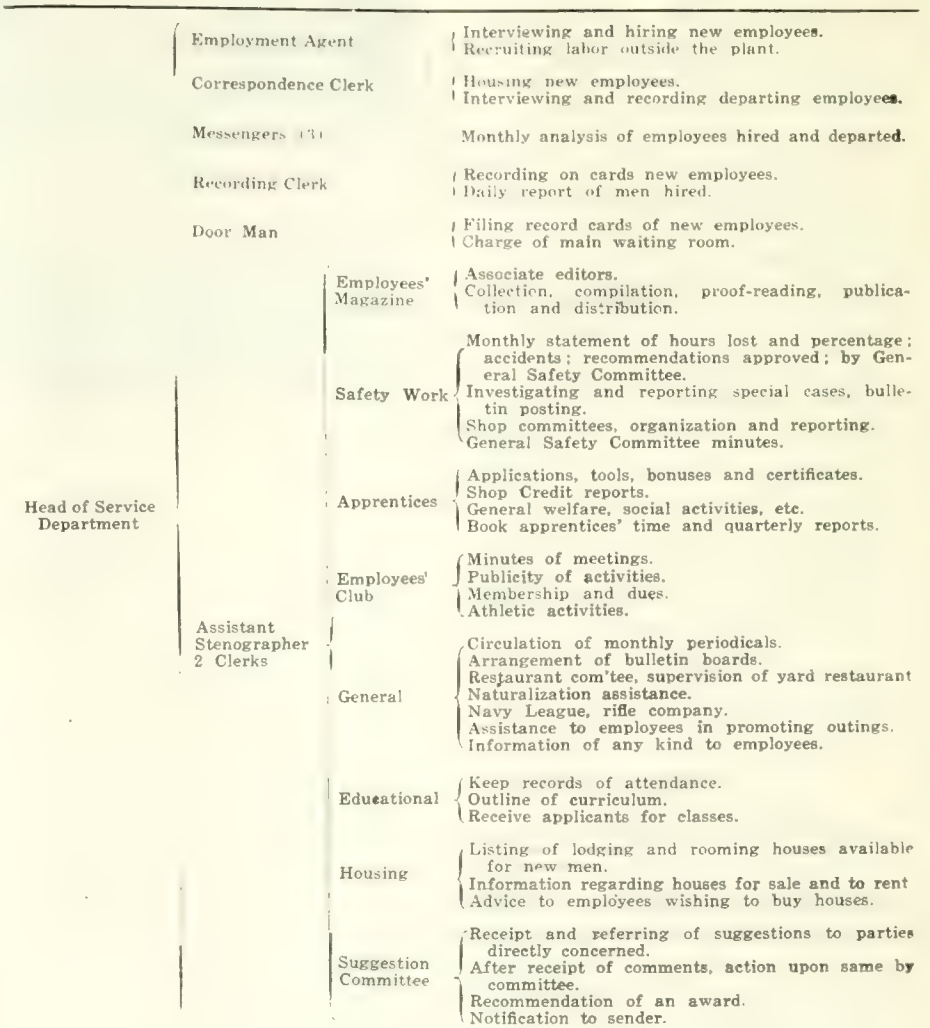
By Samuel W Wakeman

*Humanity's [illegible] help beyond all preconceived ideas are the source of not a little anxiety to [illegible] have assumed responsibility for making good the ship supply of the Allies. The [illegible] results attending the activities outlined by the author are not due to any new or [illegible] ideas but represent the application to shipyard work of what has been done by successful [illegible] in many other and varied lines of manufacturing activity.*

THE object of this paper is to describe a method of handling certain phases of shipyard work which has been successfully tried out in one large eastern plant. Although some of the functions of this department are probably being carried out in the different yards to-day, we do not know of anyone who has treated this problem in just this manner. About two years ago the president of the plant became interested in the enormous number of men that it was necessary to hire each month in order to maintain the working force then needed to carry out the work in hand. He determined that this problem must be solved, and a committee was selected from the plant, composed of workmen, foremen and others. They made a tour of the country, visiting the following manufacturing concerns: Link Belt Company, Sherwin Williams Company, Jeffery Manufacturing Company, Cleveland Hardware Company, Curtis Publishing Company, Chalmers Motor Company, Cleveland Foundry Company, Goodyear Tyre and Rubber Company, Cadillac Motor Company, National Cash Register Company, Dodge Motor Company, Packard Motor Company, Ford Motor Company, Westinghouse Manufacturing Company, Carnegie Steel Company. The most courteous treatment was accorded this committee at each of the above-mentioned plants, and the fullest information was given by them on all of the points which this committee investigated.

### Centralized Activities

On their return they prepared a report of their investigations, together with such recommendations as to the betterment of the then existing conditions as they thought should be made, these recommendations including such ideas as the centralizing of employment instead of allowing each one of the different department heads to carry this on themselves. It also recommended that a new building be erected for this purpose; that a different point of view be taken with regard to applicants for positions, namely, their treatment should be as courteous and as fair as was possible to be given; that the housing and boarding situation be investigated; that all men leaving the employ of the company should be [illegible] a chance to air [illegible] further recommended a great many lines of activities to be encouraged in the plans and touched on many lines that had to do with the physical, mental and social condition of the employees. The recommendations of this committee were printed in pamphlet form and sent to about 200 people in the plant. They were asked to freely criticise and, if possible, to make further recommendations. All of this information was then collected and formed the basis for the policy which is being pursued at the present time in regard to the service work in this plant.



Head of Service Department
Employment Agent
Interviewing and hiring new employees.
Recruiting labor outside the plant.
Correspondence Clerk
Housing new employees.
Interviewing and recording departing employees.
Messengers (3)
Monthly analysis of employees hired and departed.
Recording Clerk
Recording on cards new employees.
Daily report of men hired.
Door Man
Filing record cards of new employees.
Charge of main waiting room.
Assistant Stenographer 2 Clerks
Employees' Magazine
Associate editors.
Collection, compilation, proof-reading, publication and distribution.
Safety Work
Monthly statement of hours lost and percentage; accidents; recommendations approved; by General Safety Committee.
Investigating and reporting special cases, bulletin posting.
Shop committees, organization and reporting.
General Safety Committee minutes.
Apprentices
Applications, tools, bonuses and certificates.
Shop Credit reports.
General welfare, social activities, etc.
Book apprentices' time and quarterly reports.
Employees' Club
Minutes of meetings.
Publicity of activities.
Membership and dues.
Athletic activities.
General
Circulation of monthly periodicals.
Arrangement of bulletin boards.
Restaurant com'tee, supervision of yard restaurant
Naturalization assistance.
Navy League, rifle company.
Assistance to employees in promoting outings.
Information of any kind to employees.
Educational
Keep records of attendance.
Outline of curriculum.
Receive applicants for classes.
Housing
Listing of lodging and rooming houses available for new men.
Information regarding houses for sale and to rent
Advice to employees wishing to buy houses.
Suggestion Committee
Receipt and referring of suggestions to parties directly concerned.
After receipt of comments, action upon same by committee.
Recommendation of an award.
Notification to sender.

A brick building was erected near the main gates of the plant to take care of the hospital work, the employment department, and the general activities of that nature. These activities were grouped under the name of Service Department which, as its name signifies, is to render service to the employees of the plant. This department was put under the supervision of the general superintendent of the plant. The scope of its activities are as follows:—Employment, hospital, safety work, educational work apprentices, employees' club, works paper, suggestion committee work, yard restaurant, shop training. The personnel of this department consists of the following: Supervisor, assistant, clerks, stenographer, supervisor of instructors, employment agent, employment clerk, doorman, doctors, nurses, messenger boys for conducting applicants to shops.

### Interdepartmental Service

In order to see clearly the relationship between the Service Department and the superintendents and foremen in the yard in regard to the supply of labor, the following illustration is used: The ship carpenter may want 10 pieces of 12-in.

*[illegible] Society of Naval Architects [illegible] November.

by 12 in. yellow pine, 30 ft. long. His requisition comes to the purchasing agent, who buys this material and has the same delivered to the ship carpenter. If on inspection by him three or four pieces out of the 10 prove defective, he condemns this material and the purchasing agent replaces it. The ship carpenter decides what class of work this lumber can be used for and decides also whether the price paid for it is justified.

The same procedure holds for the supply of labor. A foreman finds he will need a certain number of men at a given time. He sends his requisition for this labor to the employment division of the service department. They send the required number of men to the foreman after interviewing these men, and weeding out, so far as is possible, such applicants as would be incapable of carrying out the work for which they are required. These men are sent to the foreman of the department, who takes or rejects whatever number he may see fit and rates those he keeps, and those he rejects are sent back to the employment department, where an effort is made to place them in some other department in the yard where they may find work which they can do.

If the men hired are not satisfactory to the foreman, he may discharge them. In no particular are any of the foreman's prerogatives in regard to the handling of labor taken from him. The advantage of this method, however, is that the foreman is not compelled to interview a large number of men who have no qualifications for the work he is supervising, and his time is conserved for the more important duties he has to perform.

### Physical Inspection.

Each applicant for a position is put through a careful physical examination by the company's doctor, and only such men are employed as are capable of doing the work for which they are hired. This has resulted in getting a very good class of men, and, where slight physical defects are found which can easily be remedied, the man is sent to the proper medical authority and taken care of. At first there was considerable objection on the part of some of the men, but at the present time practically no one objects to the physical examination.

The employment department keeps an up-to-date requisition of all labor requirements of the plant, and takes such steps as are necessary, through its various sources of supply, to keep this requisition filled. It attempts to learn, by keeping in close touch with the various departments, the probable future needs for labor, which is a virtually essential factor in keeping a steady flow of men into the yard. All applicants for work are quartered in a waiting-room in the service building, equipped with chairs, and are interviewed in turn by the employment agent, being given a private interview in a separate room. Each applicant when hired is given a book which contains all the information about the plant that it is considered a new man should have. This book has been carefully prepared and gives the hours of labor, the method of tool delivery, certain safety suggestions, times and methods of payment of wages and, in general, information in a condensed form which the new employee generally gets only after long association in the plant. This book has proven to be a great help to new men coming into the plant.

All employees transferred or leaving the employ of the company are required to be interviewed by the employment agent before they can obtain their wages. This provides an opportunity to place the man in a department where he many fit to better advantage than the one in which he was working, and also gives him opportunity to state any grievances he may have in connection with the company, his foreman or his work. These grievances are carefully tabulated and looked into and have been found to be a great source of valuable information in connection with controlling the feeling the employees have toward the company. All records for present and past employees are filed alphabetically in the employment bureau, and these records contain the name, age, trade, physical qualifications, address, place of past employment, rate, &c.There is a daily report prepared by the employment department, showing the number of men hired and leaving by trades, also daily gain or loss in the working force. The department also makes a monthly report of the turnover of labor, including the number of men hired and leaving by trades, showing the length of service and reasons for the man leaving.

### Housing Facilities.

One of the most important phases of the employment work is to provide proper housing facilities, and to this end the employment department lists, for the information of all applicants, boarding houses and available houses for sale or for rent. If there is no position open at the time the applicant applies in person or by letter, an application card is filled out and filed by trades. All applications for employment are filed and, as far as possible, the applicant is informed as to what date his services will be required, giving the minimum and maximum rate for the trade desired and the hours of labor.

Under the service department is a competent surgeon and an up-to-date hospital where all of the accident cases in the yard are treated. The families of the employees may obtain free medical attention during certain hours of the day. The safety work in the plant, which has reached a fair state of development, was combined with the work of the service department and the different shop committees, together with the General Safety Committee, use this building as a meeting place, where frequent talks by men who are specialists along this line of work are given to these men. Each department has its own safety committee, which makes periodical inspections and reports directly to the General Safety Committee. A great many ideas for work of this nature have originated in these committees and numerous appliances and safeguards have been adopted, due to suggestions received from them. All accidents are carefully investigated and the causes are immediately remedied; responsibility for accidents as far as possible is placed and steps taken to rectify them.

All of the educational work in connection with the training of apprentices and the training of men in the shops and different departments throughout the yard have been placed under the jurisdiction of the service department. During the winter months, evening schools are conducted which provide training in naval architecture, mould-loft work, plumbing, coppersmith work, machine shop design, mathematics and blue-print reading. The instructors for these evening classes are, for the most part drawn from the various departments in the yard and the instructions carried out under the direction of the local school board. These classes are open to any male beyond the age of 16 in this locality and are attended by mechanics, apprentices and helpers to the number of about 200.

All of the work in connection with the apprentices in the plant is carried out under the supervision of the foremen in the different departments, but along the lines as laid down by the educational part of the service department, and the head of this department has been very successful in this connection with the attitude of the apprentice toward the company. Each year a dinner, to which prominent officials of the company are invited, is given by the apprentices, and efforts are made to promote the best of feeling among the young men who are being trained for future service in the [illegible]

### Social Services

The service department supervises the publication of a works paper, which is issued every three months by the employees. This paper has developed to such an extent that its issue is awaited with a great deal of interest by all of the men in the plant. The company presented to the employees of the plant a club house equipped with bowling alleys, [illegible] pool table, a band room and an athletic field where the different athletic teams practise and have their games. Quarters are provided for the athletic teams of the company in this building with suitable shower-baths, etc. This club is run entirely by the employees of the company, and only such necessary supervision is given to it by the service department as is absolutely necessary. A restaurant is maintained inside the plant for the benefit of the employees. The supervision of this restaurant, although run by an outside caterer, is left to a committee of the employees who are in close touch with the service department.

One very important part of this service department work is the handling of the suggestions sent in by employees. Boxes are placed throughout the yard, and prizes are offered for suggestions sent in by the men. There is a great deal of work in connection with the

employee means, the making of sketches, the reporting of these suggestions to the proper people so that they may be acted on, and the attitude which the men [illegible] of the work must be careful'y handled in order that the greatest amount of good may come from it. The work of this committee, of which the head of the service department is chairman, is one of the very important functions of this department.

### Tracing Results

All of this work has begun to show results which it is felt can directly be traced to the work of this department. [illegible] of the large manufacturing plants throughout the country that have attempted to increase their [illegible] necessary to hire anywhere from seven to ent employee. The latest results here to ten in order to obtain one. When you and, in the main, to the general broad tion, in order to maintain a force of about 4,000 employees it was found necessary to hire, in the course of a year, 8,000 men. During the last six months the present force has been increased from 4,000 to 8,000, and this has been done by hiring 9,000 men. While these results cannot all be attributed to the work of this department, nevertheless it is felt that, in a large measure, the work which has been accomplished by them is responsible for a large percentage of this

It is not claimed that any new or radical ideas have been adopted in connection with the handling of this situation, but what has been done is to find out what successful concerns in other lines of work have done, and to combine them together in such a way that they might be adapted to the work of a shipyard. A man was employed who was thoroughly familiar with the sources of labor supply in the district in which this plant is located, and much credit is due him for the enthusiasm with which he approached this difficult problem. An outline diagram showing the relationship of the different functions of this department to each other is given in the preceding page.

## THE PINNACLE OF GREATNESS

By James E. Cooley

IN winding valleys and level plains; on rolling hills and projecting peaks of this age-old mother earth, stands man, distant from the summit of great human achievements only by the space that separates it from the base.

Of his own choice he may, if he so wills, remain in a deep abyss or land on top of the world. The choice between mediocrity and greatness is one subject to his own initiative. Mediocrity serves nothing, has nothing, arrives at nothing.

### Evolution of Greatness

Greatness is evolved only by interest [illegible] in one's self and ones work vigorously aroused to some great aim or end, and, further, by an aggressiveness that is coupled to a determination whose force develops only by the fairness of most every abounding energy.

Of his own choice, by his own personal [illegible] he may, if he so wills, [illegible] life that comes sailing to you on wings [illegible] have felt the urge to develop to the limit of your possibilities, to rise from indolence to diligence, if blood is aroused [illegible] will not been lived in vain.

### Self-Possession

All you need is to straighten and tighten your energetic wires. To become charged as earth and sea, as [illegible] and casting waves are [illegible] you need is to rearrange your perspective, discard your mental rubbish, put in thorough order each detail wherever you live and move and strive. Your decision is nothing, your resolution is nothing, you no longer need to juggle or toss the bubbles of time or chance, or believe in a faith that someone else serves you besides yourself. Only your awakened and alert spirit is your self-possession. Give it it's proper chance to work and act. And let its work be power-work, brain-work, muscle-work.

Your energy is the red-blood you, a God-given sweet possession that bids you rise from the strata of content, from the fossilized beds of vanity and self-conceit, and act and be that hustling red-blood you. Have you met the perfect physician, the perfectly skilled surgeon, the perfect lawyer and purist, the perfect artist, and the most learned scientist? You never have, because that being awaits to appear in you.

Do you know a weed from a vegetable, a stalk from a flower, the moon's phases, the planetary courses? Do you still carry a child-mind in a man's body? Are you brutish? Are you still slovenly, [illegible]—are you ready to change? Over the mountain ranges and through the valleys of existence comes now the triumphal sounds heralding in a new day of race-betterment, an era of spirited and energetic men and women. It is calling to you of the disheartened class, you who have failed and linger, you who have been dragged and supported by others, to become strong and powerful where you are now helpless and weak. It is calling you into a vast field to labor in the work of destroying ills, to help prevent wastefulness, to create new methods and conveniences and bring to pass a cradle-to-the-grave healthfulness and happiness.

### Life's Work

No life is worth living, no death worth dying, unless behind these there are unnumbered days of exertions and strivings in world-betterment accomplishments. No seed is worth planting, no harvest worth gathering, if behind these man's labor has not been to lift humankind from what it is to something high- [illegible] to broaden the mind to enrich the intellect, to throw a light in the darkness, to shift feet from aimless roads, to [illegible] sides to feed, clothe, and rest the human body.

Ask not what you can do, but see what you are leaving undone. Ask not where your talents should be directed, [illegible] Awake from your littleness and obscurity, move upward and outward. Find no labor too little or too big, but what you can and should handle with thoroughness and despatch. Don't dream, don't idle, don't waste, or talk and mimic in useless repetition. And when you have finished a task and done it well and to the best of your ability don't sit in mopish wonderment and admire it. But, rather move again forward, give yourself no rest, think not of meals, of clothes or ease, but move steadily on.

### Personal Effort

Go thou forward and accomplish greater "stunts." Revive each lagging moment with greater urge. Aspire and perspire in unceasing toil and labor. Be early at work, tirelessly alert and awake. Strive steadily on from sunrise to sunset, or from sunset to sunrise again. Let your efforts be a battering-ram across the labor of the day; a lever and fulcrum to pry each impeding obstacle. Be accurate, be punctual, be fully alive to all your possibilities.

Go thou forward with undying faith in yourself; a firm believer in yourself; held back by no weak hindrances, but with a steady outlook on a progressive path. Increase your speed, increase your skill, think out new ideas, adopt new methods, be saving, be thrifty, and above all be energetic.

Let us break away from old world forms and habits. Let us recreate from out of the old a new-world-building rich and grand. Let us make it unpopular to lie and cheat and steal. Let us make it unpopular for young men to marry un-

less they have prepared a home or saved sufficient means to get one. Let us care for the aged that there may be no longer fatal lamp burnings or broken hips. Let us see that each child born in the world is properly clothed and nourished, receives a good education, and gets a fair start. Let us protect girlhood and womanhood from moral perverts. Let us have no social outcasts. Let us rid ourselves of age-long evils. Let us live as near as possible in a scientific realm. Become forceful energetic beings, with discerning minds.

### Introspection

Let each one of us this generation go forward and create a new epoc. Be real, live, acting men and women, wakeful and alert, spiriting and urging ourselves daily in a common purpose and strive to attain the pinnacle of greatness in noble works for human-kind.

This we can do and this we will do just as soon as we begin to look deep within and see ourselves as we are, and arise to our possibilities; just as soon as we discard our cloaks of lethargy, tear down the dusty films from brain and vision, quicken our pace, increase our combativeness, and stir up within ourselves the fires of energy.

## SOME NOTES ON THE HISTORY OF ARTIFICIAL FLIGHT

While the history and development of the aeroplane and the dirigible may be said to be confined almost entirely to the present century, there were a few venturesome pioneers in the past ages who speculated with optimism upon the possibility of man's conquering the realms of the air.

### Aviation

Aeronautics is divisible into two main branches—aerostation, dealing properly with machines which are lighter than air, and aviation, dealing with the problem of artificial flight by means of flying machines, which, like birds, are heavier than air, and also with attempts of human beings to fly by the aid of wings fitted to their limbs.

As might be expected the fitting of artificial wings, being the most natural means of locomotion to suggest itself, would first appeal to the imaginations of men, and so Greek mythology and Egyptian bas-reliefs both suggest this means of locomotion.

John Wilkins, one of the founders of the Royal Society, discussed the possibility of flying to the moon and cites several myths or fables, to him true, of men who had succeeded in flying by means of wings. One of these, a monk, living in Edward the Confessor's time, was said to have flown a distance of about a furlong.

Francis Bacon likewise in his Natural History discussed the possibilities of artificial flight, but in a manner obscure and somewhat confused.

### Leonardi Da Vinci

One of the most versatile men of any age, Leonardi Da Vinci, who was painter, sculptor, architect, musician, mechanician, engineer and philosopher, devoted some of his time and inexhaustible genius to the study of artificial flight. He excelled in all of these and in engineering and scientific subjects was in many instances a pioneer.

For one living in the fifteenth century his knowledge of science in general was remarkably complete and accurate, and in one of his sketches he pictures a machine so closely approaching to the modern aeroplane in design that had it been fitted with the proper motive power it might conceivably have flown.

### The Flight of Birds

The impossibility of man's flying by means of wings and unaided by any external motive power was first clearly pointed out by G. A. Borelli in 1680. By means of an examination of the flight muscles of birds and calculations as to their enormous power he clearly pointed out the impossibility of man's being able to suspend himself in the air by means of his muscular strength alone.

Many attempts have been made to devise means of flight patterned after the wings of birds and provided with motive power for effecting the flapping of the wing members, and while the principles underlying bird flight are well understood and while excellent models have been made which have flown considerable distances, no device sufficiently large enough to sustain a man has as yet been constructed, possibly because of the many disadvantages and constructional difficulties inherent in this type of machine.

### Dr. Johnson and Aeronautics

The great English lexicographer, Dr. Johnson, was perhaps the first to state with accuracy the principle involved in any successful effort with "heavier-than-air" machines. How it happened that he, who had but a casual acquaintance with the science of his time, directed his attention to this matter, it is now impossible to say.

In 1759, to raise money for payment of charges consequent upon the death of his mother, he wrote "Rasselas, Prince of Abyssinia," a remarkable book telling of a quest for happiness. The story relates that before starting on his travels with this object, the prince, amongst other devices to relieve ennui, had consorted with men of learning and skilled exponents of various arts; amongst these, a mechanical genius, referred to as the "artist," who, to provide amusement for his patron, suggested an attempt at flight, and in discussing the matter says: "He that can swim needs not despair to fly; to swim is to fly in a grosser fluid, and to fly is to swim in a subtler.' Then follows this enunciation of principles: "We are only to proportion our power of resistance to the different density of matter through which we are to pass. You will be necessarily upborne by the air, if you can renew any impulse upon it faster than the air can recede from the pressure." This is a remarkable statement having regard to the state of knowledge at the time—159 years since. It correctly defines the principle underlying "heavier-than-air" aviation.

Dr. Johnson's was a mind extraordinarily active, and not to be deterred from addressing himself to a strange subject by its strangeness merely, so that no great surprise need be felt that he should consider this, but only that he should have made so illuminating a pronouncement with respect to a branch of study alien to his usual pursuits. By a Newton it would have been stated with more of mathematical precision and effect, but not more truly. It is not improbable that Johnson, mingling with the intellectuals of his time, got the idea, expressed so well, from one of these, but there is no evidence of this, and we need not question but that his naturally vigorous intellect was well able to go straight to the root of such a matter, even though it might be on ground unfamiliar to him. On the other hand, he may not himself have fully realized the truth of the statement, a supposition countenanced by other theories advanced by the "artist" of a much less acceptable nature.

It is of interest to note that the prince is described as having given his consent to the experiment, the mechanic stipulating that his invention should be kept secret for reasons which must appeal to us to-day. He says: "If men were all virtuous, I should with great alacrity teach them all to fly. But what would be the security of the gods if the bad could at pleasure invade them from the sky? Against an army sailing through the clouds, neither walls, nor mountains, nor seas, could afford any security. A flight of norther savages might hover in the wind, and light at once with irresistible violence upon the capital of a fruitful region that was rolling under them."

Later in life, Johnson appears to have been attracted by the attempts of the ballonists. The Montgolfer brothers were experimenting in 1783, and on September 29, 1784, the doctor wrote to a friend that he had received three letters in one day about "the air balloon."

In October of the same year, with reference it is to be supposed to some mishap, the doctor wrote: "The fate of the balloon I do not much lament, to make new balloons is but to repeat the jest again... The first experiment, however, was bold, and deserved applause and reward. But since it has been performed, and its result is known, I had rather now find a medicine that can cure an asthma."

ONE of the serious difficulties in the melting of copper in an open coke fire is the absorption of sulphur which will take place. Copper carelessly treated in this way will smell strongly of sulphur dioxide in cooling, in which event it is useless for casting until the sulphur has been removed. The most careful attention is necessary in melting copper in order to ensure good results in castings, and one means to this end is the use of salt in conjunction with the charcoal that is now universally used, says the *Brass World*. It is not necessary to go to extremes in the use of salt; just a tablespoonful to 100 pounds of metal will be a great help in all ordinary cases, but when the metal has been burnt more will be required.

# Sales Agent Caught a Tartar When He Tried to Fix Toronto Superintendent

## Had It All Figured Out How He Could Make a Good Sized Rake-off Each Month—Trap Was Laid When the Sales Agent Thought He Was Putting Grease on the Skids That Would Lead to Big Business

*The facts contained in this article were given to a representative of* CANADIAN MACHINERY *this week. An official of a large plant in Toronto outlined the whole thing as it happened. For reasons that are very legitimate he requested this paper to not use the name of his company or the company using the "greasing" method referred to here. However, he was anxious that the facts should be brought out so that this method of doing business should be suppressed.*

FIRE the purchasing agent of this city we'll call the salesman Mr. Grease from the method of his tactics of greasing the hands of those with whom he did business. The superintendent of one of the best-known shops in Toronto can here be called Mr. Blank. Mr. Grease represents a house calling on machine shops and kindred plants. He hails from a city other than Toronto. Not having been able to secure orders from the Toronto plant in question, Mr. Grease kept on persistently, and at last got in an initial order. The order was given more to get rid of the man than because it was considered that his wares had any particular merit.

### His "Follow-Up"

Now that he had driven the thin edge of the wedge, Mr. Grease sought to lay hands on the sledge hammer that would open the Toronto house up for his line of goods. He didn't bother about any of the understrappers around the shop. He went straight for the superintendent. If he could tie him up the business was his. He didn't waste much time in the preliminary wind-up. Mr. Grease figured that his snake fund was the most powerful weapon he could bring to bear on the situation. So he got Mr. Blank in his office in the factory and easily at first, and with a great burst of speed as he proceeded, he began to lay the programme.

### Lots in On This

"You don't need to be afraid of this," urged Mr. Grease, "almost every person is doing business on this plan now, and none of them who are dealing with me have ever had any trouble. The goods will not cost your company any more on

Superintendent.

this account. The thing is square enough. I spend money this way instead of advertising. I will pay you one per cent. on every dollar's worth of business you place will me from your company or any of the other concerns [illegible]. I have gone into this matter carefully and I want your business. I am prepared to make it worth while for you. I reckon that I can get for your own pocket, if you can switch your whole plant to my line, at least $1,000 per month.

### He Was Doubtful

Mr. Grease left the vision of the thousand per month in thin air for a moment. He reckoned that it would not take long for a four figure harpoon to ride through the skin of Mr. Blank's scruples. But Mr. Blank was not quite certain. If he was going in for the snake fund he wanted to grab a good big fat snake instead of a skinny little garter snake that the hired man can kill with the hoe handle.

"But one per cent. is not much for me to get out of this," argued Mr. Blank, "considering all the money I make for you and the chances I take in doing this kind of work. What's more, I understand that you pay a higher rate than this to some of the other men you deal with."

### A Bright Idea

"The rate I offer to pay you," replied Mr. Grease, "is exactly the same as I am allowing to the others who are in on this offer. However, if you want to raise it a little, I believe it can be done. Prices are jumping in all lines just now, and it wouldn't be much of a trick to raise the price to your firm a little. That increase is yours," concluded Mr. Grease with an impressive wave of the hand.

"Looks easy enough," remarked Mr. Blank, "but it would be safer if we could get the purchasing agent in on this, too. The two of us can swing such a proposition much easier than one. We practically have the whole thing in our hands here. When you come again on Friday I'll arrange to have the purchasing agent on hand. By then I can have a favorable report on your line, and we can fix it up to get started at once."

So Mr. Grease left, having made an engagement for a visit with Mr. Blank and the purchasing agent on Friday.

### Ready for Him

Mr. Blank at once got into touch with the officials of his company. He had been with them for twenty years, and he

Superintendent Advises Secretary that "Grease" Should Get on Casualty List.

knew they trusted him implicitly in everything. He outlined Mr. Grease's plan of campaign, and suggested that he would be a good man to kill off quick. So plans for the killing were arranged. Mr. Blank and the buyer were to meet Mr. Grease, while another official, whose office was contiguous to that of the superintendent was to be an unseen witness to the handing over of the coin, for this was one bit of evidence that they were particularly anxious to hang around Mr. Grease's neck.

### They Were Ready

The salesman was on deck at the appointed hour on Friday. When a man's going to swing a big deal he can't afford to sleep in in the morning. Mr. Grease believes in this. Mr. Blank and the purchasing agent believed it too. Introductions followed after the office door had been carefully closed. Mr. Blank assured Mr. Grease that the third party to the deal was O.K. This relieved the element of doubt and brought about the very at-

The Sales Agent Brought in. Superintendent Assures Grease That He's O.K.

mosphere in which big deals are hatched and where millions come to existence.

Mr. Grease led. In fact he played his whole nine innings before the others had a chance to come to the plate. The thing looked good to Blank. Likewise it appeared a pleasant thing for the purchasing agent to gaze upon. Mr. Grease took a pencil, a jacknife and a sheaf of paper. He put it down in black and white, showing how there was a good fat

thing in the deal for two on a fifty-fifty basis.

**He Had the Cash**

"But how about the commission on the first order?" asked Mr. Blank, who was anxious to speed up the game to the point where Mr. Grease would produce the actual cash.

But they couldn't stall Grease. He had apparently not forgotten anything. He was prepared to put salve on the skids right from the start. With a bland smile that comes but few times to few people and often not at all to many, he let his strong right hand glide to his inside pocket. He produced an envelope from a spot close to his heart. Said envelope had five new ten dollar bills. Grease handed them over with the remark that a procession like that would come in handy. He also suggested that a real order could be accepted right now.

**What Happened**

Mr. Blank took the snake fund in his hands. It seemed to make an excellent tonic for his vocal chords. It also put some ginger into his make-up that Mr. Grease had not noticed before.

"You poor, miserable cur," snapped Blank. "I have been with this concern for twenty years. I have handled deals that would make you dizzy. The company has been on the level with me and I have been the same to them. This is the first time I have ever been insulted by such a dirty low-down offer. You

The Handing Over of the Coin put Lots of Action in the Superintendent

will never do another cent's worth of business with this or any other concern that I can head you off from." Then, tossing the bills across the table he concluded "you'd better take your dirty little bills and clear out while the way's still open."

Poor Grease gathered up his snake fund, his hat, and cleared out.

**Would Deduct it**

The secretary of the Toronto concern was on the point of writing the firm represented by Mr. Grease to the effect that they were sending them cheque for the goods minus one per cent. which they understood they had been overcharged. A better way was suggested. It was found that the goods were still intact. They were shipped back, a letter following stating that owing to the rotten business methods followed by the concern it was not their wish to have any dealings with them at all.

"Do you come in contact with much of this sort of business?" inquired CANADIAN MACHINERY.

"Very little that comes to the surface," answered the official. "It is hard to find evidence that you can lay your hands on, although cases have come to the top where the scheme has been tried. The men who follow the graft game generally keep a good distance from the factory. They aim to 'fix' some person in our organization whom they can use to advantage. Fortunately we have an airtight staff that can't be fixed," he concluded.

**From the Legal Point**

CANADIAN MACHINERY discussed the matter with a gentleman well qualified to speak from the legal point on this question.

"In such a case," he stated, "the man who gives a bribe and a man who takes it are open for a charge. Of course it would be different where the man took it in this case with the knowledge of his company. Not many of these cases are ever followed up. Companies do not like the publicity they get in court. There is also an element of injustice in it for the companies that are proceeded against, for the actions of one dishonest salesman may be taken as the policy of the entire organization, which might be quite honorable and honest. Were there a desire on the part of the company to follow up such a case it could be done," he concluded. "The Crown attorney would have good cause to go ahead and issue the papers."

## THE CARE OF SAWS

THERE is a very great deal of bad work by those who use a saw, which no influence of any kind can improve, and a good deal of this bad work is due to the state of the saws, which will not cut straight unless the teeth are all of one height, and set equally to the right and left. If a board has to be planed after sawing, much more labor has to be expended on it to give it a good surface when badly sawn. In spite of the progress of wood-working machinery, the hand saws will never entirely disappear in remote districts, or in places where they are required occasionally, and the chief consideration is the amount they will cut in square feet without re-sharpening. Much depends on the nature of the wood and the amount of dirt that lies on the surface, which, when carried into the path of the saw, rapidly spoils the cutting action of the teeth. But more depends on the complete regularity of the tooth points both as regards height and projection to right and left after "setting." When half a dozen teeth in various positions on the saw are found to have a rounded point, due to wear, while all the rest of the teeth are quite sharp, it is plain that this half-dozen are projected so much beyond the others as to prevent them from engaging in the work of cutting. The progress of sawing is thus proportionately reduced. A well-filed saw shows equal wear on all the teeth engaged in work, and if the setting is equal it will cut in a straight line with very little guidance. The width of the cut must be nearly twice the thickness of the blade to permit the sawyer to guide it against the influence of knots or change of direction of the wood fibre. Saws of good quality wear out more files than [illegible] longer, and being spring tempered they remain perfectly straight. There is no profit in a cheap saw for a man who uses it often. The circular saw, after a long period of popularity, is now giving place to the band saw, which is more easily managed. The circular saw requires very careful management, and if twisted or buckled needs an expert to set it right. Its popularity depended a good deal on the ease with which it could be fitted up on a wooden bench. The frame of the band saw costs much more, but the blades are comparatively cheap, and it will deal with much thicker logs than can be cut by the circular saw. It is estimated that there can be from 50 to 65 thousand feet of average wood cut on one sharpening.

## ELECTROLYTIC ZINC

THE complex ore question now has been practically solved. What under old conditions was waste has suddenly become valuable. Even if only 80 per cent. of the zinc in complex ores can be recovered successfully by the electrolytic process in its present state of development, the removal of this large percentage of a deleterious element from a complex ore will simplify the extraction of the remaining more valuable elements. Western metallurgists now estimate that they can treat the so-called complex ores by the new method, crediting to the process the value from the sale of silver, gold, copper and lead, and producing zinc at a price that will compete with the retort process under normal conditions. Even had the war not broken out when it did the electrolytic zinc process would still have been developed. The directors of the Anaconda Copper Mining Company were so impressed with this belief that they authorized a series of experiments at large cost, and they were concluded under the direction of Frederick Laist. They constructed a plant that produced 10 tons of zinc per day, and later increased this to a capacity of 35 tons. They decided then to build a modern plant close to the source of power, as this is the principal item in the cost of the process, erecting the largest zinc refinery by the electrolytic process in the world at Great Falls, Montana, U.S.A. The plant as designed will consist of five units. Late in December, 1916, three units were in operation producing 95 tons of metal per diem, assaying 99.92 per cent. zinc. The completed plant will have a capacity of from 160 to 175 tons daily. During the experiments in the test plant at Anaconda the process originally proposed by Laist and Frick was much simplified, consisting essentially of the following steps: First, careful roasting of the concentrate at temperatures not exceeding 730 deg. Cent.; dissolving the zinc, together with a little iron, by spent electrolyte in Pachuca tanks. A small amount of manganese dioxide is added to oxidize the iron, which is then precipitated by powdered limestone, bringing down any arsenic or antimony that may be in solution. This is leached through Oliver filters, containing only zinc sulphate, with a little cadmium and copper, is treated with zinc dust and again filtered, the filtrate being the pure zinc-sulphate solution which is sent to the tank room. The anodes are of pure lead and the cathodes [illegible] 48 hours only, when the zinc is stripped from the cathode sheets and melted into slabs.

## BUSINESS ON AN HONORABLE BASIS

THE "greasing" method of doing business is not dead. It's been killed as many times as the Turk cruiser "Goeben" has been sunk, and as many executions have been performed on it as are registered up against the iniquitous practice of political patronage.

But it has a powerful come-back. Its recovery is always a little better than its recoil.

When one man or class of men are ready to drop it, there's bound to be another set coming along to pick the old thing up.

However you look at it, it's a poor way to do business. An article that can't travel on its merits is expensive at any price.

The system of paying a man to get a certain line of goods used or introduced into a factory where he occupies a responsible position is a miserable subterfuge for clean methods.

Sooner or later the thing will play out. The straw and wood will burn up and your greased organization will go down in such a heap that its knees will be driven up to its chin. After that the old cripple can never be straightened out again.

Whether you are selling, buying or manufacturing, go it clean. Get your business methods up level with your head where you can look them straight in the face. Make certain that your business is done in such a way that you won't have a brown tongue the day after.

Don't make the mistake of thinking that a little bit of temporary success can be worth as much as a permanent organization, built on legitimate and honorable lines.

And don't forget that there are very, very few firms who want to do business on the "grease" plan. They want to spend a dollar and get a dollar's worth of real value in return. That, and nothing else, is the real basis for successful and lasting business relationships.

## TELLING THE PLAIN FACTS

SIR ERIC CAMPBELL GEDDES, First Lord of the Admiralty, has been telling the people of Britain some plain facts in regard to the sinking of tonnage by the German submarines.

He has not stopped to mince matters. He has not attempted to cover rough spots by a smoke barrage of oratory. He has stated the facts, and in so doing has blazed the way for more plain talk from men in a position to command attention.

Sir Eric declared that it was possible to make good the losses to Allied shipping, but modified this with an IF that lends an element of doubt to his statement: "If we are given an adequate supply of men and material."

During the last quarter of 1917 Britain had lost on an average of 260,000 tons monthly. In that same period the construction had amounted to 140,000 tons monthly. In other words, the German submarine campaign in that period was winning against the best efforts of the British shipyards at the rate of 120,000 tons per month.

That is not a pleasant thing to look at. It justifies the use of the word "serious," which is noticed several times in Sir Eric's address.

Men skilled in the shipbuilding craft have been taken from the army in large numbers, and the military authorities contend that in many cases this has brought about an almost complete disorganization of certain units in which these mechanics held important positions.

When men in leading positions call a serious situation by its name, and cease to temper their words to suit the wishes and expectations of the people, the public will soon come to want the truth, and, once having secured it, brace themselves to it.

No nation or body of men can do its best work unless the plain, unvarnished facts are put before them.

It's no use expecting a man to lift a ton after leading him to believe that he was in for only a 500-pound weight.

## ILLITERACY IS WIDESPREAD

SECRETARY of the Interior, Lane of the United States, has done his best to open the eyes of the American people to the extent to which illiteracy has gripped a large section of the people of the Republic. It may be that United States participation in the war has brought the matter home to the authorities in a way that nothing else could have done. However that may be, Secretary Lane has put the matter squarely up to the people of United States and if they don't act to meet the situation it will not be because they have not had sufficient warning.

Here are some of the facts that Secretary Lane shows up:

There were in United States in 1910 no fewer than 5,516,163 persons under 10 years who could not read or write.

There are 700,000 men of draft age in United States who can neither read nor write any language.

Over 4,600,000 illiterates were over 20 years of age.

Half of the illiterates were between 20 and 45 years of age.

Over 58 per cent. are white persons, and of these 1,500,000 are native born whites.

It is estimated that the labor value of an illiterate man is 50 cents a day less than that of an educated one. This means an annual loss of $825,000,000.

Ten per cent. of the country folk of United States cannot read a bulletin on agriculture, a farm paper, food pledge card, a Liberty Loan appeal, or anything else.

These men, 40,000 of whom are drafted in the army, cannot sign their names; they cannot read orders, the manual of arms; they cannot understand the signals or follow the signal corps in time of battle.

This condition is not a very pleasant commentary on the state of affairs in United States, and the same remark, in less degree, doubtless applies to Canada. In times of peace the country has allowed these great bodies of people to slip and drift through the fingers of its educational system. Now, in times of war, it will find that the men drafted into the army will have to acquire some knowledge of the English language, and probably of reading and writing it.

# CAN NEVER AFFORD TO LET UP WITH STUDIES

**T. L. Crossen's Experience May Help Some Mechanics To See How Success Can Be Achieved.**

HE reads technical papers—likes to read the advertising pages—has done so for years. He believes in putting study and practical work together—in fact reckons they're a good tandem. Used to be an apprentice in a tin plate mill. Was 17 then. Now he's superintendent at the age of 38.

T. L. Crossen came to Canada to look after the erection of the plate mill of the Dominion Foundries & Steel, Ltd. The first steel for the mill construction was laid down on the first day of July, and Mr. Crossen had rolled steel ready to ship on October 25, 1917. Since then it has been a matter of getting the organization into better shape, adding to the plant, training men for the work and trying to keep up with the expansion that is the trail of this Hamilton concern.

T. L. CROSSEN

### Where He Started

It was in Cambridge when the old Morton Tin Plate Co. was still doing business that Mr. Crossen started as an apprentice in the machine shop. He was 17 then. Not long after the American Sheet & Tin Plate Co. took over the Morton concern, and Crossen, the apprentice, was included in the word "concern." Finishing his trade he soon became machine shop foreman. The Jessop Steel Co., at Washington, Pa., got him as assistant master mechanic. He had been twelve years in the work then. "One thing happened there that I'll never forget," said Mr. Crossen: "It was when we were making some very special and exacting tests on a new process. Sydney Robinson, managing director of the Jessop concern, was waiting to see the outcome of the experiments. He was as keen as a school boy and full of anxiety. Well, the results were simply great—away beyond anything we had hoped for. Mr. Robinson, a few minutes after we had finished the test, came out and shoved a cheque for $100 into my hand. He was pleased. So was I. I don't know what pleased me most, the cheque or the success."

### A Word to Mechanics

Shortly after that Mr. Crossen went as master mechanic to the Universal Rolling Mill Co., at Bridgeville, Pa., and his next step landed him as superintendent of the plant where he is at present engaged in Hamilton.

"If there's one thing the young mechanic should get into his system," stated Mr. Crossen to CANADIAN MACHINERY, "it is the value of reading and studying. I used to do some correspondence school work myself, but combined it with shop practice. The two go well together. The advertising pages of the technical and trade papers interest me. There you will find the latest thing in machinery. Especially the illustrated ads—they are written by men trained to bring out the very best features. If a man is asked for advice about the purchasing of equipment, he is in a position to give it if he is in close touch with the advertising pages of technical papers."

### Helped This Chap

Mr. Crossen has seen a number of young men enter the mills and work up. One chap came in at Pittsburgh. His father was English and his mother a Russian. Both were dead. The young man came as a laborer, and worked hard. "He came to me three months after," said Mr. Crossen, "and told me he wanted to be a machinist. I got him a chance and he was quick to learn, but he didn't know enough. I put it up to that chap to go to night school or quit his job. He went to school. Later he was in the Carnegie Technical School. He's now assistant general engineer of the Superior Rolling Mill. He's only 28 years old, and he'll go higher. A man can't afford to quit studying or learning if he's going to keep up with the developments that are coming up almost every day now," concluded Mr. Crossen.

In recalling the use to which the products on which he has worked were put, Mr. Crossen tells of rolling 4,000 [illegible] for work on the Panama Canal. Another interesting touch is that the first steel he rolled in Canada was consigned to a firm in Tientsin, China.

[illegible]

PIGS have once more gone and shoved the lid off the price can, and are now quoted at between $20 and $21 in Toronto with their boots on. It's only a matter of time until we'll have to teach 'em to play the piano and eat with a knife and fork.

* * *

THE Dominion Railway Commission has heard and granted an application to allow oleomargarine to be carried in the same type of cars as butter, poultry, eggs, etc. But it's a wonder we don't hear of a wee bit of brick heaving when a can of oleo slows up in its voyage through a strictly dairy section.

* * *

"ON our boat they had 185 third-cabin berths empty, absolutely empty, while the wounded men and furlough men of the first contingent were confined below. They might at least have given vacant berths to the cripples in the party." Is that the best Canada can do for its first contingent men? If so, it's time there was a mighty hard rattling and shaking of dry bones in high places.

* * *

IN Guelph the City Council has gone and put a new tax on dogs, from $3 to $5 each, and $15 for a kennel. Still it won't make much difference when a dog plants a soup bone in the centre of the geranium bed. A $3 pup can make just as big a hole in the ground as the $5 brand.

* * *

ACCORDING to the Hamilton "Spectator," the slogan under which the street railway companies do business in most places is "The Public Be Jammed!"

* * *

A SHORT note in a paper announces that the contract for collecting garbage in Brantford has been awarded to a man there. The item concludes by stating that the same individual will shortly start a piggery also. These two may run together quite well, but it doesn't put much of an edge on your appetite to read about it.

# Slightly Easier Tendency Noticed In Some Lines of Steel Plate from Jobbers

## Nothing Has Leaked Out Indicating Which Way The Price Changes Are Going On March 31—Labor Conditions In United States Shipyards Are Much Improved

ALTHOUGH the indication is probably too small to be accepted as indicative of the trend of prices in Canada, dealers are quoting steel plate at a rate ten per cent. off recent prices. One well known firm is willing to accept desirable business at $9 per hundred, although the list price still reads $10. Some of the Canadian jobbers are still in the peculiar position they dropped into when United States set prices some months ago on steel at a figure below that which the Canadians were paying. It resulted in the yards on this side of the line getting stocked at a price that was higher than that at which they could sell. Now they are disposing of their holdings in a very limited market owing to the regulations surrounding the class of business to which sales can be made. An advance in crude oil prices is noted this week, amounting to 10c per barrel in Canadian points and 25c on mid-continent figures. The demand for oil is strong. Dealers anticipate an upward tendency in high speed steel cutters on the American lists. They say the very large demand for this class of product is going to make a good chance for higher values. The scrap metal situation is practically tied up. Dealers claim they are not at all anxious to buy unless the offering be at a figure a half-cent off listed prices. The embargo places business within the confines of Canadian demands, and these can be quite easily handled. A resumé of U.S. conditions leads to the belief that a much more settled era is looked for, although it is impossible to forecast its duration. Big orders are being placed for the equipping of war shops overseas. It is more and more patent that the part U.S. is to play in the war depends on its tonnage. The settlement of labor troubles in the shipping industry is good news, and greater production from the yards means more effective participation in the war.

## SMALL DECLINE IN STEEL PLATE

### Dollar Off List Price for Desirable Business—Oils Have Taken Advance

TORONTO.—Although better transportation conditions have been looked for for several months past, they have not arrived in earnest. The only improvement is in shipments of recent date, which are coming through away ahead of those that have been on the rails for weeks, and in many cases months. The various embargoes, some put on by the roads themselves, others attached by the Government, have tended to create a tie-up that cannot be straightened out in a matter of days or weeks.

The steel market is steady. Several causes may have had much to do with this, and the chiefest probably has been the changing of manufacturing life from a peace to war footing. Now that this has been accomplished the tendency toward violent changes seems to be decreasing, although it may not be very noticeable on the surface yet.

Dealers in scrap metals are in the same position as they were a week ago. There has been practically no change at all. Here, again, the embargo cuts in and stops the shipment of this material from Canada, and of course business being done is confined to much narrower limits.

A tendency is noticed for an easier price in steel plates of certain lines, a ten per cent. mark being spoken of for favorable business.

An advance is noted also in the list price of oils, Royalite going from 17 to 18 and Palacine from 20 to 21. Crude oil is up 10c per barrel, and a mid-continent rise of 25c per barrel is also reported. There is a big demand for all grades of oil and cutting compound as well.

Business is reported brisk in all lines of machinery and supplies, but deliveries are not keeping pace with the volume of trade that is offering.

#### Iron and Steel

Canadian dealers in steel are waiting for the end of the month when the price lists approved by U. S. Government will be announced. It is quite correct to state that Toronto dealers, as far as CANADIAN MACHINERY can learn, are not looking for anything drastic in price changing. A number of dealers in the Dominion are in a peculiar position just now. Plates are listed now at $10 per hundred, but one large dealer said he would be willing to quote $9 for desirable orders. "We have not quite got out of the place we got in after prices were fixed in United States," he stated. "Canadian dealers ordered a large tonnage for various peace times work before the U. S. Government set the price downward. That resulted in many Canadian yards being stocked with material that was bought at a high price. We now find ourselves selling in a very limited field, for buyers are restricted to those who are engaged in work that can secure the sanction of the Government. "Another dealer complains of deliveries. He cited one case of a car that had got its start from Pittsburg on the 10th of January. On the 25th of March Black Rock reported that there was no trace of it.

This one instance of a ten per cent. drop in price is not taken by the trade as showing a general tendency downward. Prices seem steady, with few prospects of breaks.

#### Machine Tools

Price changes are few. Business is good in all lines. The fitting out of several large war plants has resulted in a big demand for oil pumps, with the added request of immediate delivery. Prices for these are holding at the advanced figure announced last week.

Shapers are up slightly, a ten per cent. advance being quoted on these. There is a rumor that the price of high speed standard cutters is going up. The reason for this is the fitting out of a large number of U. S. munitions plants. There is nothing to substantiate this report in actual figures, but when all the circumstances are considered, and the big demand also counted in, it seems probable that the tendency of high speed steel cutters will be upward. Good business is reported in these lines, and in some cases a betterment in deliveries is becoming noticeable.

#### Scrap Metals

Dealers in scrap metals report that their business at the present moment is stagnant. The embargo is still on against the exportation of scrap material from this country, and on that account the dealers are not anxious to go ahead and purchase more, when they have sufficient in their yards for all the Canadian trade that is showing. "The prices that are quoted in CANADIAN MACHINERY, stated one dealer this morning, "are correct enough in that they represent the real value of the market, but they are not the prices that we will pay. If any person wants to trim that price by half a cent or so we might be inclined to take a chance on the business, but otherwise it would be correct to state that we are not in the market for buying now. The

claim of the Government is that by putting on the embargo they will collect a large quantity of raw material in Canada, and in this way encourage manufacturers here. But as far as real business is concerned, we can handle enough scrap in a month to supply the Canadian demand for twelve months." There is some talk of a modification being made in the ruling about the embargo on scrap materials, but it is not beyond that stage at this writing.

### Non-Ferrous Metals

The metal market is feeling the effect of the many restrictions that have been placed around it. These have been in operation long enough to have a combined effect on the Canadian market. Gradually the stocks in the Canadian shops are being reduced, and they are not being replenished in accordance. Dealers see in this state of affairs a higher level of prices, although they are free to admit that they are not anxious to see this time arrive.

Copper.—Shipments of copper are smaller than usual. United States has done a very large export business in this metal, a large amount of it having come to Canada. Russia is not turning out enough copper for her own use, due largely to the unsettled conditions that have been prevailing there. United States sent 80,000 tons of copper to that country last year. The U. S. Government, apparently at the suggestion of the Allies, is purchasing all the available copper, and as no figures are given out any guess as to the volume of trade is bound to be somewhat vague.

**Tin.**—Here the war situation seems to be a dominant factor, and the strained relations between United States and the Dutch Government is helping to make the tin market an uncertain one. The amount of this metal in trade is small, and the chances of securing the filling of orders is not encouraging. Shipments of Straits tin are not to be had. The price remains firm.

**Spelter.**—The gradual falling off in production, which has been quite noticeable since the first of the year, is being reflected in the local market conditions. The price of $11 per hundred remains unchanged.

## POINTS IN WEEK'S MARKETING NOTES

**United States has closed orders, amounting to ten million, for export to France and Italy for war shop equipment.**

**The Weehawken Drydocks Co. have purchased 700 acres of land near Peekskill, where a shipyard will be constructed to cost four million. They will be devoted to work for the Emergency Fleet Corporation.**

**One Toronto dealer stated that he would accept desirable business for steel plate at a dollar per hundred off the prices that have been listed.**

**Deliveries show very little improvement, many of them being weeks and months behind time, and in not a few cases dealers state that they believe their cars have become lost.**

**An advance is recorded in the price of crude oils, amounting to ten cents per barrel in Canada.**

**Dealers in scrap metals are not anxious to buy at all at list prices, claiming they have enough on hand to supply the Canadian trade, to which they are now confined by the embargo regulations.**

**A decided improvement is noticed in the American labor situation, especially in regard to the shipbuilding programme, and a greater production of bottoms is looked for at once.**

## LABOR PROBLEM IRONED OUT NOW

### Arrangements Made That Will Allow Programme to Go Ahead With a Rush

Special to CANADIAN MACHINERY

WASHINGTON, March 23rd.—Price fixing and ships are the subjects consuming the chief interest in Washington at the present time. Industrial leaders are interested in reported movements to further fix prices and claim that unless definite action is taken shortly business will become so unsettled as to be disorganized.

With the German drive under way America is confronted with the problem of ships, for it is admitted that the part the United States can play in repelling the present drive and in further drives depends entirely upon the amount of tonnage which can be made available.

There is more optimism over the shipping problem to-day than there has been for some weeks. This is partially occasioned by the fact that the taking over of Dutch vessels in American ports has given sufficient shipping space to clear docks and warehouses of large amounts of supplies which have been held for weeks awaiting transportation to European points.

### A Better Showing

Moreover there is a decided realization of speedier and better work. Several vessels launched on the Atlantic coast this week have given definite promise that the shipbuilding program of the United States is going forward despite pessimistic predictions of failure. Investigations conducted by the Senate Commerce Committee have acted as a prod and shipbuilders and shipworkers have both turned to with a better spirit and as a result work is going forward with more impetus than at any time since the great program was undertaken.

The labor questions have been ironed out. The Shipping Board has announced that a satisfactory wage scale for Atlantic coast shipbuilders has been reached and this removes a very dangerous obstacle in the path of the shipbuilding program.

Pacific coast shipbuilders have assured the Government that they will surpass their program. Present estimates of the capacity of finished ships from the Pacific coast ports for the year 1918 are 65 steel vessels with a tonnage of 554,900 and 18 wooden vessels with a tonnage of 622,000.

Japan is also reported to have made an attempt to reopen negotiations whereby a considerable portion of the Japanese tonnage in the Pacific would be diverted to the use of the United States and the Allies in the Atlantic. This plan was taken up last summer at the time when the Japanese mission was in this country, but no agreement was reached. Japan, however, is reported to be in need of larger steel supplies to carry on her war program and as a result she is willing to release some of her vessels to the United States in return for a greater supply of steel.

### A Non-Sinkable Type

Chairman Hurley has announced that several experiments are being tried now which will test the possibility of furthering the shipping of the United States. He announces that contracts have been let for three vessels of a tonnage of 15,500. These are the largest vessels yet undertaken by the United States Shipping Board and if they prove successful more contracts of this nature will also be let. The Shipping Board has also widened the scope of its efforts to defeat the U-boat by attempting to secure a non-sinkable vessel. At the present time tests are being made of a vessel of this description, invented by Hudson Maxim, inventor of the Maxim silencer for guns.

In the House of Representatives a bill has been introduced to give the President the power to fix the prices on practically all commodities entering into manufacture. The bill includes provisions for price fixing on wool, leather, hides, steel, cotton, machinery and equipment.

### Those New Prices

According to well founded reports President Wilson is about to announce a new schedule of steel prices. It is understood that the large producers of steel in the United States have held a conference with the President and that an agreement has been reached on new prices. These prices, it is reported, will stimulate production and are expected to work to a considerable degree towards wiping out the prospects for a steel shortage in the United States. It is expected that the new prices will be announced within a few days.

Railroads in the United States have been granted a fifteen per cent. increase in freight rates by the Interstate Commerce Commission. At the same time there come reports that the Railroad Wage Adjustment Board is about to make a report recommending increases in pay to railroad workers to the amount of three and a half million dollars annually.

The War Trade Board has issued its export embargo list. This list includes all articles which can not be imported in the United States during the period of the war. Copies may be secured from the War Trade Board, Washington, D.C.

Reports of bituminous coal production for the week ending March 18 show the largest production since the week of November 24.

Labor conditions in the United States are improving. The Adjustment Board of the Department of Labor announces the adjustment of labor difficulties during March which affected some 50,000 workers. There are few important labor troubles reported at the present time.

## BIG ORDERS TO KEEPS SHOPS BUSY

### American Firms Exporting Much Equipment Now to France and Italy

Special to CANADIAN MACHINERY

NEW YORK, March 23rd.—The Eastern machinery markets are active. Manufacturers of machine tools are making better deliveries on priority orders and it is an encouraging fact that manufacturers of turret and engine lathes are now able to make deliveries in from one to three months, but makers of heavy tools are still far behind in deliveries on contracts. It is significant that smaller premiums are now being demanded by dealers who have second-hand equipment to offer. Prices of new machine tools are without essential change.

#### More Big Orders

The main feature of interest in the last week has been the placing of large orders for export by United States and allied Governments, all of which are to fill war needs. It is estimated that recent contracts for shop equipment closed for shipment to France and Italy have aggregated about $10,000,000 and as much more business is pending. The largest purchases have been made by the French High Commission, including several hundred tools for aviation work. Gio Ansaldo & Co., who have placed orders for $6,000,000 worth of tools already in this country, mainly for shipyards and munition plants, are now buying $5,000,000 worth of machinery, including 200 machines of various types for aviation work. All of the airplanes, ships, ammunition work being executed by this firm is for the Italian Government. Prospective purchases are for plate shop equipment, cranes for shipyards and hydraulic equipment for various plants. This company is preparing to build five additional ship ways and will construct 18 more standard cargo carrying ships. All of the engines and other equipment will be manufactured in Italy of rolled steel and finished steel which is being purchased in this country. Lancia & Co. are also buying tools for the manufacture of aviation motors in Italy through their local representative.

Machinery purchases are being made by the J. G. White Engineering Corporation for the United States Signal Corps in France and the Pennsylvania R. R. Co. has made additional purchases of tools for railroad shops in France serving the American military road. The Sota & Anzer steel plant in Spain is buying 50 cranes and machine shop equipment in this country through Frank C. Roberts & Co., Philadelphia. The purchases will amount to several million dollars.

#### Making Guns

Manufacturers of ordnance continue to place orders for shop equipment, the most notable buying recently being done by the Colts Patent Firearms Manufacturing Co., Hartford, Conn., which is manufacturing heavy type Browning machine guns for the United States Government. The Marlin-Rockwell Corporation, New Haven, is building a new factory for the manufacture of light type Browning machine guns and will soon be in the market for additional shop equipment.

Admiral McGowan, of the Navy Department, is taking bids on 29 machine tools for various navy yards, including engine lathes, boring mills, shapers, grinding machines and drills. The Vulcan Iron Works, Jersey City, will purchase machine tools to install in its plant extension which will be utilized for the manufacture of marine engines for the Emergency Fleet Corp. The United States Government has purchased the manufacturing rights of a standard type malleable iron wheel for army motor trucks. Orders to make these wheels will be distributed among a number of manufacturers who will purchase turret lathes and boring machines.

#### For Shipbuilding

Shipbuilders continue to purchase cranes and shop equipment. The Merchant Shipbuilding of Bristol, and the Chester Shipbuilding Co., of Chester, Pa., are receiving bids on cranes and miscellaneous machinery. The most interesting development, however, is the purchase of 700 acres of land near Peekskill, N.Y., by the Weehawken Drydocks Co., where a shipyard will be constructed to cost about $4,000,000. The Emergency Fleet Corp. is closing a contract with this company for 14 steel ships of 7,500 tons burden, 12 concrete vessels of 3,500 tons and 100 barges.

## FIGURING AHEAD ON PRICE BREAK

### Pittsburgh Trying to Line Up the Situation in Advance of March 31

Special to CANADIAN MACHINERY

PITTSBURGH, Pa., March 23.—Various reports are in circulation, coming chiefly from Washington, regarding Government prices on iron and steel. The conference between the War Industries Board and the producers, called for last Wednesday, extended over to Thursday. While the more common view is that the matter rests entirely with the board, with an announcement in prospect next week after the President has approved whatever conclusion the board may reach, there are rumors that the matter was finally agreed upon at the meeting. The most generally circulated rumor is that the changes, effective after March 31, are simply that basic pig iron will be reduced $1 a ton, to $32 at furnace, with a corresponding reduction in Bessemer, and scrap will be reduced $1 to $2. This report does not have the right ring, as it would make the following pig iron schedule: Basic, $32; No. 2 foundry, $33; malleable, $33.50; Bessemer, $35.20, all f.o.b. furnace, wherever located. It would be good form to put basic below foundry, or rather leave foundry above basic, as furnaces are less disposed to make foundry than basic, but malleable at $1 above foundry and $1.50 above basic would be quite indefensible. As to scrap, it is hardly in line for iron and steel producers to "consent" to a reduction, for it is material they buy, not sell. There may be more extensive reductions than have been hinted at in the schedule as a whole. If not, and with an extension to June 30, as seems more probable than the extension to the end of the year desired by producers, one may well look forward to reductions by June 30.

#### Light Commercial Demand

The outstanding feature of the market situation is the lightness of commercial demand for steel products. There is continued pressure for oil country goods and for small spikes, also perhaps for sheets, and some demand

## FINDING CAPACITY OF CANADIAN PLANTS FOR AMERICAN BUSINESS

Some days ago the rumor was spread that large orders for aeroplane bombs had been placed in Canada. Some papers went so far as to state that contracts for very large amounts were pending, and that it was only a matter of a short time until the work was started.

It is well known that Canadian manufacturers have been sounded in regard to this business, and that several of them have submitted figures regarding the capacity of their plants for such work.

CANADIAN MACHINERY has received the following wire from official sources at Ottawa:

"Replying your telegram 18th, no contract is pending from United States for aeroplane bombs.

"We are ascertaining possibilities of manufacturing these bombs in Canada in order to submit particulars of Canadian capacity to Ordnance Department, Washington."

for deliveries of standard steel pipe, but outside of these items the commercial demand is certainly very light. This condition cannot but be regarded as significant, seeing that Spring has come, when usually there is much heavier demand for steel products, and seeing also that shipping conditions have greatly improved and consumers have a much better opportunity to conduct their operations. There is for instance, no longer any serious shortage of coal among the consuming industries. It is difficult to see how there can be anything but an easier steel market in future. Of course this might not result in sellers going out actively after business. Seeing that they have such a large tonnage of unfilled contract business with their regular customers they are naturally more interested in this business being carried out than in their booking fresh contracts.

### Coke Supplies

Last week's Connellsville coke shipments were a trifle disappointing, seeing that they were 333,953 tons, against 334,584 tons the preceding week, representing a slight decrease, but the preceding week's shipments had represented a large gain, no preceding week in the year having shown as much as 300,000 tons shipped. It is estimated that shipments in the week just ending have been heavier, say 350,000 tons. It is still an acceptable estimate that the requirements of the furnaces depending upon Connellsville coke are about 375,000 tons weekly, so that at this rate the furnaces should soon be fully supplied, as shipping conditions are practically certain to improve more or less steadily. The by-product ovens are receiving very nearly full supplies of coal, so that altogether the blast furnaces are on the verge of full operation, say within a few weeks. It may be mentioned that frequently of late there has been 72-hour "foundry" coke offered in the market. It may not be altogether the best selection, but as long as it is offered to foundries it comes under the $7 set price, whereas if offered to furnaces it could only be at $6.

### Pig Iron Production

Official statistics just issued show the output of pig iron in the United States in 1917 to have been 38,647,397 gross tons, a decrease of 787,400 tons from the 39,434,797 tons produced in 1916, the record year. There was more furnace capacity available in 1917, on account of new construction, and the restriction in output was due almost wholly to shortage of coke. Capacity at present may be estimated at nearly if not quite 43,000,000 tons. Output in the first quarter of this year may be estimated at between 30,000,000 and 31,000,000 tons a year, but the rate now is much heavier than the rate the first nine or ten weeks of the year.

### Lake Superior Iron Ore Movement

Ore producers, lake vessel interests, the railroads and the blast furnaces, are all to co-operate closely in connection with the Lake Superior ore movement this year, the prime essential being to conserve railroad capacity and avoid railroad congestion. Last season the program was to get maximum efficiency from the lake fleet, but the actual experience was that of the railroads serving Lake Erie docks becoming congested, and the docks as well, whereby vessels frequently lost time waiting to be unloaded. The precise requirements of the blast furnaces will be compiled, and no more ore brought down than sufficient. The lake fleet is estimated to have a capacity to move 75,000,000 tons of ore, with no delays at any point, but prospects are it will hardly be called upon to move altogether as much as the 62,498,901 tons it moved last season, this figure excluding the 1,5,825 tons that was shipped from Key Harbor, on the Canadian side. There were 9,515,221 tons of ore on Lake Erie docks March 1, showing how ore accumulated, and how the railroads are behindhand in clearing the docks for the new lake season. The lake fleet has much more capacity than indicated by the movement last year, partly because there was time lost last year, from the late opening and from vessels waiting to be unloaded, partly because there has been more vessel construction than there has been tonnage lost, and partly, indeed largely, because channels have been dredged so that the draft of the largest vessels will be nearly one foot greater this year.

### Market Prospects

Increasing supplies of pig iron and increasing ability to ship finished steel, through the railroads getting in better shape, with continued absence of heavy commercial demand, apart from war requirements, seem bound to make an easier steel market in future. It is true Government requirements continue heavy, but they are running more to certain descriptions of material, leaving other forms of finished steel in relatively light request, and the steel industry can put no more than so much of its raw steel into each finished form. Quite possibly the mills have been indisposed to disclose their willingness to accept orders, by reason of the present price fixing operations in Washington, and when that is out of the way, as it must be before the end of this month, they may show more eagerness to secure business, even possibly to the extent of offering concessions from the set prices in the case of some commodities.

THE aim of belting manufacturers should be to secure the lightest weight consistent with strength, although it has long been thought by many power users that belt weight is an important factor of efficient service. This is entirely erroneous for a belt transmits its power by its surface contact with the face of the pulley, and if its co-efficient of friction can be maintained reasonably high, and elongation or stretch could be eliminated the thickness would be of small importance.

## UNCERTAINTY ABOUT NEXT MOVE MAKES MARKETING A HARD MATTER

Speaking to CANADIAN MACHINERY about the marketing of the product of Canadian factories, Mr. E. Barelman, president of the Gilson Engine Co., of Guelph, stated that there was an element of uncertainty being brought into the situation at present that was working against the men in his line of business. The Gilson people came to Canada ten years ago, and started in a very small way to make gas engines. At present they are making silos and their other lines. They have also investigated the tractor situation very thoroughly, and were prepared to go into this business, but the removal of the duty on these machines, and the refusal of the request for free material has changed their plans in this direction.

"The uncertainty that faces the manufacturers in the way of getting out their production is also facing them in the selling of their finished article. Here is a letter that we received this morning from a firm in Sarnia. We sent them a proposition to handle our engines on a commission basis, and this is the reply:

> "'We might say that your proposition looks attractive. At the present time, however, it looks very much as if the Canadian government would remove the duty from gas engines as well as a number of other farm supplies, which would make very strong competition from United States. Until something definite has been decided it will be impossible for us to advertise any engines.'"

"It doesn't take much figuring," continued Mr. Barelman, "to see where that sort of business is going to land us and the other manufacturers who will be up against the same problem. It's just the same thing with tractors. We have plans out to go into the business here. We are sure we can put a good machine on the market at a fair price. But we can't do it under the conditions that are now laid down by the Dominion government. The only alternative will be for the Canadian factories with an American connection to develop the latter. At the present time Canada is dependent on United States for her supply of tractors, and United States cannot supply the demand for these machines. I don't believe," concluded Mr. Barelman, "that the Canadian manufacturer realizes what he is up against in this particular line. To me it looks serious."

## THE STRENGTH OF AEROPLANE WINGS

IF the aviators who lost their lives in the early years of the flying machine's development could come back to life and gaze upon the great airplanes of this day they would first gasp in astonishment and then they would approve enthusiastically the construction which made it possible for sixty people to crowd upon one half of a huge bi-plane's wings without breaking them. For let it never be forgotten that some of the early martyrs who dropped to a terrible depth from great heights went to their doom because the builders of their machines had no conception of the structural strength required to buffet turbulent winds at high speed.

The wing section of a biplane is supported from a heavy wooden frame and not from the floor. The wing section is held only on one side and extends freely from that side into the air. Judging from their size, the wings are those of an enormous flying yacht. Althoughh the supporting surface could evidently sustain the weight of some 126 passengers, they have not, of course, that amount of lifting power. The crew of the vessel probably amounts to four. Hence the weight for 122 people is available for the boat body, rudders, engines, propellers and supplies something like over eight and one-half tons. Moreover, the human freight clearly does not overstrain the wings.

This example is an object lesson in reserve strength. The stoutest storm-sails of an old-fashioned sailing ship were never subjected to such strains as those which must be endured by that fabric of linen, wires and lattice-work of which the wings of a modern flying machine are composed. A sail needs strength to resist mere tearing alone. A flying machine's wings must in addition be so rigid that they will keep their shape in the worst hurricane. Only the pilot of an airplane knows how his wings are strained when he drops at a steep angle from a height of 5,000 feet in a swift downward glide for home. It must bend no more than if it were made of cast-iron. To this stiffness the modern airplane owes its superior stability.

## TANKS IN 1596

IN the recent exhibition of aircraft held in many great towns both in England and Scotland, full acknowledgment was given to the great genius of Leonardo da Vinci, as being the first to anticipate man's mastery of the air. Should the tanks also be on tour in the future, I [illegible] that one great Scotsman, John Napier, of Merchiston (inventor of logarithms), should be remembered as foreseeing and describing these mighty monsters. In a memorandum (dated 1596), which he calls his "secret inventions," he describes four inventions. They probably owed their existence in his fertile imagination to the rumors of war current at that time and were to be used in defence of his country should the Spanish Armada invade the coast of Scotland. I am only recalling one of them, in which the living presentiment of our modern tank is clearly foreshadowed. These are the words in which Napier describes it:

"A round chariot of mettle made of the proofs of dooble muskett. The use hereof serveth to break the array of the enemies battle, as also it serveth to destroy the environed enemie by continuall charge and shott through small hoalles. The enemie in the meantime being abased and altogether uncertaine what defence or pursuit to use against a moving mouth of mettle."

It is true Napier did not foresee the latest development in our "chariot of mettle," the moving mouth of the monster has been opened in our midst to-day, and opened to some good purpose, for it has been filled with that much-wanted supply of gold and silver on which the sinews of war so largely depend. But allowing for shortness of vision in this detail, we can still claim that the great magician of Merchiston was the man who foretold the coming of the tank.

## MAGNETIC SEPARATORS

THERE are very few instances to be found of greater waste in workshop management than in the usual disposal of the shop sweepings, metal turnings and borings, foundry sand, etc. In the old days many firms considered these materials as not worth troubling about, and many instances are known where large sums of money have been made by merchants buying this material, which was considered by the manufacturers as of little value, and after treating same disposing of it at a high profit. Competition has opened the eyes of many manfuacturers to the value there is in their waste material, and greater efforts are being made to recover the products. This is a necessity even in normal times, but under the existing conditions of life in this world, with the scarcity of metal, it is almost as great a necessity to recover the metals, and see that there is no waste of copper, brass, and gun-metal, etc., as it is to see that no waste takes place in coal, light, and even eatable things. The use of brass turnings and borings reclaimed from the scrap heaps of firms to an extent hitherto unknown has certainly eased the position as regards this metal, but it is up to every manufacturer in the world to look round the works and see what is being sold as scrap and to consider whether it would not be worth while putting down the necessary plant to treat the materials themselves, and so save the profit which would otherwise not be theirs. A practical instance of this occurred recently where a large works had a heap of about three tons of gun-metal turnings containing a very large percentage of iron. They were considered as useless and a dealer was asked to make an offer for them. He offered £5 per ton, but on a sample being passed over an efficient magnetic separator it was discovered that there was nearly 50 per cent. of good metal, and as the market price at that date was about £60 per ton it is obvious what a large sum the firm would have lost had they sold the three tons at £5 per ton. The saving made showed a handsome profit over the cost of an electric magnetic separator to treat just this o ne lot, and left them in a position to treat all future quantities and save the money they were otherwise losing in selling the material. This is by no· means an isolated instance, and is only given as an example to put works managers and manufacturers on the alert to see that no such instances occur in works under their control. In nearly all engineering works the practice in these days is to try and keep separate those shops where iron is being turned and those where metal is turned; but, however careful they may be, it is impossible to keep them separate, and there is always the danger of tools breaking and pieces falling into the metal, so that before the metal can be re-melted it is absolutely essential that the turnings should be passed over an electro-magnetic separator, which will remove the impurities and make a valuable marketable material. Further, there is often a waste of iron in foundry sand. Many firms make a practice of only riddling their sand and getting out the large pieces, but if they would go carefully over it with a horse-shoe magnet they would be very surprised at the quantity which is wasted, and they would soon cover the cost of putting down the plant.

ONE of the interesting problems of science which has been investigated is that of the time taken for a stone to fall to the centre of the earth. In a recent paper to Corrystes Rendus by M. Sauger this question has been carefully worked out. The problem has exercised the minds of many men; Mersenne estimated the time of fall to the earth's centre at six hours; Gassendi, twenty minutes. The latter value is the more accurate, says M. Sauger. If the earth's density is assumed to be throughout of its average value 5.53, then the time of fall works out at 1,234 seconds. The author investigated the problem, taking into account the variation of density with depth and derived a function from the ratio of the principal moments of inertia of the globe afforded by the precession of the equinoxes, and gives results in accord with experiments upon the intensity of gravity in mine shafts. With these assumptions the duration of fall is found to be 19 minutes 15 seconds.

AN interesting fact relating to the undeveloped state of French water powers is contained in a recent issue of *La Nature*. Over nine million horsepower is said to be available for 180 days in the year. Corresponding figures for other European countries show that France is especially favored in this respect, her water power resources being considerably larger than those of Norway, Sweden or Italy, or, in fact, of any other country. It is also interesting to note that although the German available water resources only amount to about one and a half million horsepower per annum, she has utilized 31 per cent. of them, whereas only 10 per cent. of French water power is yet developed.

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## ENGINEERING

Hull, Que.—[illegible] are calling for tenders for the steel work for a reach to step

Grand Mere, P.Q.—Erection of an extension to their plant to cost $150,000 is contemplated by the Laurentide Co., Ltd.

Montreal, P.Q.—[illegible] and [illegible] intend purchasing a 750 gallon per minute, 300-foot lift centrifugal pump. Consulting engineers, M. A. Sammett, McGill Building, Montreal.

## MUNICIPAL

**Melfort, Sask.**—The Town Council contemplates the purchase of Diesel oil engine.

**Strathroy, Ont.**—[illegible] system is to be extended by the purchase of a motor-driven turbine pump.

**Winnipeg, Man.**—The Board of Control is contemplating a municipal gas plant for the manufacture of gas for heating purposes from soft coal.

**Amherstburg, Ont.**—The Town Council contemplates the construction of a water main, to cost $20,000, in connection with the proposed Brunner-Mond water supply agreement.

**St. Catharines, Ont.**—The Fire, Light, and Gas Committee estimates amount to $24,000 exclusive of street lighting expenses. Estimates for the gas plant are being prepared. City engineer, W. P. Near.

**Kingston.**—At the meeting of the City Council it was decided to purchase engines to supplement the power supply for their street railway system. It was anticipated that a ten-minute service can now be given.

## BUILDING

**Ottawa, Ont.**—Votes for Ontario public buildings include: Galt drill hall, $8,000; Hamilton post office, $3,100; Kemptville public building, $1,200; Kingston R.M.C., covered drill hall, $7,500; Kingston R.M.C., enlargement of educational block, $150,000; Toronto postal station "A," $300,000; Toronto Junction buildings, improvements, repairs, $16,000.

## CONTRACTS

**Brantford, Ont.**—The Board of Works has awarded a contract for special castings to the Hartley Foundry Co.

**Ottawa, Ont.**—The National Iron Works, Ltd., Toronto, have the contract for pipe for water mains for the City Council. Cost, $18,600.

**Shawinigan Falls, P.Q.**—Church, Ross & Co., Montreal, have the general contract for $1,800,000 plant for the Ameri[illegible] of the Shawinigan Water and Power Co., formed to manufacture acetic acid.

**Montreal.**—Contracts for $22,000,000 for railway equipment for the Canadian Northern System have been let to the Canadian Car & Foundry Co. This includes more than two thousand cars of all kinds. It is expected that contracts for 150 locomotives will be awarded as follows:—One hundred to Montreal Locomotive Works and 50 to the Canadian Locomotive Works, Kingston, Ont.

## PERSONAL

**John Hole, Sr.**, who for the past two years has been assistant superintendent of construction for the Toronto Harbor Commission, is leaving the commission to enter private practice as a general engineer and contractor.

**Howard Taylor**, who for some years has been chief electrical and mechanical engineer of the Spanish River Pulp and Paper Co.'s plants, with headquarters at the Soo, has resigned to become consulting engineer with the Dayton-Wright Aeroplane Co., at Dayton, Ohio.

**Walter Baker Champ**, who for many years has been secretary-treasurer of the Hamilton Bridge Works Co., and who was last week elected managing director and secretary of the company, was born in Hamilton, March 23rd, 1874. His entire business career has been with the Hamilton Bridge Works Co., having joined that firm when he was 17 years old. He was appointed treasurer of the company when only 24 years of age and seven years later he was made secretary-treasurer. Mr. Champ has been a director of the company since 1910.

**H. B. Smith** was re-elected president of the Owen Sound Shipbuilding Co. on Friday, March 8. This was the time of the annual meeting, when a satisfactory year's work was reported. The officers: President, H. B. Smith, Owen Sound; vice-president, J. W. Norcross; second vice-president, R. M. Wolvin; secretary-treasurer, S. H. Lindsay; directors, Messrs. H. B. Smith, J. W. Norcross, R. M. Wolvin, H. W. Cowan, F. S. Isard, Capt. McDougall and H. Dyment.

**Sir Collingwood Schreiber**, one of the greatest figures in the Canadian railway world, passed away on March 23, at the age of 87, at Ottawa. The death took place at his home, "Elmsleigh," Argyle Avenue, where he had been ailing for some months. Although possessed of a magnificent constitution, his great age obviated his chances of recovery. He died in the presence of his wife, Lady Schreiber, and his two daughters, Mrs. Travers Lewis and Mrs. Lawrence Lambe, the sole survivors. For sixty years the late Sir Collingwood had been actively associated in the building and development of both publicly and privately owned railways in Canada. He had a tremendous share in the laying of transportation systems both east and west, and in the latter part of his career as Deputy Minister of Railways and Canals he helped to wisely administer lines directly under the Government, and subsequently superintended the construction of the Grand Trunk Pacific. For his splendid work in connection with the building of Government lines he was knighted in 1915.

## TENDERS

**Sifton, Man.**—Tenders for "Grading roads" and laying concrete pipe culverts will be received up to Tuesday, April 9th. Plans and specifications can be had on application to R. Hockin, secretary-treasurer, Oak Lake, Man.

**Listowel, Ont.**—Tenders, marked "Tender for High School," will be received until Tuesday, April 2nd, for building an addition and extensive improvements to the Listowel High School, including steam heat and ventilation, modern plumbing, hardwood floors, metal ceilings, etc. Address: W. E. Binning, secretary Board of Education, Listowel.

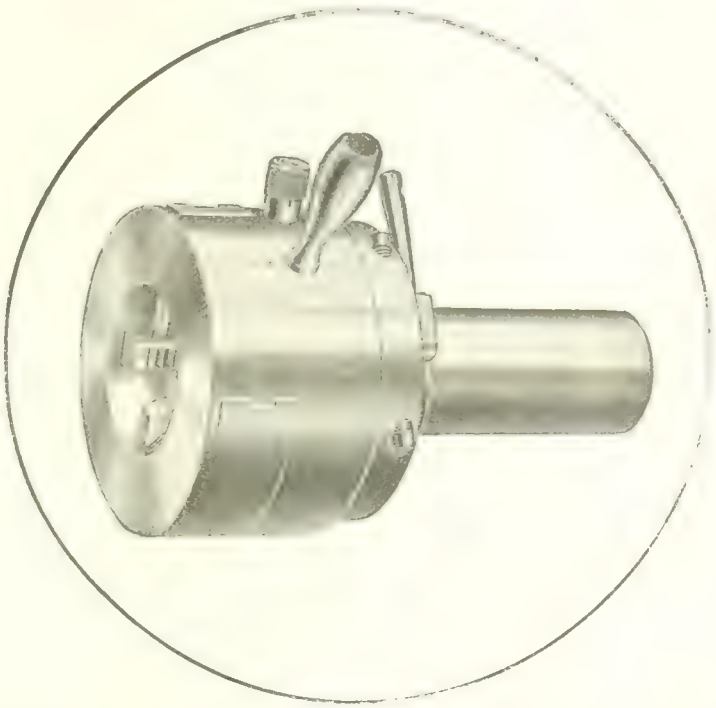
**Toronto, Ont.**—Tenders will be received by Frank Barber, engineer for the Municipal Corporation of the Township of York, up to Saturday, March 30, 1918, for the supply of the following:—450 12-inch cast iron pipes, 1,000 6-inch cast iron pipes, 200 cast iron specials, 112 hydrants, 15 12-inch gate valves, 100 6-inch gate valves. Further information may be obtained at the office of the engineer, 40 Jarvis Street, Toronto.

**Ottawa, Ont.**—Tenders will be received until Tuesday, April 2, 1918, for the construction of a Dominion Government Office Building, O'Connor Street, Ottawa, Ont. Plans and forms of contract can be seen and specifications and forms of tender obtained at the offices of the Chief Architect, Department of Public Works, Ottawa; the Overseer of Dominion Bldgs., Central Post Office, Montreal, and the Clerk of Works, Postal Station "F," Toronto, Ont.

**Toronto, Ont.**—Sealed tenders marked "Tender for steel bridges" will be received by the Toronto and Hamilton Highway Commission, 49 Wellington Street East, Toronto, Ontario, until noon on Tuesday, April 2, 1918, for the supply and erection complete and ready for traffic of bridges over Mimico Creek, Etobicoke Creek, Credit River (bridge and culvert), and Bronte Creek. Form of contract, general conditions, plans and specifications may be seen and obtained at the office of the chief engineer and also may be seen at the office of the city engineer, Hamilton, Ontario.

**Melbourne, Australia.**—Tenders for the following may be addressed to the Director of Navy Contracts, Navy Office,

# GEOMETRIC



**"Around the Geometric Die Head we draw a circle and claim that no other can touch it for quality and quantity production."**

*That is the claim of the Manufacturer.*

*This is the claim of the User:*

> "We purchased four sets 9 16 -18 chasers from you four months ago, and are pleased to state that the first set is still in use and doing perfect work, although it has been used almost daily since purchased, and threading better than a thousand pieces per day."

From 1,000 to 4,000 threaded pieces, according to work conditions, is the reputation of Geometric Die Heads. Unless you know what GEOMETRIC experience is, you have yet to learn what can be accomplished in the production of screw threads.

*We are ready to help you. Ask us about it.*

## THE GEOMETRIC TOOL COMPANY

NEW HAVEN, CONN., U.S.A.

*Canadian Agent*

Williams & Wilson, Ltd., Montreal. The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N. B.

*If any advertisement interests you, tear it out now, lest you forget, and mention it to the paper.*

Melbourne. Supply, delivery and erection at Garden Island of one 200 horse-power prime mover set of either semi-Diesel type or other heavy oil engine direct coupled to 2-65 K.W. 240 volt D.C. electric generating set. All accessories, tank and fittings to be supplied by tenders as per specification. Date of closing, June 7, 1918. Tender forms are open for inspection at the Department of Trade and Commerce, Ottawa. File No. 20,117.

**Ottawa, Ont.**—Tenders will be received until April 11, 1918, for the switchboards, panel boards and transformers required in the construction of the Parliament Buildings. All tenders to be based on the execution, completion, and delivery on the site, together with the furnishing of all material, tools, appliances, labor, etc., for the work as required and described by the plans and specifications for switchboards, panel boards and transformers. Plans and specifications and any other information required can be obtained at the office of the general contractor, P. Lyall & Sons Construction Co., Ottawa.

## TRADE GOSSIP

**Annual Meeting.**—The annual meeting of the Canada Machinery Co., Ltd., will be held at Galt on Wednesday, April 3.

**Open Montreal Branch.**—MacKinnon, Holmes & Co., Limited, of Sherbrooke, Que., have opened a sales office at 404 New Birks Building, Montreal, Que., Mr. W. J. Lochhead being in charge.

**Increased Wages.**—The 25,000 employees of the International Harvester Co., of Chicago, will receive an increase in pay amounting to approximately ten per cent. on April 1st, it was announced.

**Orders For Box Cars.**—Hamilton has secured a share of the $22,000,000 railroad equipment order placed by the Federal government. The local order is for one thousand 40-ton box cars, amounting to $2,750,000, and goes to the National Steel Car Co.

**Extension of Time.**—The C. N. R. is making application to Parliament for an extension of the time for the construction of a line from its authorized line between Port Arthur and Sudbury to a junction with the National Transcontinental east of Lake Nipigon.

**Organ Makers Moving.**—Messrs. Warren & Son, pipe organ manufacturers, of Toronto, are moving their plant and business to Woodstock. They have leased that part of the Hay Company building that was built by the late James Hay, especially for pipe organ building.

**Want Harbor Fixed.**—The municipalities of Brantford, Paris, Galt, Waterford, Preston, Kitchener and Simcoe are organizing to urge that the Government should improve Port Dover harbor at the lake end of the L. E. and N. line. They point out that at present the road carries 270,000 tons of coal, while the places it serves have a consuming capacity of 500,000 tons. Opposition is growing to the Grand Trunk retaining control of the Dover harbor, the contention being that it should be open under Government supervision.

**Industries Coming.**—New industries are going to Windsor and the border cities at the rate of one a month or better. Industrial Commissioner Sclanders reports to the council that since August 18 last, when he assumed his duties here, the following new firms have opened up: Standard Foundry and Supply Co., Tanlac Co., U. S. Playing Card Co., Liberty Motor Co., S. C. Johnson Co., Cadwell's Sand, Lime and Brick Co., Wayne County Fanning Mill Co., White Typewriter Rebuilding Co., Beaver Truck and Tractor Co., and N-Fuel Co.

**Blast Furnace To Reopen.**—According to F. S. Wiley, who returned to Port Arthur after a business visit to Ottawa, negotiations are now in progress and will be completed within a few days whereby the blast furnaces of the Atikokan Iron Company at Port Arthur will be in operation very shortly. It is understood that the Imperial Munitions Board will operate the furnaces and they will be worked to their full capacity for the manufacture of pig iron. The blast furnace in Port Arthur has been idle for about ten years. It was formerly operated by McKenzie and Mann interests.

**Dominion Public Works Appropriations.**—Public works votes chargeable to capital include an additional $1,500,000 to cover cost of construction of the new Parliament Building at Ottawa, and $1,000,000 for the new departmental building at Ottawa. Harbor and river votes under this head include $350,000 for improvements at Port Arthur and Fort William, $150,000 for improvements at Vancouver, and a similar expenditure of $166,000 on Victoria Harbor, B.C. The total vote for public buildings chargeable to capital is $2,620,000, as compared with $2,125,000 for the current fiscal year, a considerable increase. On the other hand, harbor and river votes chargeable to capital will decrease from $5,931,000 to $1,836,000.

**British Orders in Canada.**—British orders for munitions to the value of some $880,000,000 have been placed in Canada. In April, May, June and July last the amount of British orders ran as high as from forty-five to fifty million dollars a month. Since then there has been a diminution of orders owing to the growth of the munition industry in Great Britain, and also in some measure to the shipping situation. To-day, however, the Imperial Munitions Board is still expending about twenty-five million dollars a month in Canada on behalf of Great Britain. The largest type of shell now being produced is a 6-inch high explosive howitzer shell, and the manufacture of fuses has to a great extent been discontinued.

**Ottawa, Ont.**—Votes for Ontario harbor and river improvements chargeable to income include the following:—Bayfield, repairs to pier, $4,000; Cobourg, repairs to Langevin pier, $10,000; French River dams, repairs and maintenance, $3,000; Goderich, repairs to lumber dock, $3,000; harbors and rivers generally, repairs and improvements, $65,000; Kingston, maintenance and operation of combined roadway, wharf and bridges, $8,500; Port Bruce, repairs to pier, $2,100, Port Burwell, repairs to piers, $14,600; Port Colborne, repairs to breakwaters, $7,400; Port Hope, harbor improvements, $24,000; Port Stanley, harbor improvements, $77,000; Rondeau harbor, repairs to piers and placing riprap, $4,000; Saugeen River at Southampton, repairs to piers, $4,000.

**New Railway Co.**—The Montreal, Joliette, and Transcontinental Junction Railway Co. is applying for incorporation of a company under the name of "Montreal, Joliette and Transcontinental Junction Railway Company," with power to lay out, construct and operate a railroad from a point in or near the City of Montreal, in the Province of Quebec, in a northerly direction through the Counties of Hochelaga, L'Assomption and Montcalm to a point in or near the town of Joliette, in the County of Joliette, thence in a north or north-westerly direction to a point in or near the Village of St. Michel des Saints, in the County of Berthier, and thence by the most feasible route to a point on the National Transcontinental Railway, about 180 miles, and that the railway of the company be declared to be a work for the general advantage of Canada.

**Season Starts Late.**—Owing to the ice being heaviest in years the opening of navigation this season will be later than usual. Shipowners at Goderich, however, are busy getting the steamers in shape. Capt. Dan Cornett, of Owen Sound, has fifty men working on the steamer Sarnian, raising the masts, putting a new floor in the engine room, changing the wheel and making other improvements. The steamer Matthews, owned by the same company, is also undergoing extensive repairs. Both vessels will be fitted out with wireless apparatus before they sail. The barge Mary McLaughlin, which had some trouble in making the harbor last fall, may require considerable repairs, as she struck the breakwater after breaking away from the vessel towing her. A big rush of grain is expected at Goderich at the opening of the season. The first trip between Detroit and Toledo was made on the 21st by the steamer Wauketa. No ice was encountered on the trip.

**Will Need Supplies.**—United States trade agents in Serbia report as follows, and the information may be of value to Canadian manufacturers: — Household utensils, as well as the food which is to be cooked in them, will be much needed in Serbia as soon as that Serbian territory which is now in the hands of the enemy is recovered. Department of Commerce information is to the effect that in Serbia American manufacturers may anticipate a market for many articles. Tin plate for canning purposes will be wanted, as well as corn, wheat, flour, hard-tack, dried vegetables, lard, eating oil, canned meat, milk, coffee, tea, sugar, shoes, leather, clothes, cotton, wool, iron and steel bars, galvanized sheets, and tin plate. Here are a few of the things needed by Serbia: Tractors, plows, harrows, rollers, seeders, cultivators, mowers, reapers, scythes, com-

## MARINE

**Charter Cancelled.**—In the Ontario "Gazette" notice is given this week of the cancellation of the charter of the Collingwood Shipbuilding Co. March 25 is fixed as the date of dissolution.

**Victoria.**—That 4,001 men are being employed in the shipyards of British Columbia controlled by the Imperial Munitions Board was a fact brought out at the afternoon session of the shipyard wage inquiry recently.

**Kingston.**—The Pyke Towing and Salvage Company shipped pumps and outfit to Trenton to raise the steamer "Rideau Queen," sunk in fifteen feet of water. As the boat lies partly on her side and in an eight-mile current, considerable difficulty is expected.

**Ottawa, Ont.**—Appropriations for public works chargeable to capital include $550,000 for Toronto harbor improvements. The sum to be voted is $450,000 less than was voted last year, and moreover includes a revote of $250,000, unexpended, of last year's appropriation.

**Port Wade.**—Capt. Howard Anderson, H. B. Short, of Digby; Joseph Gaskill, of Grand Manan, and Capt. John W. Snow, of Port Wade, are establishing a shipbuilding plant at Port Wade, just across the harbor from Digby, and will commence at once a three-mast schooner.

**Sault Ste. Marie.**—Ferry service between the two Soos was resumed on the 22nd by the ferry Algoma breaking through the icebound channel after an interruption of two months. Very little trouble was encountered, the trip being made in ten minutes, about the usual running time. Regular schedule trips will begin shortly.

**Vancouver, B.C.**—The British-American Shipbuilding Co. is negotiating for a site for a plant on the Kitsilano Indian Reserve. Plans provide for the laying of eight keels at once and a building programme of about $12,000,000. Dredging to cost $60,000 may be required. S. Mathieson, of Vancouver, is interested.

**Kingston, Ont.**—Just as soon as the harbor is cleared of ice the Kingston Shipbuilding Co., owned by the Canada Steamship Lines, will launch another trawler. Within a year the company has turned out four trawlers. They will be put into commission on the sea, the estimated cost of each being $75,000. The company has a big staff of men at work.

**Sandwich.**—Backed by the Border Chamber of Commerce, the Town Council will petition the Dominion Government to establish shipbuilding yards here. Local financiers are willing to help build a plant, providing the Government will guarantee orders for merchant ships for service between Canada and Great Britain. River front property between Hill and Brock Streets has already been leased.

**Annapolis Royal, N.S.**—The launching of the new three-mast schooner Hilda M. Stark, 172 feet long and 648 tons gross, at the local shipyard, was successfully accomplished at 11.35 March 4, having been unavoidably postponed from Tuesday on account of the storm. The laying of the keel for another three-mast schooner of about the same size will begin at once at this yard, and a larger four-mast vessel will be put in frame at the same time.

**Yarmouth, N.S.**—The old time shipbuilding property here, which in the years when Yarmouth became known the world over by her shipping was owned by the late Mr. James Jenkins, is once more to become a shipyard. A lease of the property immediately north of the old Jenkins homestead has been taken by a company now being promoted, and work preparatory to building will commence next week. Their first vessel will be a schooner of 300 tons, and Mr. Deveau expects to have the keel stretched by the first of April.

**Halifax, N.S.**—Capt. Lemedec, master of the Mont Blanc, with which the Imo collided in Halifax harbor on December 6 last, causing the explosion which wrecked a portion of the city, has left the province, so the Supreme Court of Nova Scotia was informed recently. L. A. Lovett, who appeared on behalf of Captain Lemedec, stated that following his discharge under the writ of habeas corpus, and not having been notified of any possible review of the case, he had left the city and the jurisdiction of the court.

**Windsor.**—Capt. Fred. J. Trotter, of Amherstburg, has been awarded the contract of raising the lightship Falken, which was sunk by the ice during the winter and is now lying off Scudder's dock at the north end of Pelee Island. The lightship was formerly a Norwegian whaling steamer. It remained at its station last fall so late that the ice prevented it making port at Amherstburg. Capt. Trotter, who is now assisting the crew of the lighthouse tender Aspen to recover gas buoys lost in the ice last winter, will leave for Pelee Island next week and make arrangements for raising the Falken.

**Owen Sound.** — Robert McMenemy, lighthouse keeper at Otter Head, has disappeared. McMenemy had been lightkeeper there for several years, being appointed from the Port Arthur district when the light was first placed there. He had carried on his work regularly and without accident until the close of navigation last fall; but after the lights had been ordered out he failed to report in as usual. Little was thought of it for a few days, as delays might have occurred; but when time passed with no news from him a party was sent out by the Sault Paper Co. from their camp at Pukosoi, a short distance from Otter Head, in search of the missing man. When the searchers reached Otter Head they found the lighthouse deserted; but a note had been left by McMenemy, which read:—

December 11, 1917. "Am leaving to-day. Am a very sick man, and do not expect to reach home alive." That was all. Since then no trace has been found of the light-keeper.

## RAILWAYS

**Ottawa, Ont.**—Railway votes include one million dollars for the construction of Hudson Bay Railway terminals. Government railway votes total $18,000,000, as compared with $31,000,000 last year.

**Ottawa, Ont.**—Railways and canals votes chargeable to income include, in addition to the I.C.R. and Hudson Bay Railway votes, $700,000 for the Quebec Bridge, $1,860,000 for the Welland Ship Canal, $500,000 for the Trent Canal, and $250,000 for the National Transcontinental Railway.

## INCORPORATIONS

**Arthur Balfour & Co., Ltd.**, have been incorporated to carry on the business of steel manufacturers, iron founders, etc. John L. Milner, of Toronto, is attorney.

**The Dillon Mfg. Co., Ltd.**, has been incorporated with a capital of $75,000. The incorporators are: R. B. Dillon, G. R. Dillon, W. G. Henderson, O. R. Durrant, and H. Rolston. They will deal in and make barn and stable fittings, etc. Head office, Oshawa.

**The Montreal-Kirkland Gold Mines, Ltd.**, has been incorporated to develop and deal in mines, mineral lands, etc., and refine ores. The provisional directors are: G. P. Cousins, S. Vineberg, and R. Stuart. The capital is one million dollars, and the head office is at Kirkland Lake.

**The Aetna Gold Mines, Ltd.**, has been incorporated to acquire, own, lease, prospect for, open, develop, etc., metals and minerals. The capital is placed at one million dollars, the incorporators being: S. S. Mills, D. W. Saunders, W. P. Torrance, E. G. Goodwin, P. Home, R. H. Wilson, and M. Walsh, all of Toronto.

**The United Inspecting and Testing Laboratories, Ltd.**, with head office in Toronto, and capital of $40,000, has been incorporated to inspect and test materials and engineering equipment and carry on engineering work. The provisional directors are: N. H. Manning, R. J. Marshall, L. S. Rogers, R. R. Deans, and L. S. O'Dell.

**Waltham Watch Co., Ltd.**—This firm has been incorporated by L. A. David, L. P. Crepeau, S. H. R. Bush, G. Whittaker, and J. P. Callahan, for the purpose of carrying on business, wholesale and retail, of the manufacture and dealers in watches, clocks, compasses, marine instruments, etc. The capital is named at $500,000, and the head offices of the company are located in Montreal.

**F. A. Fish Coal Co., Ltd.**, is the name taken by a firm incorporated by M. L. Gordon, C. McKay, W. B. Sturrup, T. S. H. Giles, and J. W. Bicknell, all of the City of Toronto, to purchase and acquire the assets and good-will of the business formerly carried on as the F. A. Fish Coal Co. The capital stock is placed at

## Imports may be restricted from States

**American made luxuries may not be allowed into Canada—Business Must be prepared for Adjustments.**

"Relations with the United States are a vital factor in the business situation at the present time. The exchange problem has become one which is receiving the serious consideration of the Government."

Late reports from Ottawa indicate that in order to right our balance of trade, steps may be taken to curtail shipments of luxuries from the States into Canada.

### Canada's Dollar at a Discount

These important points are from the front page of THE FINANCIAL POST this week. In another important article on the same page the statement is made that a trade balance of 128 million dollars is a reasonable cause for the existing heavy discount on the Canadian Dollar in the United States. In both articles, and in many other important business articles in THE FINANCIAL POST this week, the inevitable need for far-reaching readjustments in business, and the paramount necessity for more production in the Dominion are emphasized. For the business man anxious to keep pace with and profit by the unusual and rapid developments now taking place THE FINANCIAL POST at $3.00 per year, is the right paper to read.

### Business News of the Week

In this week's issue of THE FINANCIAL POST you will find in addition to the important matters mentioned above, these other business news articles. All are written to give you the most and latest facts quickly and with the least effort in reading. These are merely a few of the news matters dealt with:

**Would Scrap Management of Toronto Rails**
**Big Profits for Canadian Car Co. This Year**
**C.P.R. Assets Pass Billion Dollar Mark**
**Farm Products Are on Higher Price Levels**
**Eastern Steel Made No Profit on Munitions**
**Developments re the Dominion Permanent**
**Supremacy of the Bank of Montreal Maintained**
**Bank Clearings Show Improvement**
**Bank Plans re Conscription Being Discussed**
**Edmonton Not Allowed to Recalculate Sinking Fund**
**Winnipeg Rails Showed Only 1 Per Cent. on Common**

The business man able to give an opinion from knowledge of the facts of these matters and many others of immediate business interest which are contained in this week's FINANCIAL POST would be recognized at once as an alert man of affairs. You can be that man every week in the year if you take the right step now by signing this order for THE FINANCIAL POST:

The MacLean Publishing Co.,
153 University Ave., Toronto

Send me THE FINANCIAL POST each week till further ordered. I will send subscription price ($3.00 per year) on receipt of bill, or you may draw on me for this.

$100,000, and the offices of the company are in Toronto.

**The Consolidated Equipment Co., Ltd.,** has been incorporated to carry on business as general merchants, importers, manufacturers, etc., for iron, steel, metals, rails, tools, machinery, locomotives, railway cars, trucks, wheels, etc., and to act as agents for the same. The capital stock is $25,000, and the incorporators are: H. Ewan, J. H. Dunlop, Montreal; H. B. Laduke, N. A. Collins, J. T. Barlow. The offices of the company are to be situated in Montreal.

## BOOK REVIEW

**The Darling Digest** is a 16-page monthly bulletin recently issued by Darling Bros., of Montreal. The first copy of this booklet, just off the press, is in keeping with the high standard of the other publications of this firm. The subject matter of this book is compiled in a very instructive yet interesting style, and the object is to give to the readers the gist of the Darling products in an interesting yet educational manner. The technical articles and data pertaining to their various lines of products have been prepared by experienced engineers, so that the readers are assured of reliable information respecting the operation of this firm's equipment. In addition to the "shop talk," the booklet contains a brief digest of many of the current events that adds to its educational value.

## CATALOGUES

The Vanadium-Alloy Steel Co. have issued their stock list of "Red Cut Superior" high speed steel, dated March 19.

**New Safety Switch Bulletin.**—Safety auto-lock switches are described and illustrated in some detail in special publication No. 1585-A, just issued by the Krantz Mfg. Co., Inc., of Brooklyn, N.Y. These switches are designed for use on circuits wherever the ordinary knife switch may be applied. They are especially designed for safety, it being absolutely impossible to touch the live parts regardless of the position of the switch or of the door. They are particularly adapted for use in steel mills, factories, mines and other similar locations where men are employed who have no practical knowledge of electricity.

**Electrical Heating Publication.**—Of interest to everybody connected with the heating of baking, drying, and japanning ovens is a reprint just issued by the Westinghouse Electric and Mfg. Co., of East Pittsburgh, Pa. This includes an article, "Electrically Heated Japanning Ovens," by C. F. Hirshfield, reprinted from the N.E.L.A. Bulletin, and "Heat Calculation for Baking and Drying Ovens." by W. S. Scott, reprinted from the "Electric Journal." Thus there are grouped under a single cover an article giving general considerations in favor of electrical heating for this purpose and an article giving the detailed method of calculation for the amount of heat required to raise the temperature of the work, of the supporting and carrying parts, such as trucks, and of the ventilating air. How

to compute the losses from the external surface of the oven and the heat required to raise the temperature of the oven walls, etc., are also given. This publication should be of much value to central station solicitors, who are endeavoring to interest their customers in the electrical heating of ovens, as well as to present and prospective users of such equipment. Copies will be furnished on application to any Westinghouse Electric branch office for Reprint 66.

## TRADE INQUIRIES

THE following trade inquiries have been received by the Department of Trade and Commerce. Further particulars may be obtained from the Inquiries Branch of the Department, Ottawa:

118. **Wire goods.**—A Liverpool firm asks for quotations on ton lots of wire nails, 1½-inch up to 6-inch. Prompt delivery desired.

120. **Hairpin wire.**—A firm of manufacturers in France wishes to secure supplies of wire for hairpins 11/10 thickness. They would like to have samples sent by parcel post, with particulars regarding prices per 1,000 kilogrammes.

121. **Barytes.**—A Liverpool firm of mine owners and paint manufacturers, who are large consumers of the above, makes inquiry for a Canadian source of supply. Finely ground barytes of good color desired.

122. **Antimony deposits.**—A Liverpool mines, agent inquires on behalf of a client for antimony mines or deposits to lease or purchase. State fullest details and terms to acquire.

123. **Kieselguhr.**—A Liverpool mines' agent would like to hear from holders of deposits of kieselguhr of a good white color.

125.—**Liquid carbonic gas.**—A firm in Kingstown, St. Vincent, is inquiring for manufacturers in Canada of liquid carbonic gas for use in making aerated waters.

126. **Cultivators.** — A Johannesburg (South Africa) firm is desirous of closing an agency arrangement with any Canadian concern prepared to manufacture the cultivator, particulars and illustrations of which may be seen on pages 400-401 of No. 737 issue of the "Weekly Bulletin." This firm is prepared to guarantee the sale of large quantities each year.

W. B. WOODHOUSE recently gave some interesting figures relating to the per capita consumption of coal in England and the United States. In the United States the production of coal per man was 660 tons, as against 250 tons in Great Britain; in the textile clothing trade, the annual value of the production per person employed in the United States was £484, as against £158; the primary cause for the difference was that American industry used approximately three times as much power as was used in England in corresponding trades. The solution of the problem was the more economical use of fuel and the cheapening of power supply, the one being a consequence of the other.

HOW to tell a GOOD File by the tang

First, understand what we mean by "good." Even an ordinary file may, for a time, do fast work on soft material. A file, to be what we term a *good* file, however, must do fast work on the hardest, the toughest material, and continue to do it long after the teeth of a common file would be worn smooth. A file made of

Crucible Steel

is the only file able to retain sharp cutting teeth against hard metal.

Therefore only a crucible steel file meets our idea of a good file.

There is but one line of files from 3 to 24 inches made absolutely of crucible steel, and they're backed by 50 years of file-making experience. You can tell them by this trademark on the tang

# Dominion Steel Foundries, Ltd., Have Done Much Already to Solve After-War Problem

## When Munitions Orders Fell Off In Fall Of 1917 Move Was Made To Take Care Of Capacity Of Open-Hearth Furnaces — Developing A Line That Has Previously Been Imported

THE Dominion Foundries and Steel, Ltd., of Hamilton, have to a large extent anticipated their after-war problem. When the first break came in munitions orders in September of 1917 the officials began to investigate other lines to which their plant could be turned. They decided there was a good chance for the making of agricultural shapes, plow standards, etc., and at once turned to develop these and kindred lines. The business has now gone past the experimental stage. It has been a success, and as yet it is in its infancy.

### Growth of the Company

The company was organized in 1912 as the Dominion Steel Castings Co., C. W. Sherman being the organizer and chief executive of the new concern. In the following year, 1913, the new firm became amalgamated with the Hamilton Malleable Iron Co., and then took the name Dominion Steel Foundries. In 1916 the Hamilton Steel Wheel Co. came into existence, and the year following another amalgamation was completed, taking in all the above under the firm name Dominion Foundries and Steel, Ltd. At the present time it is the holding company for the above-named corporation, and will eventually become the operating company as well.

### The Officers

The officers of the Dominion Foundries and Steel, Ltd., are as follows:

President—C. W. Sherman.

Vice-President—W. J. Verity, Brantford.

Secretary—A. G. Wright.

Directors—C. W. Sherman, W. J. Verity, J. J. Harty, Kingston; S. A. Crone, New York; Robert Hobson, Hamilton; Paul J. Myler, Hamilton; W. E. Phin, Hamilton; E. H. Ambrose, Hamilton; F. A. Sherman, Hamilton; A. G. Wright, Hamilton.

### Rapid Development

Cold figures sometimes are quite effective in telling the story of growth and development. When work was started in Hamilton there were 100 men employed. To-day the firm has between 1,700 and 1,800 working in the various factories under its direction. When C. W. Sherman organized the Dominion Steel Castings, Ltd., in 1912 it was the intention to go into the manufacture of steel and malleable castings, but the malleable business was never developed, the main product being steel castings for locomotives and cars and special lines for railway equipment.

### Munitions Business

The company has had signal success in the development of the munitions industry, having been interested in various stages of the output. It was in April of 1915 that they turned out the first 4.5-inch shell blanks and their first shrapnel. Since then, up to September of 1917, the output has been large, rejections few in number, and results very satisfactory. In that time they machined shrapnel, 4.5, made shell blanks for 4.5, 60-lb., 6-inch, 8-inch and 9.2-inch; forged 6-inch, 8-inch, and 9.2-inch. The sole work now is on 6-inch shell blanks and forgings, which are being turned out at the rate of 100,000 per month.

TWO HIGH PLATE MILL AND ROPE TRANSMISSION

### Opened Plate Mill

The management could see that in time the munitions business would cease, and the next problem was to secure an outlet for their open-hearth capacity. Not long after the Dominion Foundries and Steel had their plate mill in operation the embargo was placed on the exportation of plate from United States. This gave the Hamilton mill a very favorable position early in its career. Other lines were affected by the embargo, and the Hamilton mill began the manufacture of plates for railway cars and automobile frames, as well as the agricultural lines. The initial installation consisted of one mill, the success of which was sufficient to justify the installation of duplicate equipment.

### Product

The product at present being turned out consists principally of agricultural steel for plow standards, land sides, shears and discs, etc. The plate rolled at this mill is also suitable for conversion into diaphragm plates and automobile frame steel, tire steel for farm tractors, etc. The steel is all of high grade quality and made to any analysis, as required for the different purposes for which it is to be used. The plates are rolled from No. 15 gauge to ¾-inch thick and any width up to 24-inch. The company was in a particularly favorable position to embark on a venture of this description, as the ingots from which the plates are rolled are cast in the foundry adjoining, which had been in operation for some years. The plate mill thus became a branch of the company's regular business and at the same time is indicative of the extended activities which have been undertaken in recent years. The company has embraced an opportunity of manufacturing a product not hitherto made in this country, but one for which there is an extensive demand. The management believe that they are in a position to supply the entire agricultural machinery trade in Canada with the product such as they are now manufacturing.

### Plant Layout

Construction of the mill building was commenced early in July last, and such good progress was made that the first shipment of plate was made on October 25 last, and it is interesting to note that the shipment in question was made to Tien-Tsin in China. The building is 168 feet by 197 feet and adjoins the company's main plant. The building is of steel construction and arranged in three open bays. The first bay contains the furnaces, the second the mills and ingot floors, while in the third

are located a number of steaming machines of different types. Tracks from the steel foundry run into the middle bay for delivering ingots to the floors near the furnaces, the ingots being handled inside by the means of a Shaw 10-ton, electrically operated, overhead travelling crane, having a span of 60 feet. Another crane of the same type

BATTERY OF OIL FIRED INGOT HEATING FURNACES IN PLATE MILL

operates over the third bay, serving the shearing machines and plate piles, also used for shipping finished plate, all of which is shipped from this bay by a railway switch running parallel with the building.

### Furnace Installation

The furnace installation consists of three ingot-heating furnaces, one combination pair and sheet furnace and a large annealing furnace. The ingot furnaces each have a hearth surface of 120 square feet and the annealing furnace has 500 square feet of hearth surface. All the furnaces are oil fired, the oil being delivered under pressure to the furnaces, where it is mixed at the nozzles with air at a pressure of 50 lbs. per square inch. The charge in the ingot furnaces ranges from 15,000 to 18,000 lbs. each. The heat varies according to the carbon content of the steel.

The annealing furnace has tracks on the hearth, upon which rests a set of cast iron balls carrying a cast iron cradle capable of holding 20 tons of sheets or plates. After being in the furnace for a time the sheets are then taken out and remain in the box about twenty-four hours and allowed to cool slowly. The combination pair furnace is really a sheet mill proposition, but can be used for the lighter gauges of plate. It is so constructed that the waste heat from the pair furnace passes over a brick arch, and is used again in the front or sheet heating end in connection with the annealing process. In the rear end the charging doors are at the side, whereas in the front furnace the doors are at the front. There is an overhead runway from the ingot furnaces to the mill to facilitate the handling of the ingots.

### Rolling Mill

The mill is a two high plate mill, the installation consisting of three stands of rolls and a cogging stand. The roughing rolls are 26 in. by 60 in. and the finishing rolls 26 inch by 38 inch and 26 inch by 32 inch respectively. The ingots are carried from the furnace to the roughing mills and broken down. The steel passes through the roughing rolls on to a large table known as a lifting table, which is operated by air pressure. The table rises, elevating the steel, which is then passed back over the top roll to be put through the mill again. This operation is repeated several times when the steel is transferred on an electric transfer buggy to the finishing mill, where the plate is given the proper gauge and surface. During the breaking down operation great care is taken to remove all scale which forms on the steel. The reduction in the roughing mill is provided for by a screw-down arrangement electrically driven and controlled by the operator, who has a dial in front showing the relative distance between the rolls. The mill is driven by an electric motor through a rope drive.

### Mill Transmission Details

The mill is operated by a Bullock electric motor through a rope drive of the American type, supplied by Dodge Mfg. Co., Toronto. The motor is a 500 h.p., 2,200 volt A.C. machine, operating on Hydro power and of specially strong construction for mill work. The motor is situated in a room adjacent to the transmission, and to the left of the mill. This drive is an interesting sample of rope transmission. It is an endless rope of Manila, 2,800 feet long and 1¾ in. diameter. The rope feeds from the under side of the extreme left-hand groove in the smaller sheave round the idler and back to the top of the sheave on the opposite side, then across to the big sheave. Each sheave has 28 grooves. The motor and smaller sheave run at 380 revs. per min., the big sheave at 120 revs. per min., and the mill rolls at 32 revs. per min., the gears in the mill line providing for the necessary reduction in speed.

### Shearing Machinery

The plates after passing through the finishing mill are placed on a cooling bed. They are then carried to the hot shears and cut into lengths. This machine is a Long & Alstatter, motor-driven gate shear, having 60-inch knives and capable of shearing stock up to 1 inch by 20 inch cold. The plates after being cut to length are sheared into blanks and into various shapes into machines equipped with specially designed knives. There is also installed a gate shear for trimming light gauge stock. This machine has 126-inch knives, and was built by the United Engineering Co., Pittsburgh. Shearing for agricultural stock requires skilled labor and special knives to suit the work.

### Pickle Department

The pickle department is located in a separate building, which is situated so as to allow immediate loading of the steel in railroad cars for shipment as soon as the pickling process is completed.

TRIMMING SHEARS HOT SHEARS AND STOCK PILES

The pickling house is equipped with a 2-ton overhead electrically-driven crane and industrial tracks, etc. No agricultural steel is pickled, but all automobile frame steel is treated, the process con-

sisting of thoroughly cleaning in a sulphuric acid bath 7 per cent. solution, and afterwards covering the steel with a coat of lime to prevent rusting. The company pays particular attention to the quality of steel used in the manufacture of the finished product, and has been successful in producing a fine quality steel, particularly suitable for the purpose for which it is required. The quality of the steel is claimed to be better for its purpose than any manufactured on this continent. T. L. Crossen, who is superintendent of the plate mill, has been in charge since its inauguration. Mr. Crossen has been engaged in plate mill work for a number of years, and came from Pittsburgh to take charge of this plant.

SHEARS FOR AGRICULTURAL STEEL, ALSO SHOWING STOCK PILES

### SHIPBUILDING CO-OPERATION

About forty representatives of the steel shipbuilding industry on the Great Lakes, with leaders of labor, were in conference at Ottawa on March 27 with members of the Government regarding the shipbuilding program which is being entered upon. There had been some prospect of disagreement on wages, but at the conference all parties expressed a willingness to amicably co-operate in carrying out a plan which is recognized as vital to the allies, while at the same time being a source of great industrial prosperity to the Dominion.

At the conference the Government was represented by the Prime Minister, Hon. C. C. Ballantyne, Hon. T. W. Crothers and Hon. G. D. Robertson. Sir Robert Borden, in his address, pointed out the great need of shipbuilding to aid in overcoming the allied shortage, and appealed alike to employers and employees to amicably co-operate, so that the product could be turned out with the utmost speed.

Hon. C. C. Ballantyne, after concurring in what the Premier had said as to the need of ships, stated that the Government policy was not for the war alone, but contemplated a permanent national industry in shipbuilding. Canada, he said, proposed to be self-contained as regards her marine requirements. Mr. Ballantyne referred to the contract concluded with the Dominion Iron & Steel Co. for the construction of a plate rolling mill as a great advance step. The contract called for 250,000 tons of steel plates, and extended over a period of five years. The guaranteed minimum was 50,000 tons a year, but 75,000 might be taken. The estimated cost of the mill was $5,000,000, and a year would be required before the plates could be turned out.

The minister stated that it was the policy of the Government to order ships at a fixed price per ton, and it was therefore very necessary to ship-owners to know the rate they would have to pay, particularly as 60 per cent. of the cost was labor.

He urged strongly that a scale of wages be fixed for at least one year. He further pointed out that the present capacity of the yards was 250,000 tons.

P. M. Draper, Secretary of the Dominion Trades and Labor Congress, speaking for organized labor, fully realized the natural necessity of shipbuilding, and spoke hopefully of employees and employers agreeing, while Mr. Smith, head of the Collingwood Shipbuilding Company, expressed similar sentiments.

There is little question that any prospective difficulty will be obviated.

### FIRMS WITH FOREIGN TRADE SEEK VETERANS

THE rehabilitation of many returned soldiers in the Canadian forces has started with a struggle with the English language. The vocational training department of the Military Hospitals Commission, to whom the Government has entrusted the business of making verterans fit again for civil life, has scores of men enrolled in English classes in the military convalescent hospitals.

French, Swedes, Italians, and Norwegians who enlisted in the army of their adopted country when the war broke out are returning unfit for further military service, and the Government is giving them every opportunity to become equipped for success in the future.

#### English the First Necessity

It is commonly known that many foreigners who migrate to Canada are condemned to common labor by their lack of a knowledge of the language. Abilities which would enable them to become very useful factors in business are lost to them because of their handicap, and they are eager to embrace the opportunity which is being afforded them during their days of convalescence.

In the west where foreigners are to be found in large numbers, men who have learned English will find places in the business world easily. The appreciation of the work which the commission is doing in this line was evidenced recently in Saskatoon when a very perturbed manager of a big firm phoned to the hospital to see if they had a man who could translate some Norwegian mail for him.

The school was ready with the man.

### U. S. AUTHORITIES URGE CO-OPERATION BETWEEN WOOD SHIPBUILDERS

THE possibilities of increasing output from shipyards engaged in construction for the Emergency Fleet Corporation have been subject to investigation recently, with the result that efforts are being made to secure closer co-operation amongst builders along the lines of methods of construction, plant and storage equipment, etc.

According to a recent statement by Mr. James O. Heyworth, manager of the division of wood ship construction, some yards can work 300 to 400 men per ship at the time when the peak of construction of the ship is ready for them; other yards can work rarely more than 160 to 200 men per ship; even some of the old shipbuilders believe 100 to 125 men per ship is the limit for good construction.

#### Can Rely on Drawings

It must be remembered that in the Ferris standard type the plans are so accurate that much of the woodwork can be done with safety by sawing to the exact dimensions. For your information there are yards where the old shipbuilder was doubtful whether he dared saw to the exact size, leaving from 1 to 3 inches that could be hand reduced after the timber was in place, taking this precaution to be sure that the alignment of the ship would come out right. Experience shows that the plans and drawings can be relied upon.

We have records of yards where they have put as high as 500 men on a ship to advantage. In one yard this has recently caught up previous delay by over two months. We have numerous yards where 300 to 400 men are worked to advantage on one ship. Other shipbuilders that I have personally talked to were fearful of

The shipbuilders in each district should [illegible] association and meet at least once in every two weeks; remember that a week from now is equal to one month in ordinary times. The district supervisor should meet with this association; the meeting should be formal and carried on in a business-like manner, straight to the point, viz.: To illustrate by photographs and drawings, or papers, or brief talks, the advantages certain yards are obtaining by their methods and equipment and general handling of construction. The minutes of these meetings should be immediately put in proper form and distributed among the shipbuilders of the district, as well as a copy to the home office.

### Must Speed Up Production

This is no time to work on the old basis for wood construction. The country needs ships more than anything else. We must have them. Production must be speeded up.

It is logical that a general comparison can be made where so many yards are at work, and it is also logical that many of the yards are being operated along better lines of production than other yards. It is your duty and obligation to the soldiers abroad to take the utmost advantage of this fact and act accordingly.

The district [illegible] engineers, [illegible] for the purpose of arriving at how the yards are doing at best. Co-operation with these engineers will help, but real co-operation between the shipbuilders of each district, worked out in a proper manner, can double our production in the next six months.

## URGE DEVELOPMENT OF HOME FUELS

FOR the purpose of studying Canada's fuel situation from every angle, an important body of civil engineers drawn from all parts of the Dominion met in session in the Physics Building of the University of Toronto, on March 26 and 27. The Canadian Society of Civil Engineers devoted two days of the convention to an exchange of views upon means of making Canada independent of the United States in regard to fuel. The first day's programme took account of the necessity for extra immediate production and systematic conservation of coal in order to tide the country over the next year or two of war scarcity, but it covered more particularly the problem in its larger sense. Full emphasis was placed in the various addresses upon the imperative need of developing Canada's fuel resources so that in the future when the supply in the United States falls short, the industrial life of the Dominion will not suffer. Increased production of bituminous coal in the Western and Maritime provinces and of peat fuel in Ontario, together with radical economies in the use of coal, were proposed.

## MARKET FOR ASBESTOS MANUFACTURES IN ENGLAND

J. E. RAY, Canadian Trade Commissioner at Birmingham, England, has the following to say in regard to the market for asbestos products in that district: At the present time there is a brisk demand for manufactures of asbestos in the Birmingham district, but according to replies to specifications recently cabled by this office to Canada, the obstacle to the transaction of business is dearth of shipping space. However, if it is impossible to ship under the circumstances, efforts should be made to ascertain the requirements of the British market in preparation for after-war trade. As is well known, the production of raw asbestos in Canada has increased rapidly during recent years, but manufactures of the same have made but tardy progress. Some twelve months ago a range of German samples of manufactured asbestos was forwarded to the Department of Trade and Commerce. An excellent trade in these commodities was transacted by Germany with the United Kingdom prior to 1914. Firms interested can be introduced to importers in Birmingham, with whom preliminaries might be discussed in preparation for future trade.

## DEVELOPMENT OF AIRPLANE GUN AMMUNITION

CONDITIONS under which airplane fighting has been developed show that a continuous process of evolution has taken place conjointly between protective and destructive equipment. As the war progressed, the more vital parts of the airplane were protected with light armour, so that it became necessary to introduce armour-piercing bullets similarly.

As the gasoline tanks were particularly susceptible to incendiary explosion, it was necessary to procure a bullet containing an inflammable substance, ignited upon discharge, which would carry the spark or flame into the tank upon piercing it.

### Tracer Bullet Introduced

As the target, the enemy airplane, was within fighting range for only brief moments at a time, and as there were no means of determining the fire effect as on land, a tracer bullet containing a bright-burning composition, which would indicate the path of the bullet in daylight as well as in darkness, and thereby allow the aim of the machine gun to be corrected, was introduced. The composition is set on fire upon discharge and the bullet flies through the air as a bright spark plainly visible to the machine-gun operator.

All of these cartridges are of the small rifle calibers—caliber .30 or thereabout. The 3/10 of an inch diameter and short length of this bullet left little space therein for the armor-piercing element or for the tracer or incendiary composition. Nevertheless, combinations of armor piercing and tracer and armor piercing and incendiary bullets have been made.

### Meet Tests Fully

At the outbreak of the war, further information was promptly gathered from the allies and this subject was studied by those responsible for this work in the United States. Of course, on account of the difficulties of the problem, none of the special bullets possessed by any country is entirely satisfactory or what might be termed "perfect" in operation.

The bullets developed by the United States Ordnance Department have been tested on land and from airplanes to see if there is any difference in their performance when fired from a quickly moving airplane in the upper atmosphere and when fired on land.

These tests indicate that the United States has developed a class of special cartridges with a performance fully equal to that attained abroad.

## RESEARCHES ON TIN AND TUNGSTEN

THE *Board of Trade Journal*, London, England, says that one of the most attractive fields for investigation being opened by the exigencies of the war is that which pertains to the winning of tin and tungsten. Recently some successful experiments have been made with a view to increasing the recovery of tin. No systematic researches, however, have been undertaken beyond those designed to improve the appliances now in use; and, having regard to this fact, the Privy Council Committee for Scientific and Industrial Research has expressed the hope that a research association might be established in order that the series of investigations already undertaken might be continued with fresh vigor on a larger scale.

One of the difficulties in the way hitherto has been the want of adequate funds for sustained investigation and experimental trials. But the Ministry of Munitions, represented by the department for the development of mineral resources, is now venturing on a strong effort to make progress possible, and is suggesting that those interested in the tin and tungsten mines of Cornwall and Devon should co-operate in the establishment of a research association, and contribute to a central fund devoted to a study of the many-sided aspects of the problem. In this way adequate means might be provided annually for two or three years; and with such a fund, supplemented if necessary by a grant from the Committee of the Privy Council, experimental researches upon scientific principles could be conducted.

## NEW ZEALAND IMPORTS OF METAL MANUFACTURERS

PERTINENT remarks regarding business conditions and methods feature the report on 1916 trade of the Dominion of New Zealand submitted by R. W. Daltan, British Trade Commissioner. The losses sustained by British manufacturers, the reasons for such and means to be employed for recovery are of particular value to present and prospective exporters in this country.

The following table shows the total imports in this class, together with the shares of the countries named:—

| | Competitive. | |
|---|---|---|
| Countries. | 1915. | 1916. |
| United Kingdom | £1,8[illegible] | £1,799,901 |
| Australia | 63,065 | 97,434 |
| Canada | 111,953 | 165,042 |
| United States | 44[illegible] | 486,134 |
| Japan | 891 | 11,970 |
| Germany | 5,42[illegible] | 28,803 |
| Other countries | 4,1[illegible] | |
| Totals | £[illegible] | £2,589,784 |

There were no non-competitive imports during these years.

The following table shows the proportion of the total of the imports from each of the countries named in each of the two years:

| | 1915 | 1916 |
|---|---|---|
| Countries | % | % |
| United Kingdom | 76.7 | 69.5 |
| Australia | 2.6 | 3.7 |
| Canada | 4.6 | 6.4 |
| United States | 14.3 | 18.8 |
| Japan | 0.0 | 0.5 |
| Germany | 0.2[illegible] | 1.1 |
| Other countries | 1.6[illegible] | |
| Totals | 100.0 | 100.0 |

As was only to be anticipated, British manufacturers have lost ground in the trades covered by this class. A good deal of this loss is due to dealers having to purchase the products of other countries against their will, but there are a few lines in which the goods which have been supplied are capable of holding their own on their merits even in normal times. It will, therefore, require the display of energy and adaptability if our manufacturers are not to lose, permanently, trade in this market which they formerly held.

### Bolts and Nuts and Wire Goods

In bolts and nuts, the imports from the United Kingdom decreased from 27,391 cwts. to 24,282 cwts., while the imports from the United States increased from 1,761 cwts. to 3,831 cwts. American bolts and nuts are very much cheaper than British, but, allowing for difference in price, the British article is recognized to be a much superior article which would usually be preferred.

Imports of brass plate and sheet from the United Kingdom showed a large increase, while imports from the United States declined. Germany's share of the trade in metallic capsules has passed to the United Kingdom. In fencing staples, American trade increased, and there was also a considerable increase in imports from Canada. Dealers complain that the reason why this trade is largely in the hands of American firms is that British firms refuse to make the pattern which the market requires; but Canada has now begun to make this pattern, and is getting a good share of the trade. There were no imports of barbed fencing wire from the United Kingdom in the last year, and America supplied about 80 per cent of the trade. In ordinary fencing wire, the United States supplied the greater part of the trade, but the imports from Canada increased.

The whole of the fencing position in New Zealand demands consideration from firms in the United Kingdom. There are very few hedges such as are known in the United Kingdom, the common method of fencing being by wire. The American firms cater for the cheaper trade. There is no comparison, of course, in the qualities of the wire supplied from the two countries, and where first cost is to be considered only in relation to durability the British wire will always be used. But where land is continually being brought in and quickly changing hands, the cheaper method of fencing will often be employed, because first cost is often the main consideration. There is, consequently, a certain demand for the cheaper wire which our firms do not apaprently attempt to cater for. With the development of the dairying industry and the tendency to closer settlement, apart from the continual breaking of new land, the demand for fencing materials of all kinds is bound to be very great, and it would be worth the while of United Kingdom firms to study the position.

### Hardware and Hollow-ware

In hardware, hollow-ware and ironmongery, not otherwise enumerated, there were considerable increases in the imports from Canada, Australia, Sweden, Japan, and the United States. Probably the most notable line in which developments have taken place is enamelware. The difficulty in obtaining supplies from the United Kingdom has enabled other countries to develop this trade. The enamelware which has come from Japan has been of very poor quality, and much below sample on which orders were taken. Dealers generally are very much dissatisfied, and unless a great alteration takes place it is not likely that this trade will continue. The Canadian, American, and Swedish lines have been very satisfactory, though prices in many cases are high, but latterly supplies from Sweden have stopped.

The greater part of the growth in imports from the United States is probably due to increased trade from that country in files, screws, etc. America has been supplying good selling lines in pliers, such as formerly came from Germany, and has also entered the trade in sheep's ear markers, a line in which it is impossible to get satisfactory deliveries from the United Kingdom.

I consider that the United Kingdom trade in general hardware lines is not is not what it ought to be. The manufacturers are too much inclined to satisfy themselves with making a good article and leaving the article to sell itself.

The Americans may have an inferior article, but they make it look like a good one, and they consider the best way of making it appeal to the buyer. The average buyer has little idea of intrinsic value, and from my experience of New Zealand I am sure that, with the exception of certain recognized brands, the buyer will very frequently buy an American, rather than a British article, so far as hardware is concerned, for no reason than that it looks better value. In addition, the dealer finds himself almost obliged to push the American article to the disadvantage of the British if he is to make a good show in his store, and to make a good profit in his business. The articles which he receives from America look attractive on his shelves or in his window, while he is also supplied with plenty of showcards and advertising matter. Everybody who thinks knows, of course, that the buyers pay for all this, but few actually think of it.

If the manufacturer will consider that everybody believes that the British article is the best, but that it is the American article to which the attention of the customer is more often drawn, he will begin to find out what is the root trouble in our overseas hardware business. I am driven to the conclusion, after careful consideration, that many of the firms in the United Kingdom in this trade have not sufficiently realized what must be done to secure successful "selling," and that it is this shortcoming in their selling organization, almost solely, which is building up foreign trade in these lines.

It will probably be said that the figures of trade prove that the position of the United Kingdom trade is satisfactory and that, therefore, the methods must be. As a matter of fact they do no such thing in this trade at any rate, for the returns merely show that, in spite of defects, the quality of the goods which United Kingdom firms have to offer is the saving factor. More trade could be done here if their methods were improved. I could not rightly refrain from calling attention to this matter in the interests of British trade, as the weakness is so obvious to any one who travels through the country, and one cannot go into any hardware store without finding proof of it.

### Galvanized and Corrugated Sheet

Imports of galvanized and corrugated sheet, for which the demand is very great, showed a large decrease. Prices have risen to an extraordinary extent, and it is extremely difficult to find even small lots on the market at present. Imports from the United States increased from 8,072 cwts. to 10,579 cwts., but it would seem almost certain that when supplies are again available the trade will revert to the United Kingdom.

### Wrought Iron Tube

Canada has done a very large business since the war in wrought iron tube 6 inches and under in internal diameter. In 1915 very large quantities of this tube were placed on the market at low

[illegible] by the agent of a Toronto firm, and, in fact, for a time, dealers were [illegible] The imports from Canada in 1916 were only about half of those in [illegible] and the imports from the United Kingdom also fell considerably. I am informed that the Canadian lube is good value and will probably hold its own after the war.

### Lighting Equipment

The German trade in oil lamps has apparently passed into American hands, the trade from the United Kingdom having gradually declined since the war, while that of the United States has shown a considerable increase. There seems to be no reason why United Kingdom firms should not secure more of this trade, which includes both inside lamps and hand lanterns. It is absolutely essential, however, to keep to the patterns which the market calls for and this United Kingdom firms do not appear to do. The imports of gas mantles from the United Kingdom showed a large increase. The United States supplied 1,685 electricity meters as compared with 191 in 1915.

### Nails and Tacks

There has been a considerable increase in the imports of small nails and tacks from the United States. The American tack would seem to have a better finish than that from the United Kingdom, and it is packed in small cartons for retail trade, a fact which is said to help sales. These packets can be retailed at 1d. and are neatly packed three dozen in a box which can be shown on the counter. In wire nails, Canada is taking the place formerly held by the United States. This trade is apparently purely a question of price; with the assistance of the preferential tariff, Canadian firms can underquote American, while British prices are as a rule too high.

The United States supplies the majority of the spraying pumps which are imported, but there is a locally manufactured article which is selling well. This, of course, refers to pumps which are known as bucket pumps and knapsack pumps for handwork. The large pump, petrol driven, which is used in the large orchards in the commercial fruit-growing districts, is an American article. It is horse-drawn, and with a motor of 1½ horse-power with 600 revolutions per minute, costs about £120. British manufacturers do not apparently cater for the trade in the motor-driven pump, though they do supply some of the hand pumps.

### Stoves and Ranges

The trade in oil stoves is largely in the hands of American and Swedish firms. The American stove is sold by the oil companies as a means of cultivating a demand for their oils. The prices, which are fixed by the oil companies, are very low. Imports of gas stoves, which are solely from the United Kingdom, showed a marked increase. The trade in other stoves and ranges also increased, but the majority of these are now supplied by local manufacturers.

### Tinsmiths' Furniture and Fittings

Tinplates have been very difficult to secure, and the imports from the United States have increased in consequence. In tinsmiths' furniture and fittings there has been a large increase in imports from Australia—the majority of these imports probably consisted of fittings for articles used in dairy factories.

### Axes and Saws

The remarks which have been made above in reference to general hardware lines apply to some extent to the trade in tools, but in this trade there is an added difficulty in that the tools which are obtained from the United Kingdom are not always suitable to conditions in the country. This refers chiefly to such articles as axes and saws. In the former the United Kingdom trade is practically non-existent, one or two firms have made an attempt to meet the bushmen's requirements, but for some reason they have not been very successful. United Kingdom firms interested in these have had their attention drawn to the position in regard to these articles, and I do not propose to consider the matter further than to say that New Zealand is still without a British axe of an entirely satisfactory character. As regards saws, I believe that saws to compete with the American special saws are now to be had in the United Kingdom, but they have apparently not been offered with any energy in the Dominion. In spades and shovels, the British article has displaced the American, but I understand that an American long-handled shovel made to a well-known British design is now being offered on the market at $7.50 per dozen, f.o.b. American port, which is lower than the corresponding British price.

So far as other articles in this class are concerned there is little of interest to record. The market is very well stocked, if not overstocked, with goods, and it is practically certain that imports in the present year will show a falling off. Building is practically at a standstill and public works are being reduced to a minimum. In addition, the working of the Military Service Act is resulting in the stoppage of any work on farms or elsewhere that is not absolutely essential. Wholesalers are, consequently, anticipating quiet trade and are indisposed to place orders. This, of course, relates to goods which can be bought; there is a great scarcity of some goods of the heavier classes, of which delivery cannot be secured under present conditions of trade.

## FOREIGN TRADE OF CANADA

(Comparison 1915, 1916, 1917)

### IMPORTATIONS

# Role of Chrome Vanadium: Its Position Among Alloy Steels *

By F. J. Griffiths**

*Simple heat treatment, wide range of permissible temperatures and the possibility of producing almost any desired physical properties to suit different classes of application have caused chrome-vanadium steel to be the object of much investigation and research. The writer discusses the properties, processes and applications of this steel.*

CHROME-VANADIUM steel holds the position virtually at the head of the commercial alloy steels and owes this prestige to the extremely wide range of physical qualities which are capable of being developed from this metal by proper methods of heat treatment. Like all alloy steels it is, as its earlier name signifies, a special steel, meaning not only that it is designed for special purposes, but also, that its preparation for the particular work it is called upon to perform must be carried out along certain lines calculated to yield in the final result, those qualities which shall represent 100 per cent. efficiency in the final product. Many specifications to-day allow a variation of 1 or 2 per cent. in the elongation, and restrict also the ultimate strength and yield point to extremely narrow limits. Examination of these specifications alone would serve to show the wide range of qualities of [illegible] delicate accuracy with which by proper management it may be put into condition to perform its highest functions.

### Its Composition and Structure

Chrome vanadium combines in such a manner with iron that the separate constituents of the final alloy produced cannot be distinguished, regardless of the methods selected to separate them. Whether we adopt mechanical means or use the microscope under large magnification the result is the same. This phenomenon indicates a quite strong combination between the alloying elements and defines the combination unmistakably.

Until recently little investigation has been ventured to ascertain the definite properties of chrome vanadium, and the [illegible] imparted by this [illegible] element were relatively unknown except to a favorite few who, through their own research work, acquired intimate knowledge of the characteristics bestowed upon iron by the addition of this alloy.

Chrome vanadium alloys with iron in all proportions and affects the properties to a marked degree, depending upon the percentage of chrome vanadium present. The qualities which become inherent are influenced also more or less proportionately by the amount of carbon contained. In this respect chrome-vanadium steel is a special steel in another sense of the word and cannot be judged by the same standard as the old carbon steels.

The point of view of the examiner of the old commercial steel is always that of the actual condition in which the metal exists as he sees it before him, and governed by the amount of carbon present. But this point of view has altered grad[illegible] the carbon range permissible to obtain specific characteristics has become narrowed. The presence of chrome vanadium in steel intensifies the effect of the carbon in all the best qualities, which it is capable of producing alone.

The property of soundness of the casting and ingots produced by the use of chrome vanadium induces freedom from occluded gases and greatly increases the desirable physical qualities of the forgings subsequently made from this steel, such as strength, ductility and resilience. These desirable properties are amply proved not only from the results obtained from tests, but also from the more vital trial of actual use.

### Value of Special Steels

According to the old view and judging from the results of tests chrome vanadium steel, as rolled or annealed [illegible] appear to be a worthless product. It may have, as in examples to be given later, a percentage of elongation, reduction of area, elastic limit, and ultimate [illegible] corresponding to simple carbon steel. Stress is laid on this particularly, because there is still a large and unreasonable prejudice in certain quarters against the use of steels which have to be put in special condition, or more plainly, heat treated, before they are capable of doing their best work. Of course, as we all know, this feeling is largely giving way before the splendid performance which steels of this character are giving in service, and given sufficient time the special steels themselves will demonstrate the unsoundness of this objection based largely upon the limitations of the older simple carbon steels.

In order to make this more definite the subjoined tests, which are in no sense exceptional, are offered. They have been selected almost at random from records for the purpose of illustration. They cover briefly four classes of chrome vanadium steel, as follows:

A steel with a composition of about 0.1 per cent of carbon, 0.95 per cent. of chromium and 0.14 per cent of vanadium.

A steel of 0.42 to 0.49 per cent. of carbon, approximately 1.10 per cent. of chromium, and [illegible] per cent. of vanadium.

High carbon chrome-vanadium steel of a composition of 0.98 per cent. of carbon and 1.06 per cent. of chromium and 0.12 per cent. of vanadium, and

Low-carbon chrome-vanadium steel of an analysis suitable for most strucutral purposes, namely, carbon, 0.24 per cent.; manganese, 0.69 per cent.; chrome, 1.10 per cent., and vanadium, 0.15 per cent. It is to be regretted that while we are engaged on extensive tests of the third class of material mentioned, our experimental data are not at present available for use here. However, the extreme softness and ductility of this steel in the annealed condition may be noted from the one example given. This result is rather surprising in view of the high-carbon content present. Table I gives results of tests on these steels.

An examination of these results, which are concerned only with the simplest quenching and drawing treatments, shows the versatility of chrome-vanadium steel. One comment, however, based upon a practical consideration and not upon theory, may well be made here. Test results such as these just presented are valuable only in so far as they are recognized for what they are. They represent, it is true, what it is possible to do with the metal when it is in the finished state, but they do not necessarily represent what the qualities of the metal in the final product will be, if the heat treatment is carried on under exactly the same conditions as those which obtain in the tests. When it comes to question of heat treatment of the final product, the conditions must of necessity be altered somewhat, and the treatment of each class of articles then becomes a special problem. This should not be considered in the light of admission on the part of the steel manufacturer; it should be rather conceded as the principle by which he is most willing to work.

One of the principal effects produced in steel by the addition of chrome vanadium, is to raise the temperature at which the carbides dissolve in the iron, and the temperature at which they are precipitated out of solution. This elevation of the solution temperature is quite noticeable, the carbon content affecting this temperature but slightly. When chrome is added to steel it raises the critical points on heating above the corresponding carbon-steel temperatures, but on cooling, the critical point is considerably depressed, roughly in proportion to the maximum temperature from which the steel is cooled. The higher the maximum temperature reached the lower the critical range will be on cooling. This fact serves to show the slowness with which the structural changes occur in this alloy and the additional time required for the transformation to be effected completely.

It is unnecessary to point out the practical utility in commercial practice of working with a steel, in which this slow rate of transformation can be taken advantage of by the use of higher temperatures without resulting injury to the product, and also by the fact that the steel can stand exposure at these higher temperatures without the attendant harmful effects characteristic of other steels subjected to the same conditions. In fact, chrome vanadium seems to attain its greatest combination of desirable qualities at higher treatment temperatures than would be expected from the location of its critical range, due principally to the greater length of time necessary to effect the [illegible]

*Abstract of paper read before American Society for Testing Materials.

**General Superintendent, Central Steel Co., Massillon, Ohio.

uniform and homogeneous solid solution. other commercial alloy steels, although excellent in many respects, have very narrow limits of annealing and hardening temperatures, and therefore require unusual care in their treatment, a slight deviation from the correct temperatures resulting unsatisfactorily.

found by experience that a temperature of 775 deg. C., which is suitable for hardening a case-hardening steel and still retain desirable toughness of the core, can also be employed for hardening oil-treated parts.

The lower-carbon chrome-vanadium steels are apparently pearlitic in nature and, as such, possess the increased strength and hardness resulting from the

A single quenching and drawing treatment, as we have seen from the tests, is sufficient for general purposes to effect complete refinement and hardening of chrome-vanadium steel. This characteristic of simplicity in treatment obviously insures a high-grade product under ordinary commercial conditions, and when compared with the double and triple heat treatments required for the refinement of other alloy steels, the economy presented is obvious. These properties, possessed only by the chrome-vanadium alloy, characterize this steel as a material universally applicable for any commercial requirement. They also simplify the treating instructions necessary to successfully handle alloy steel of this chemical composition. One heat-treating specification is adaptable for any carbon analysis, whether the steel is destined for case-hardening purposes or for oil-treating for gears and cones, etc. It has been

effect of the special elements, in producing a ferrite of superior strength, subsequently resulting in a more dense and improved pearlite. With the increase in the carbon and alloy contents, this steel becomes more or less cementitic, and it is probably this quality which demands the use of higher temperatures than usual in treatment in order to produce complete absorption of its component parts.

The quality of chrome-vanadium steel often described as "tough-hardness," is one of its especially desirable properties, and is due probably to the somewhat finer and denser structure of the microscopic constituents, and to their more uniform distribution. This effect is obtained not only through the actual influence of the chromium and vanadium as component parts of the alloy, but also to the influence of the combination of both of these elements in producing in the molten metal a condition of purity and freedom from gases, and, therefore, subsequently forming a metal which, at the time when the structural changes occur, is in the best possible condition for these changes to take place, that is, in the highest form in which the alloy composition renders it possible.

### Adaptability of Chrome-Vanadium Steel

From conclusive tests, chrome-vanadium steel can be described as a universal steel. With the carbon present in variable amounts, almost any physical property desired can be secured. It is adaptable for casehardening where the carbon should not exceed 0.20 per cent, that is, for axle shafts, etc., where nominal strength is essential; for oil-treated gears and vanadium springs, where great resilience and resistance to repeated shock is required; for dies, where surface hardness and toughness must both be present; for drills, etc., where wear-resisting qualities and lack of potential brittleness is necessary; for cones and raceways of bearings, which must possess a glass-hard surface, accompanied with proportionate toughness to prevent checking and cracking under the stresses imposed.

The adaptability of chrome-vanadium steel is general, and where strength and hardness and resistance to fatigue properties are the prerequisite, there is a chrome-vanadium steel for the purpose. When the steel is case-hardened, a glass-hard surface and tough fibrous core is easily obtained. These properties are obtained without complex treatment, consisting of simple quenching, with reheating and quenching. For other heat-treated parts, a simple heating, quenching and drawing give a steel, relatively so tough and strong that it is unlike any other hardening alloy steel. Chrome-vanadium steel is a universal alloy steel and stands forth unmistakably as the master alloy.

TABLE 2.—RESULTS OF TESTS ON CHROME-VANADIUM STEELS OF A LARGE AUTOMOBILE MAKER

| Specimen No. | Elastic Limit, lb. per sq. in. | Tensile Strength, lb. per sq. in. | Elongation in 2 in. Per Cent. | Reduction of Area Per Cent. | Brinell Hardness No. |
|---|---|---|---|---|---|
| | 162820 | 172850 | 14 | 49.7 | 418 |
| | 160130 | 172090 | 14 | 49.5 | 418 |
| | 160840 | 173090 | 15 | 49.9 | 387 |
| | 159720 | 171630 | 14.5 | 46.9 | 377 |
| | 154180 | 164760 | 14 | 52.4 | 364 |
| | 151000 | 162240 | 14 | 55.7 | 364 |
| | 154570 | 165160 | 15 | 52.3 | 364 |
| | 150920 | 162590 | 15 | 54.0 | 351 |
| | 146790 | 162790 | 15 | 55.6 | 340 |
| | 146700 | 158960 | 15 | 55.7 | 340 |
| | 146080 | 157790 | 15.5 | 55.3 | 321 |
| | 148620 | 158090 | 15.5 | 55.8 | 321 |

Table 2 gives results of tests made by a large automobile manufacturer using chrome-vanadium steel for principal parts. The tests given represent those made from 0.30 to 0.40 per cent. carbon chrome-vanadium steel used for axle shafts, and demonstrate results that are secured from routine practice. The uniform strength exhibited supplies incontestable testimony of the dependable qualities inherent in this analysis steel when treated in commercial quantites.

## ELECTRICAL PORCELAIN

THE problem of securing desirable electrical and mechanical properties in the manufacture of porcelain used in the electrical industries is one beset with many difficulties and, while the products of some companies stand very high tests and seem in every way ideal insulators, the products of some other companies are well-nigh worthless.

Those who know the cause for this variation in quality do not seem to be inclined to distribute the information, but in general a porcelain mass will be the more resistant, the higher the proportion of kaolin and felspar also the finer the grain of kaolin used the higher will be the maturing point of the porcelain produced.

### Composition

According to a paper by Arthur S. Watts appearing in the transactions of the American Ceramic Society the leading materials used in porcelain manufacturing are certain kinds of kaolin, which are very slightly plastic, quartz and felspar. Ordinary felspar displays basic properties in the fire, uniting with the silica to form silicates. Therefore the kaolin content must be in a definite ratio to the quartz and felspar for the production of desired insulating qualities.

Too much quartz makes the body too little plastic, thus making it difficult to work, and after burning the ware shows impressions and some warping due to the tendency of the clay substance to contract. Too high a content of felspar makes the body soft and liquid and increases the tendency to crack. A body low in felspar does not produce sufficient vitrification and hence decreases its insulating efficiency.

A porcelain body may shrink 15 to 18 per cent. and it is very important that the exact degree of shrinkage be known. No crazing or shivering is allowable in the glaze used on ware for electrical materials. If the glaze is too infusible the ware is likely to be dull, and if too fusible it is likely to be covered with blisters. Investigation has proven the condemnation of glazes containing metallic oxides to be unfair. Metallic oxides when used in glazes combine with silica forming silicates.

The plain bell used for low potentials and which is also practical and satisfactory for alternating currents up to 1,000 volts, does not meet the requirements of modern high voltage transmission lines. Up to tensions of 3,000 volts the ordinary double bell 75 mm. wide and 100 mm. high suffices, but above this voltage the question of further improvement arises.

At first insulators were glazed and burned, resting on the bottom edge of the bell, but the roughness of this edge seemed to cause the collection of drops of water and to prevent this, the insulator is now glazed all over, the glaze removed from the head and the insulator burned; the insulator is by this means made much more resistant and need not be so thick. The weight of porcelain used in the insulator is not of the greatest importance, but rather the quality of the porcelain and the kind of glaze.

### Manufacturing Methods

In Europe, insulators are made by all five of the clay working processes, viz., turning, pressing, jollying, casting and dry pressing. The writer stated that he was familiar with all these processes except casting, but was not prepared to pass judgment on the superiority of any given process of working, as of course the product and its shape and size would greatly influence the method chosen. Dr. Seger, in his work, shows very conclusively that a semi-dry process in which the material to be pressed contains the highest percentage of water permissible for good pressing, gives the densest and strongest bodies. The turning of large insulators is done similarly to all clay turning, the product being made mouth up and the top finished when the ware is sufficiently dry to permit of its being inverted. For making threads, threaded tube like steel tops, or automatic boring apparatus is used.

Pressing is done in moulds. Clay is placed in the mould in a lump and by means of a plunger its exterior is forced to assume the shape of the inside of the mould while the plunger shapes the interior.

Dry pressing produces more exact shapes than any other method. The moulds used are of steel and are very expensive. The body must be in such shape that it will not stick to the mould. To obtain it in this condition some factories use the following process.

The clay, after drying and being thoroughly pulverized, is placed in wet cement or plaster boxes and allowed to absorb 10 per cent. to 20 per cent. moisture. The mass is then sieved thoroughly. Ten kilograms of the body will contain about 1 to 2 litres of water. Of course this proportion must be maintained exactly in order to insure a uniform shrinkage.

The moulds are sometimes complicated and are often composed of insertions. Ware is threaded by means of a screw inserted in the bottom before the clay is introduced and which is screwed out rapidly by means of a crank. The tendency is to make insulators without threads as [illegible] trouble and loss in manufacture.

Porcelain which is not perfectly vitrified does not possess any great insulating efficiency even when perfectly dry.

### Essential Properties

Essential properties of an insulator are: That it possess first of all a high efficiency as a nonconductor, that it stand without snapping any reasonable strain put upon it and that it withstand blows of missiles, etc., without breaking. Electrical, abrasion and tensile tests are made to show these properties [illegible] tested.

From a study of the electrical resistance tests it has been found that every specimen standing a superior test has a high silica and moderately low alumina content.

In series showing the effect of alumina content no great difference is shown in ability of specimens to resist abrasion. Much the same statement would apply to series showing results of varying of silica, medium high silica specimens seem to chip worse than extremely high silica specimens, while the low silica specimens show a lack of ability to resist abrasion.

The conclusion reached is that a moderately high silica and alumina content will bring a good strong porcelain but that not over 1 per cent. alumina and 6 per cent. silica should be used.

Shrinkage tests showed that there are three factors that may cause a variation. (1) The amount of clay substance introduced; (2) the variation in the kind of flux used; (3) the amount of silica present. Hence shrinkage may be varied to suit almost any case.

In closing it may be said that an ideal porcelain for electrical purposes may mature at any point between [illegible] cone 12.

The bodies of high resistance porcelain in use in the United States employ potash almost exclusively as a flux, although some few may contain a small quantity of lime. The formation of small cavities in the porcelain weakens it remarkably in resisting strains. Porcelain must be thoroughly vitrified so that moisture cannot penetrate it.

## REVERSING GEARS FOR TURBINES

ENGINEERS are aware of the great disadvantage that the steam turbine labors under in view of the fact that it cannot be reversed. It must not be assumed that the production of a reversible turbine is from the nature of the case impossible, for the introduction of gearing in connection with marine turbines not only suggests a means whereby a single turbine may be utilized for driving the vessel either ahead or astern, it suggests also the possibility of designing a turbine capable of developing a large power, and capable of being driven in either direction. At present, however, the reduction gear sems to point to the simplest method of attaining the end in view, and already we have heard of reversible reduction gears wherein a small pinion wheel, which runs idle when the vessel is being driven ahead, is lifted into mesh between the pinion wheel on the turbine shaft and the gear wheel on the propellor shaft, with the result that the latter runs in the opposite direction. Whilst the controlling mechanism for such a device will have to be capable of exerting large forces, especially with units of large power, and while other mechanical difficulties readily present themselves, it certainly would appear as if in the development of this idea we may eventually solve the problem of the reversing of the propellor when the vessel is turbine-driven until such time as the reversible turbine is itself forthcoming.

## GRIPPING AND DRIVING METHODS FOR LATHE WORK. V.

By F. Scriber

WHENEVER a long part which is to be [illegible] it is a good plan to use the tailstock center of the lathe for supporting the work, thereby decreasing the liability of the part being thrown out of alignment under the stress of the cut.

An example where this has been done is shown by Fig. 34; here the end that is to be machined has an arbor driven into it, this arbor is placed in the tailstock center in the manner shown. The arbor is indicated at A. The groove is to be machined, end faced and the flange is to be turned, these being indicated at B. The work in this instance is driven by the spindle nose fixture in which the work is supported. In handling lathe work on a face plate there is considerable tendency for it to sag or where the work is not running in balance there is apt to be quite a little pound on the spindle. In order to support the face plate under these conditions a fixture [illegible] shown in Fig. 35 may

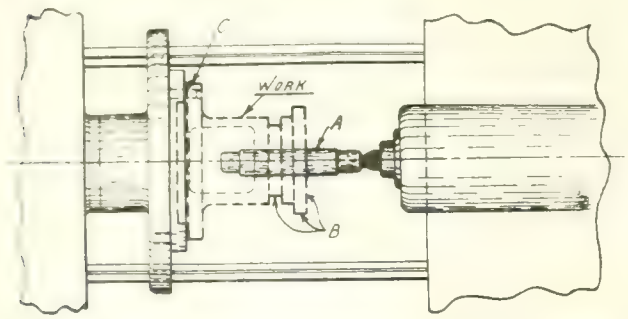

FIG. 34. SUPPORTING WORK ON FACE PLATE WITH ARBOR

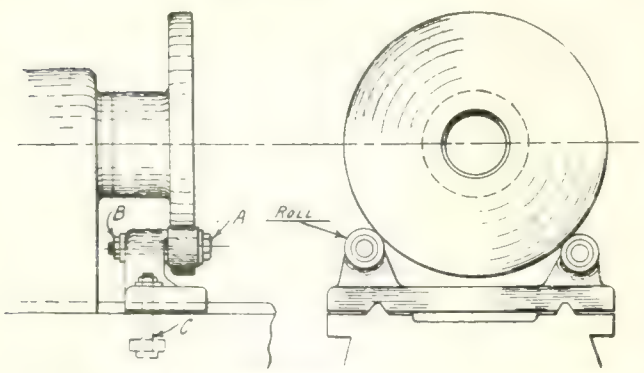

FIG. 35. ROLLS ON ECCENTRIC STUDS FOR SUPPORTING FACE PLATE.

be used; this consists of two rolls in contact with the outer surfaces of the face plate. These rolls are mounted on studs A, which are eccentric, by means of this eccentricity the studs may be turned thereby bringing the rolls into firm contact with the face plate, this feature may also be used to take up the wear on the rolls or the face plate. When properly adjusted the studs are clamped in position by means of the nut and washer B. The studs are mounted in a cast iron bracket which is in turn held to the ways of the lathe by the bolt and strap C in the usual manner.

In one of the illustrations shown in a former section of this article a method was shown for piloting a boring bar, the pilot bushing in that instance being held in the spindle nose. As it is not always practicable to use this method, Fig. 36 illustrates an example of a pilot bushing mounted in a bracket A, where the reamer or boring bar passes through the piloting bushing before entering the work, this method being similar to most jig reaming and boring practice.

### Safety Guard

When a chuck or spindle nose fixture is revolving there is always some danger of the operator being caught by revolving set screws or jaws, and to somewhat annul this danger guards similar to that shown in Fig. 37 are frequently used. The one to the left of illustration shows a sheet metal guard mounted on a chuck; this presents a smooth revolving surface, while the guard to the right shows a sheet metal guard attached to the side of the lathe. This expands over the chuck. The manner of using this is obvious from the illustration and of course various modifications of these methods are in vogue, many of them being made to swing out of the way while the operator is putting the work in the lathe although there is no necessity for this in a good many instances.

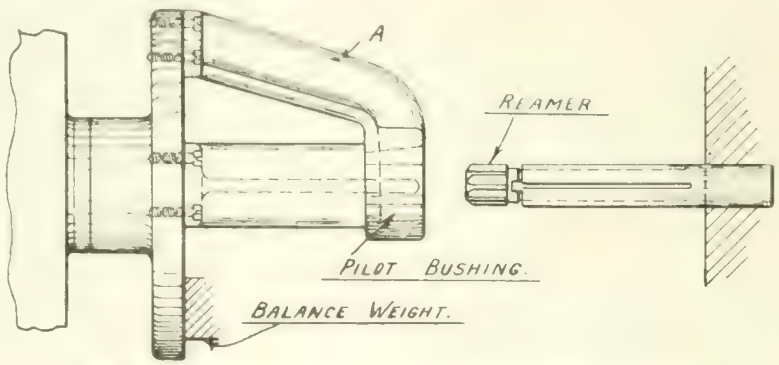

FIG. 36. FACE PLATE EQUIPPED WITH PILOTING BRACKET

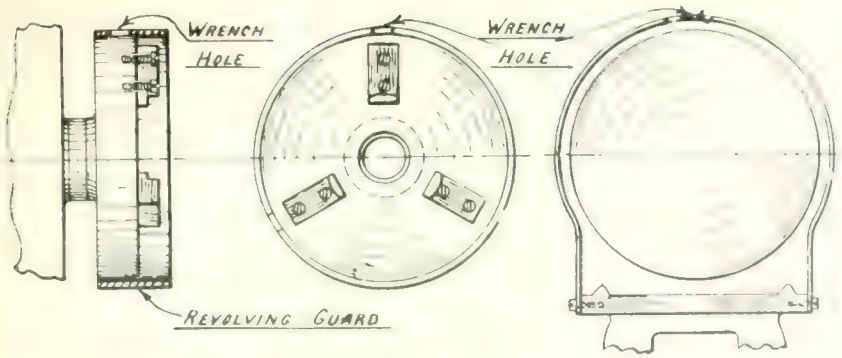
An example of gripping work in chuck jaws at one end while holding the work in a back rest at the other is shown by Fig. 38, the back rest used is the ordinary three-jawed rest furnished with the lathe and the manner of using is apparent from the illustration.

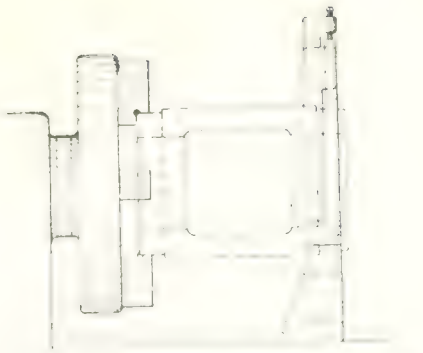
Fig. 39 illustrates a face plate which has an adjustable slide in it. The purpose of this feature is to provide some means of boring a hole eccentric with the outside of a piece, boring two or more holes which are in line or other similar operation, as after one hole has been bored the slide with the work mounted thereon may be moved over to the next hole. A vernier scale is sometimes provided with these face plates for convenience in setting the slide over.

### Arbors

A group of arbors for various purposes are shown in Figs. 40 and 41, these differing from the general run of arbors inasmuch as they are carried in the spindle nose. The first of these in the upper view of Fig. 40 is a plain tapered arbor. The work A is driven tight upon to force the work off the arbor. A pin wrench is used with this nut, while the arbor itself drives into the spindle nose and is driven by means of the key C. In the lower view of Fig. 40 an arbor carried in a spindle nose fixture is shown, the fixture D is made of cast iron and the work which has a tapered hole in it is carried on the stud E, the stud must be removed from the spindle nose fixture while the work is slipped through it, and by putting the stud back in place the work is securely clamped between the tapered part of the stud and the hardened ring F. The stud is tightened by means of the squared end G, and any tendency of the work to slip under the cut only makes the stud bind tighter as the thread is right-handed. The opera-



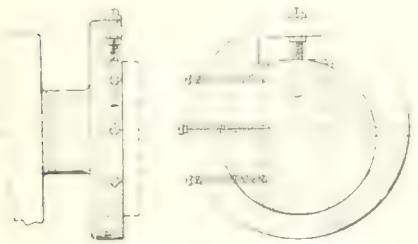
TWO CHUCK GUARDS



RIPPING IN CHUCK AND BACK REST

tions on this piece are turning the outside, squaring the end and cutting the recess in the face.

Referring to the upper view of Fig. 41 we have an arbor which is carried in the spindle nose in the same manner as the one described in the upper view of Fig.



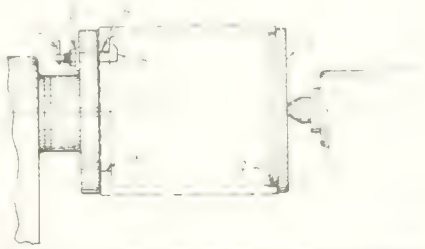
FACE PLATE WITH ADJUSTABLE SLIDE.

40. This arbor A is made to fit two diameters and the work is slipped on the surface B and C, while the driving of the work is obtained by tightening up the stud D; this stud is tapered inside at the end, and as the arbor has three splits cut in it the stud causes it to expand and grip the work.

The lower view of Fig. 41 shows a screw arbor and the arbor proper E has a pilot, this being the end F which is supported by means of a bushing in the tailstock of the lathe or chucking machine. A ring H is held to the flange of the spindle by means of four screws H, and on the spindle nose a sleeve J is mounted. This sleeve has a flange K, the object of this is that sleeve may be screwed back on the spindle nose until the flange comes in contact with the ring at L; in this position the work is screwed against the sleeve, thereby locating it in its proper position lengthwise on the arbor. By the machining of the part it is of course wedged on the arbor and to release it the sleeve J is turned by means of a spanner wrench in the holes M. This moves the sleeve out of contact with the work, after which the work can be readily screwed off the arbor.

When the work has been removed the sleeve is returned to the aforementioned position in contact at L. This makes it obvious that each piece will be located in the same position, which is an important item in securing duplicate work where threads are to be cut or cross-slide tools are to be used in connection with work mounted on an arbor.

three hook bolts B clamp the work. When putting the work on the fixture these hook bolts are turned out of the way by means of the pins C, and when the work is put in position the pin is also used to turn the bolt so the hooked surface will come in the correct position for



HOOK BOLT FEATURE LEAVES OUTSIDE DIAMETER CLEAR

clamping, tightening of the hook bolt is accomplished by the nut and washer D. In the end of the work nearest the tailstock a disc E is placed, thus permitting the tail-stock center to be used as a support. It is evident that the operation on this piece at this time consists of turning the outside, the inside surface at F and G having been machined in a previous operation and the ends have also been faced.

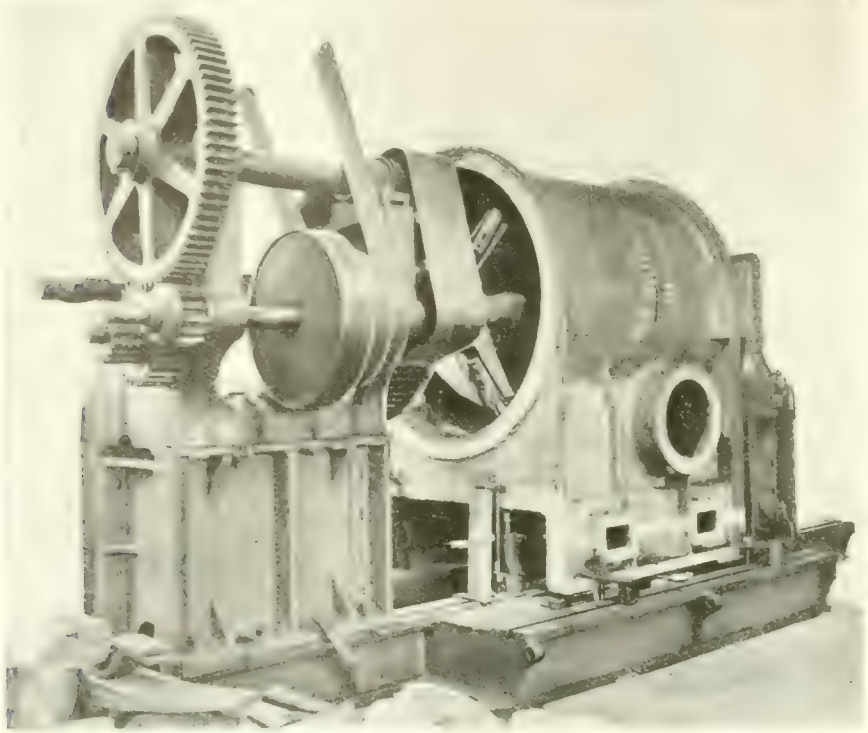
## CYLINDER BORING MACHINE

By A. E. Menzies.

THE [illegible] which have been tackled by the war are as varied in character as they are legion in number. Our machine shops are, perhaps, the largest gainers from the lecture halls of necessity.

The shop where the accompanying illustration was taken was for some time engaged in the manufacture of high explosive shells. As the work handled became that [illegible] repairs the



CYLINDER BORING MACHINE MADE FROM CAR WHEEL LATHE

staff had to commence at the grass roots. When the shell contracts were completed and the shipping shortage was realised the management decided to get back to their own line and accepted a contract to turn out tramp steamers. As they decided to build their own engines fresh problems were presented to the machine shop for solution.

### A New Lease of Life

The first set of cylinders were bored out on a bull lathe; out like every other tool in the shop, this machine had more work than it could handle. The subject of the illustration, a car wheel lathe, built long, long ago by Wm. Collier & Co., Ltd., of Salford, Manchester, had been lying by resting and was shortly to be sent to the foundry when the ma- [illegible] The photo is what he saw.

[illegible] bed cast iron packing blocks about 3 ft. high were made and the head and tail stocks packed up on them. The shaft, gear and pinion on top of the front head were added, the pinion meshing with the gear built into the face plate. An 8-in. boring bar secured to the [illegible] running in bearing placed where the tail stock spindle used to be carries the traveling boring head. The head is driven by a key and travelled by a screw driven by a star wheel. The head used for boring the 62-in. dia. cylinder shown in the illustration has three arms, each arm carrying a tool. Setting up the work is not a difficult job as the bed affords ample surface to block and wedge from. The bar, of course, is used to set up by.

Besides being used for boring cylinders this machine has successfully faced up the ends of a large cylindrical condenser shell. It also came in extremely handy for boring out the recess for the main bearings in the bedplates of engines which the firm is building.

## A CHART FOR FINDING THE LENGTH OF COILED PIPE, ETC.

By N. G. Near.

WITH the aid of the acompanying chart it is a simple matter to determine the length of a coil of rope, the length of a pipe so familiar to the plumber, the length of a coil of rope, the length of a coil of wire, or a coil of almost anything as a matter of fact. This chart, however, was made primarily for pipe. The size limits of this chart, it will be noted, range from 4 to 30 inches in diameter (column A) and from one to 60 turns (column C). This limits the charts to a bit over 400 feet.

To use the chart, measure the "average" diameter of the coils as indicated by the sketch on the chart itself. That is, measure from the "mid-point" of one side to the mid-point of the other side in inches. Then count the number of coils. Then connect the diameter (column A) with the number of turns (column C) and the intersection with column B immediately gives the total length in feet.

For example. What is the approximate length in feet where the diameter is 15 inches and the number of turns is 20?

Connect the 15 (column A) with the 20 (column C), as indicated by means of the dotted line drawn across the chart and the intersection with column B immediately shows the length of the coil of lead pipe or whatever else it might be as very close to 79 feet.

It is evident that it is much quicker to use this chart than to unroll the pipe and measure it, or even to compute it, knowing that to compute one must divide the diameter in inches by 12 and multiply by 3.1416 and then by the number of turns in arriving at the result. Besides, this method is just as accurate anyway because of the judgment that must be used in measuring the diameter.

This method is much quicker and eas-

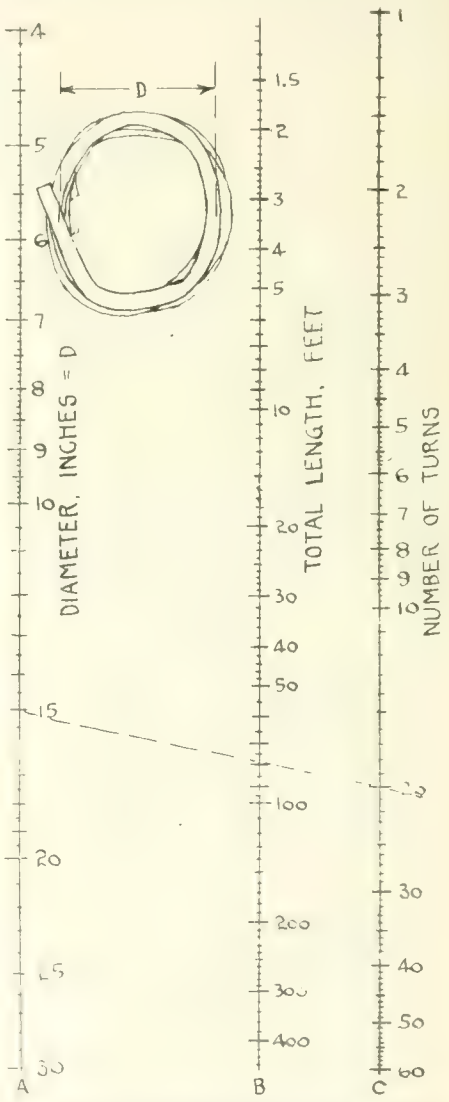


CHART FOR DETERMINING THE LENGTH OF COILED PIPE, ETC.

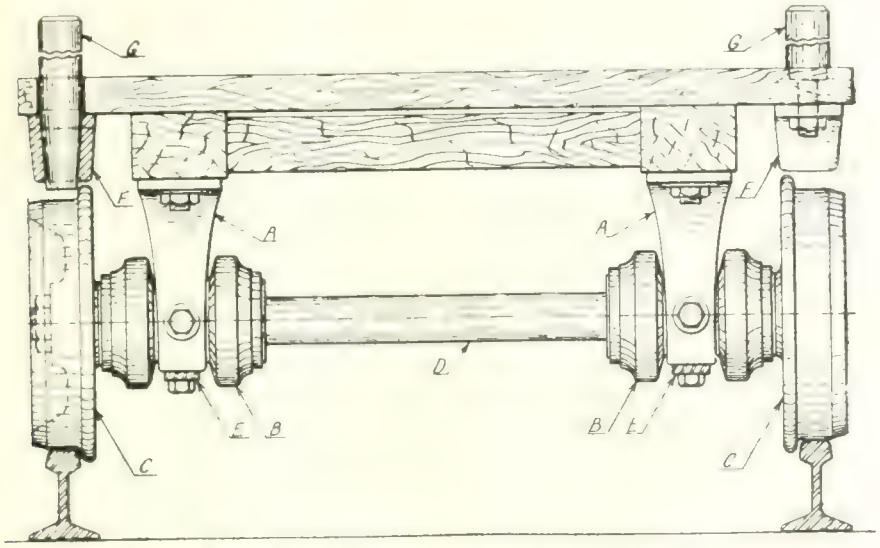
ier than to unroll a long coil and measure it with infinite care and then roll it up again. The method is not "absolutely accurate" but for most rough purposes it will do very well indeed. If it is desired to determine the "exact" length within an inch or even a foot (provided the coils are large) there is no surer method than unrolling and measuring in the longhand way. But if the answer is wanted only approximately, why do it the hard way?

## TRUCK WITH DISCARDED LINE-SHAFT BEARINGS

By J. H. R.

WHILE in a large shipyard recently the writer observed a factory truck of a very serviceable character, the shaft bearings for the truck axle being constructed from a number of line shaft double ball bearings that had become inefficient for their initial purpose owing to continual service. Their adaptation to truck service entailed a duty that in some respects exceeded that of the line shaft, but the factor of the high speed was eliminated, and consequently the partly worn bearings were given a new lease of life. The truck was used for transporting materials such as steel plates, bars and shapes to and from the various departments, and its construction offered minimum resistance to the propelling efforts of the workmen.



TRUCK MADE FROM DISCARDED LINE SHAFT BEARINGS

The frames are made of suitable planks and timbers and the bearing brackets A are bolted to the under side of the main side stringers. The bearings B are fitted into the slot in the bracket and locked in position by the bolts shown. The truck wheels are secured to the ends of the axle D; this particular truck being operated on the standard gauge track throughout the plant. Other trucks of a similar nature are provided with plain wheels for general purpose work on the concrete floors of the shop. To increase the rigidity of the supporting brackets, tie-bars E are secured to the lower portion of the bracket A and the ends extend at an angle of about 45 degrees to the main stringers of the top platform. Underneath the top planking of this platform several brackets F are placed to support the wooden pins G that are used to prevent the material from sliding off the truck.

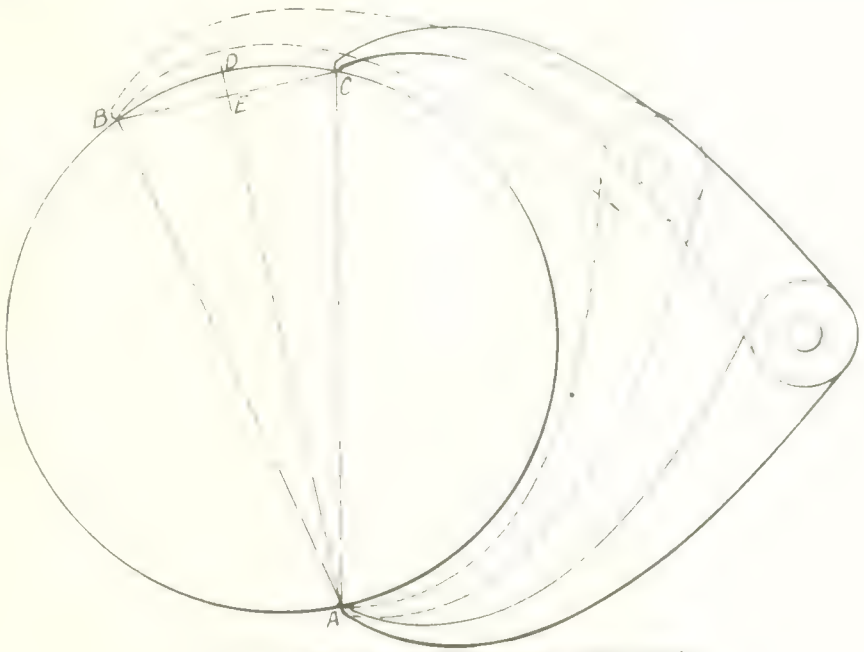
## SETTING LATHE TOOLS

By R. M.

JUDGMENT in the setting of lathe tools to remove a certain amount of stock is a trait that is only attained after considerable experience on the part of the operator. As a guide to the tool adjustment when turning work, the accompanying sketch may be of some assistance for young mechanics. Supose the finished diameter of a shaft is to be 15 inches and the calipers are set to this dimension. With one point of the calipers bearing at A, the other point is placed against the opposite side of the work at the points B and C respectively, as indicated by the full and dotted lines. Suppose that the chord, or the length B-C equals 6 inches and it is required to find the set-in of the cutting tool to remove the surplus stock. It is first necessary to calculate the distance A-D.

The length E-A can be found from the formula $E\text{-}A = \sqrt{(A\text{-}B)^2 - (B\text{-}E)^2} = \sqrt{15^2\ 3^2} = 14.7$ inches. The height of the chord D-E can be found by proportion, thus, D-E : E-C = E-C : E-A or $(E\text{-}C)^2 = D\text{-}E \cdot E\text{-}A$. Therefore $D\text{-}E = \frac{(E\text{-}C)^2}{E\text{-}A}$

$\frac{3 \cdot 3}{14.7} = .612$ inch. Then the complete diameter equals 14.7 + .612 = 15.312 inches, and the advance of the tool to remove the .312 inch of material would be .312 ÷ 2 = .156 inch.



ILLUSTRATING THE SETTING OF LATHE TOOL

## PICKLING SHIP STEEL

By D. D. Street

THE preparing or "pickling" of ship steel is becoming more common. Whatever compounds may be used for coating steel, it is very necessary that the mill scale should be thoroughly cleaned from the plates and the bars beforehand. The British Admiralty specify the removal of scale by immersing the steel in a bath of dilute hydrochloric acid, which contains one part of acid to nineteen of water. After remaining in some time the steel is taken out, hosed with fresh water and scrubbed with steel brooms. The material is then coated with linseed oil and allowed to stand in the weather for some days. In merchant work this has usually been considered an unnecessary expense, the usual practice being to put the material together without removing the mill scale and allow it to rust up. This rusting process is going on whilst the ship is on the stocks and until she is ready for painting. The rust and scale is then scraped off and the paint applied. The underwater portion of the ship is not painted before the launch, and the sea-water accelerates the rusting up with the result that when the vessel is placed in dry dock a very good surface can be obtained for the application of the anti-corrosive paint.

There are three principal methods of cleaning forgings, namely, pickling, tumbling and sand-blasting. The pickling is much better than sand-blasting. In the former method all surfaces are cleaned thoroughly from oxides or foreign substances which are detrimental to the machining operation, whilst in the tumbling and sand-blasting fine sand is hammered into the surface. This has a big effect in the machining operations.

the cost of machining being three or four times as great with a forging cleaned by [illegible] as it is a pickled forging. In addition, drop-forgings that have small holes or indentations are not properly cleaned except by pickling. It has been found out that the additional cost of pickling is more than effective and is offset by the saving in the cost of machining.

It is not uncommon to find nowadays merchant shipowners specifying that the steel used in their ships should be pickled. It is well-known that the rusting process is not absolutely effective, and the extra expense in the pickling is probably easily saved in the less amount of corrosion occurring and consequent smaller upkeep cost for renewal of steel. At the present time there is another strong argument in favor of pickling. Ships are rushed through very quickly, and if possible, dry docking near or on completion is dispensed with. This means that the bottom of the vessel has to be properly painted before leavin the stocks, and it is very doubtful if the rusting-up process has gone far enough to ensure a good application of paint. In such cases, therefore, it is better to be on the safe side and pickle the steel before erection.

## BRITISH SHIPBUILDING ACTIVITY

NEVER has there been greater activity in the shipbuilding yards of GGreat Britain than exists at present. On the four principal shipbuilding rivers of the British Isles every available foot of adjoining land has a ship more or less in construction on it. Nearby engine works are turning out motive power for the vessels at a tremendous rate. Shipbuilders of various sorts—men, women, boys, girls—are all working at top speed. Great Britain has two great objects in all this activity. The first is to help to beat the German U-boat destructiveness and the second is to recoup her greatly theatened prestige as the first maritime nation of the world.

Nowhere is the growing importance of the United States and Japan as maritime powers after the war so seriously taken as in the British Isles, and when the time comes for readjustment on the seas the latter is evidently intending to reassume their maritime precedence, and the British navy, which has been kept intact during the war, will enable authority to be given to these demands. It is well known in America that British builders are rushing out countless destroyers, cruisers and other naval ships, which must for the present remain as "mysteries." Standardization of construction has been adopted in the shipbuilding yards to the greatest possible extent. All parts of hulls, engines—in fact everything—are standard and may be used where first needed. Hitherto thirty-five sizes of steel sections were used in the construction of merchant vessels, but standardization process has reduced the number to eight. Before the war Germany was the only real competitor on the sea and now there are two friendly may be, but nevertheless competitors—Japan and the United States.

## ANNUAL CONVENTION OF FOUNDRYMEN'S SOCIETIES

MILWAUKEE, one of the leading foundry centers of the United States, has been selected as the 1918 meeting place for the annual conventions of the American Foundrymen's Association and the American Institute of Metals. Concurrent with these gatherings will be held the exhibition of foundry equipment and supplies, machine tools and accessories. On Monday, Oct. 7, the deliberations of the two foundrymen's technical societies will be opened with a joint session, and at the same time the visitors will be given their first opportunity to inspect the displays. The convention and the exhibition will continue throughout the week.

The meetings of the American Foundrymen's Association and the exhibition will be held in the Auditorium, where ample display space will be afforded and a sufficient number of large meeting rooms are available for the joint sessions which will be scheduled for three days of the week. This commodious building will be the center of all the foundrymen's activities, and here the headquarters will be established for both organizations.

The Auditorium is one of the largest and most complete structures of its kind in the world. Machinery hall, where the operating exhibits will be assembled, has a floor area of 54,000 square feet, and the arena, where the still exhibits will be located, has a floor space of 22,500 square feet. If necessary, the stage, 50 x 68 feet, also may be used for exhibition purposes. Two large meeting halls are located on the first and second floors respectively, and are separated by wide corridors from the exhibition areas, thereby insuring freedom from noise. Milwaukee also has ample hotel facilities to provide accommodations for the 3,000 to 3,500 visitors who attend these affairs.

Milwaukee is one of the largest foundry centers of the United States, and provision will be made for plant visitation in the week. Within the confines of the municipal limits of the city are located about 80 gray iron, steel, malleable iron and brass foundries, and including North and South Milwaukee and West Allis, the total is in excess of 90. Racine, Wis., only a short distance from Milwaukee, is the center of approximately 20 foundries. Milwaukee also is one of the leading steel casting districts of the world. It has approximately 20 steel foundries, a number of which recently have installed small open-hearth and electric furnaces. According to the 1914 statistics the value of iron, steel and heavy machinery of Milwaukee exceeded that of any other of its industries with a total of $34,300,585, and it is estimated that last year this totalled more than $50,000,000.

The committee of the American Foundrymen's Association empowered to decide upon the time and place of the 1918 convention and exhibition, which met in Milwaukee several days last week, consisted of the following: Benj. D. Fuller, president, Westinghouse Electric & Manufacturing Co., Cleveland; C. E. Hoyt, exhibition manager, Chicago; H. R. Atwater, Cleveland, Osborn Mfg. Co., Cleveland; S. T. Johnston, S. Obermayer Co., Chicago; V. E. Minich, Sand Mixing Machine Co., New York, and A. O. Backert, secretary-treasurer, Cleveland.

## FRENCH DISCOVER NEW LIGHT WEIGHT METAL

IT is said that the French government is manufacturing helmets from an alloy discovered by a Mr. De Montby, which contains from 92 to 97 per cent. of aluminum. It is suitable for use in the manufacture of air craft and military equipment. According to "Engineering," it is silver-white, has a specific gravity of 2.82, and a melting point of 1,382 deg. Fahr. Its tensile strength in castings is given as 30,000 lb. per square inch, and in rods and sheets up to 64,000 lbs.; heat treated, its tensile strength is given as over 70,000 lb. per square inch. It is claimed that it may be sand cast, die cast with or without pressure, hot and cold forged, annealed, drawn, rolled, stamped, hardened by temper, polished, electroplated, and soldered. It withstands the action of all acids except hydrochloric.

## B.C. GOVERNMENT TO INVESTIGATE IRON ORE DEPOSITS

AN intimation that the B.C. Government will probably amend the Mineral Survey and Development Act so as to enable the mines department to drill and test several iron ore properties without penalizing the owners with the double cost which the act provides, was given by Hon. William Sloan, Minister of Mines.

Hon. Mr. Sloan is to select the outside engineer to report on the project to establish a thermo-electric smelter and plate mill at Vancouver and expects to make his decision within a few days The minister stated that the B. C. Electric Railway Co. has joined with the Aetna Steel Co. and the provincial government in pledging the cost of the engineer's investigation on which the government will consider lending assistance to start a steel industry on Burrard Inlet.

"The government is alive to the great possibilities which a steel industry may bring to the province in settling a permanent steel shipbuilding industry on the coast and in developing the lighter manufacturing industries," stated Hon. Mr. Sloan, who added that as a further step in developing an iron and steel industry the government is contemplating an amendment of the Mineral Survey Act.

The first test of shrapnel was made in England 112 years ago, when a committee of British army men reported favorably on the invention of a fellow officer, Henry Shrapnel. Shrapnel was first employed in warfare in 1806 and fully demonstrated its explosive usefulness.

# Corrosion of Iron and Steel, and Its Prevention-II.*

By Abe Winters

*Perhaps the most patent feature of modern existence on this planet is the unceasing fight to contrast between the immense metallic plant and manufactures of mankind on the one hand, and the loss of finished metal due to corrosion. Sometimes almost more pressingly noticeable are the stoppages of vital services of all kind[illegible] which are likely to occur, while the latter is unpreventable certainty that [illegible]*

IT is generally recognized that the corrosion of a metal or alloy is intimately connected with the formation of local electrolytic couples at the surface in contact with the solution or the atmosphere. The process of corrosion is always initially one of chemical solution, the dependence of which on electrolytic conditions is well established. A highly purified specimen of zinc is almost inactive towards acids, whilst commercial zinc, containing lead, is rapidly attacked, the action of the liquid beginning in the immediate neighborhood of the lead particles. This is one of a large class of similar facts, the bearing of which on the question of corrosion is often overlooked.

### Physical Condition and its Effects

Laboratory tests of long duration or rapid tests involving the use on the one hand of active chemical corroding agents, or on the other of an applied electromotive force, are usually of an unsatisfactory character. A number of metals or alloys, arranged in order of their resistance to acid solutions, will present a very different order when exposed to technical conditions such as contact with city air or sea water.

The heterogeneity which gives rise to the formation of local couples may be of two kinds, chemical or physical. A pure metal is of necessity chemically homogeneous in the sense that it is made up of only one kind of atoms, but it may be physically heterogeneous. A metal which has been "cold worked" or deformed at a temperature below that at which complete recrystallization takes place, contains, as demonstrated by Dr. Beilby, films of amorphous material between the separate crystal grains.

The amorphous metal is more electropositive than the crystalline, as is shown by measuring the difference of potential between two specimens of the same metal in the cold-worked and annealed states respectively. Consequently cold-rolled metals almost always corrode in such a way that greater chemical action takes place along certain lines than along others, such lines following the direction of the rolling. This effect is not to be confused with the striation observed on the surface of rolled plates due to the inclusion of impurities.

### Effect of Cold Rolling

There are two reasons for the greater corrodibility of cold rolled than of annealed metals; the more electro-positive character of the former and their greater heterogeneity. Against this must be set the fact that some metals are commonly porous in the cast or annealed state, and that the closing of the surface pores by cold rolling may increase the resistance to corrosion, in some cases more than compensating in this way for the electrochemical difference. This applies mainly to atmospheric corrosion; in contact with liquids the electrochemical differences assert themselves more strongly.

Local cold-working greatly accelerates corrosion. The severely cold-worked condition which prevails around a punched hole is always the spot at which corrosion first appears if opportunity offers.

Besides the physical condition of the metal, that of the product of corrosion has to be taken into account. When iron rusts, the product is porous and bulky. It affords a ready passage to the corroding liquids or vapors, whilst at the same time, being strongly electro-negative to iron, the ferric oxide furnishes innumerable local couples which accelerate corrosion. On the other hand the layer of oxide formed on aluminum under normal conditions is extremely tough and coherent, and prevents further corrosion when a certain small thickness has been reached. Where corrosion is more rapid the coating may be porous.

In moist, tropical climates aluminum corrodes more rapidly, and the coating, although apparently continuous, may be minutely porous. Aluminum drinking vessels in hot climates acquire a foul taste, doubtless owing to the absorptive [illegible] oxide.

### Different Kinds of Corrosion

The term corrosion is used somewhat widely, but generally speaking may be taken to indicate the solution or oxidation of the pure metal or its constituents. There are three principal types, and these are not to be regarded as isolated or independant, rather are they extreme cases of an almost infinite variety of reactions, dependent upon the composition of the metal and the nature of the corroding influence. Type one, solution in acids, need not occupy our attention at this time.

Type two, graphitization. This is the form of corrosion to which cast iron is particularly liable, the mass becoming so soft as to be readily cut with a steel knife. The metallic portion is more or less completely oxidized, mainly to ferrous oxide, some of which has frequently been washed away, the remainder collecting within the pores of the now isolated mass of graphite.

Type three, formation of rust.—The most usual form of corrosion is that in which the iron is oxidized more or less completely to brown, hydrated ferric oxide, which remains *in situ* and is popularly known as rust. When relatively pure iron is suspended in tap water the ensuing rust consists almost entirely of hydrated ferric oxide, and there is usually no pitting. If on the other hand the metal is allowed to become alternately wet and dry, both ferric and ferrous oxides are produced, the proportion of the former varying enormously according to circumstances. In this case pitting is frequent.

When iron is only partially immersed in water the corrosion just at the surface of the latter is particularly severe, and the resulting mass of rust is usually high in ferrous oxide. Complete immersion of the iron in concentrated solutions of nitrates of the alkali metals may be made to yield a deep green oxide, while a dilute solution of oxalic acid develops a beautiful lemon-yellow form of rust. Dilute phosphate solutions may yield a white rust, whilst alkaline iodides can be made to yield black rust.

### Influence of Composition Upon the Corrosion of Steel

Rusting occurs in all known steels to some extent when submitted to test with an appropriate medium. Ordinary rusting is slightly retarded by the presence of 3 per cent. tungsten in the steel, while in salt water the corrosion is increased. Vanadium has practically no effect on the corrodibility of steel. Chromium decreases the tendency to rust with steels of varying carbon content.

Nickel decreases corrosion when at least 3 per cent. nickel is present except in rare cases where the percentage of carbon present evidently exerts an influence favoring corrosion. Manganese steels are very irregular in their behaviour, generally speaking manganese causes increased corrosion of steel when the latter is suspended in water.

Changing the crystalline structure of steel by annealing, hardening, and burning causes the amount of corrosion to vary. In electrolytic corrosion this amount of corrosion per ampere hour of the hardened steel is considerably less than that of annealed or burned steel.

Recent experiments indicate that electrolytic corrosion produced by the flow of a current of moderate density from an external source produces results on the metal which are similar to those produced by corrosion under ordinary conditions.

In many, if not all cases, the character and rapidity of ordinary corrosion of iron and steel depend upon their physical and chemical properties, and the galvanic action due to differences in potential between different parts of the metal.

*No. 1 appeared Feb. 28.

### The Effect of Strain

The application of stress to metals [illegible] chemical activity, this increase being especially marked after the elastic limit is reached. In cast iron and steel, in their many processes of manufacture, there are many irregular zones of density and purity, each of which has its own potential. Between all of these differently charged bodies a current of electricity is set up, the circuit being completed through the electrolyte.

This electric current flowing from the metal to the electrolyte will cause corrosion of the metal, which may be general over the surface of it, or be localized in spots, according to the composition of the metal, which is affected by local disturbances such as welds, strains, annealing, burning, and hardening, or the presence of foreign substances. Some peculiar cases of corrosion can be explained by ascertaining if the metal has been subjected to some of these influences, that otherwise would be classed as mysterious.

Hardened steel being necessarily under a highly strained condition should show greater corrodibility than annealed or burned steel. If it does not, it is owing to the fact that the high tension between the particles holds them in place until they are severely corroded away.

Metals which do not change their physical characteristics when strained apparently do not materially change in corrodibility as the result of strain, though the very softest iron does harden slightly when strained and its corrodibility is slightly affected by strain.

## NAPHTHALENE AS MOTOR FUEL

By L. E.

THE effect of the compulsory search for a substitute for petrol has been highly beneficial, as it has stimulated experiment and test in directions which would otherwise have been neglected under normal conditions, and research has revealed that coal provides an excellent hydrocarbon which can be utilized as fuel for the internal combustion engine: benzol. But this product is indispensable for war purposes, so it was promptly ruled out of court. Yet benzol is but one of the many hydro-carbons derived from coal, although it is admittedly the most acceptable substitute for petrol, as a fuel for the explosion motor. But coal possesses other constituents of a similar character, although somewhat heavier, and amongst these must be mentioned naphthalene, a substance which, while not popularly known under its technical name, is familiar enough.

Naphthalene is a crystal. In its crude condition it might also be compared to dirty, finely-powdered snow, being relatively light and fine in its consistency. In this condition it contains a certain proportion of creosote oil, which imparts an oleaginous character to the substance, but which can be driven out by subjecting the powder to a violent centrifugal or whizzing action, and can be further cleaned or rectified by washing with an acid. But naphthalene is the bugbear of the gas engineer, and of the householder, who depends upon coal gas for illumination. With a slight drop in temperature it condenses in the form of snow and becomes an obstruction in the pipe. A very small quantity suffices to impede the natural passage of the gas, and recourse to the force pump or a liquid solvent are the sole effective palliatives. Apart from its conversion into dyes and carbon blocks and moth balls, naphthalene is of little use except possibly for the preparation of firelighters, to which latter purpose about 50% of the total yield is devoted.

In pre-war days crude naphthalene commanded about $20 per ton, and although the current price is from $25 to $35, its reclamation cannot be described as profitable. The annual yield in the aggregate from the gas and tar works of the British Isles is equivalent to about 10,000,000 gallons. Yet naphthalene is closely allied to the more appreciated hydro-carbon, benzol, and it belongs to the same series. The chemical symbol for benzol is $C_6 H_6$, that for napthalene is $C_{10} H_8$, and this close relationship was responsible for the doping practice which had a certain vogue during the early days of benzol as a motor spirit. This fact was also responsible for another line of action amongst certain French and German investigators. They advocated the possibilities of the compound as a fuel for internal-combustion engines, and carried out experiments to support their assertions, but they never achieved distinct success. The general practice was the dissolving of the naphthalene in a lighter hydrocarbon such as petrol or benzol. These two liquid fuels will readily absorb a certain portion of napthalene, the quantity varying from 20 to 40 per cent. But the experiment did not prove successful in practice.

### Success in Sight

Other inventors, confident of their ability to use napthalene as a straight fuel, confined their efforts to achieving success in this direction, but other difficulties arose, and success was not forthcoming. But to-day it seems as though success is within a measurable distance of turning this elusive by-product of coal into a commercial motor fuel, and that without recourse to doping or other expedients.

Some five years ago two English experimenters, Mr. J. H. Willis, and Lieut. G. G. Wilson, attacked the problem. Their investigations elicited one important fact and they resolved to continue their researches from point where text books left off. These had settled that the melting point of the hydro-carbon was 79.8 degrees C., and the laboratory experiments were conducted on methodical lines from this point, and these proved conclusively that it was necessary to raise the temperature to about 133 deg. C., in order so highly to change a small volume of air into naphthalene vapour that sufficient would be present in a form suitable for an explosive mixture with a large proportion of air subsequently introduced. It was also found that the explosive mixture was formed when composed of 12 parts of air to 1 of naphthalene vapour.

A special form of vaporizer had to be devised and subsequently the vaporizer, carburetter and fuel tank were combined. With the experimental installation, starting up is conducted on petrol. After running for about ten minutes by which time the naphthalene has been melted and raised to 275 deg. F., the petrol is shut off and the napthalene vapour switched on.

The engine can be started on the naphthalene, which will retain its liquid form for an appreciable period. The results achieved are so striking that the fact is established that it is possible for an internal-combustion engine to be run exclusively on this new fuel.

## LOSS OF MAGNETIC QUALITIES AS A GUIDE IN THE HEAT TREATMENT OF STEEL

It is contended that to rely on pyrometrical observations in determining the all-important critical point in the heat treatment of steel is hazardous, because so many factors have to be considered in this method. First, unwarranted credence has to be placed on the permanent accuracy of the pyrometer, regardless of the natural deterioration of the thermo elements which are subjected to the temperature. Secondly, the element has to be borne in mind of the period of time necessary in order that the steel may assume its critical temperature. Thirdly, the personal factor then appears in determining whether the steel has assumed this temperature. It is a well-known fact that steel in the process of heating loses its magnetic properties when it is brought to its critical point. Taking advantage of this phenomenon, there has been invented an ingenious device which serves to indicate the critical point in the heat treatment of steel. Through the medium of magnetic coils contact is made with the steel in the furnace, while a magnetic indicator is placed in the circuit, which meter immediately indicates whether the steel has reached its critical point. The surface of the steel in time becomes non-magnetic, or, in other words, up to the critical point this is indicated on the meter by the approach of the needle towards the red line indicative of the critical point. As the heat penetrates the steel, and the interior is brought to the critical point, the needle of the indicator continues to approach the desired mark. This device does not measure what the critical point temperature is, and, though interesting, this knowledge is not relevant.

COLLISIONS and derailments caused but 3.9 per cent. of the total injuries received on the railroad systems of the United States during 1916. Negligence of passengers, employees, trespassers and others caused 30.1 per cent., while 66 per cent. of the total was in nowise connected with the operation of trains, but covered accidents, mostly trivial, in shops around stations, etc.

# Some Considerations Regarding Modern Plant Organization-III

By M. H. Potter

*The factors have entered into the successful manufacturing business to become more dependent to an ever-increasing degree. Location, type of building, transportation facilities, staff organization and plant equipment are features which require to be considered both singly and as a whole in relation to the particular product to be undertaken. A clear and concise [illegible] is necessary [illegible]*

COST accounting is a branch of general accounting and is the right arm of factory organization. It may be understood as providing for efficient records of the receipt and distribution of manufacturing materials, inventories of stores of materials, detailed accounting for expenditure for labor, productive and non-productive, a scientific treatment of manufacturing expense or establishment charges, processes and machines, the determining of the cost of operating machines, the rate to be charged for the work done by them, and the assembling of all these charges to show the cost of production of a unit, lot or process.

The cost of a product may be briefly defined as the outlay in money for materials, labor and all other expenditures which are necessary to turn out the finished article.

### Objects

The prime objects of all systems of factory organization and cost accounting are:

1. To secure the highest attainable efficiency of manufacturing departments.
2. To know the cost of manufacturing.
3. To ascertain whether or not a business undertaking is profitable, and
4. To provide a means of determining the basis upon which it is advantageous to all.

### Essentials of Proper Cost-Keeping

One of the first essentials in the keeping of manufacturing costs is an efficient accounting system, providing for a thorough classification of expenditure, subdivision of which may be as minute as practical requirements demand, to ascertain exactly the character and the amount of the expenses of operation and maintenance of the manufacturing plant. In designing an accounting system for a manufacturing concern the setting forth of the results of manufacturing and trading, the treatment of manufacturing costs, the classification of income and expenditure, the detail necessary and the general arrangement of the system, all are matters for consideration. No one business will be found to be exactly like another in its organization or in its business methods. According to the character of the manufacturing will it call for good judgment and perhaps some ingenuity in arriving at what will prove to be best suited to its peculiar requirements. For this reason it is very desirable that careful study of existing conditions should precede the introduction of a system of accounts for a manufacturing business already established.

Manufacturers have hesitated to adopt methods of which they had but little knowledge, believing that the introduction of a cost system would mean the superseding of all the accounts previously kept and the substituting therefor of a system of accounts containing much detail and both difficult and expensive to operate.

This may in part be attributed to the large number of manufacturers who have seen the industries they now control develop from small and unpretentious efforts to supply the demands of a limited community with their particular manufacture, to industries which, in many instances, are now of great importance. It is not to be wondered at that the conditions under which such tremendous strides were made should be considered equal to the requirements of the future, yet their continued success may depend upon an accurate knowledge of manufacturing costs.

### Adoption of a Cost System

The manufacturer may reasonably ask how much disturbance will be caused his operations by the introduction of a cost system. A workshop in which the production is not the result of complex operations presents a less difficult task than one comprising numerous departments with varied operations. A time limit should never be allowed to be a factor in the introduction of a cost system. The work of introduction is largely educative and it may take a number of months before results are obtained which may be considered satisfactory. Employees as a rule are not appreciative of systems whereby manufacturing costs may be obtained. Even in the office there may be objections to new methods, for nothing tries out and tests a clerical staff like the operation of a costing system, but with a reasonable knowledge of the principles underlying its operation it becomes a pleasurable study of interesting problems, an ever-widening field of investigation and an acquiring of valuable knowledge.

The introduction of a cost system will be materially affected also by the attitude of the executive head. The best cost system ever designed can have its working seriously impaired, if not negatived, in failing to receive the active, and more the determined, support of the manager. Weakness, indifference, or carelessness in shop administration will from the very first be brought to light by a cost system, and if the factory manager is a party to such faults, that is, if he allows shop evils to continue, which the new system will displace if carried out, and if he does not lend his assistance and authority towards that end all the time, then he must not complain if the successful working of the cost system is thereby materially retarded.

### Analysis of Costs

One of the most delicate problems which has engaged the attention of modern accountants is that of the proper division of costs, and experts are by no means agreed as to the exact classification of some items. A careful analysis of the problem of producing or manufacturing costs will reveal three elements as follows:

1. Material costs.
2. Labor costs.
3. Operating expenses.

(1) Material costs.—The organization necessary to obtain accurate material costs should begin in the purchasing department, for if the records of purchase and receipt of manufacturing materials are efficient it is reasonable to expect that the same orderly methods will follow in the distribution of materials to be used in manufacturing. The advantages of improved methods more than offset any extra clerical or other labor occasioned by them and where the manufacturing operations are on a large scale they are indispensable.

(2) Labor costs.—Labor may be divided into two classes—productive and non-productive. Productive labor can be definitely identified as belonging to a particular piece of work. Non-productive includes all labor not contributing directly to production, but necessary in that operation and maintenance of the shop or factory. For the purposes of obtaining labor costs the fact of labor being skilled or unskilled does not indicate to which class it belongs, although it is to be expected that skilled labor, in the sense in which this term is used will be productive.

The term "labor cost" is used to describe the cost of productive labor charged in the cost accounts to work in progress of manufacture. The tendency of this cost to increase, caused by organized effort to obtain increased remuneration for shorter working time, or from other causes, makes accurate cost absolutely necessary if the selling price is to be regulated to afford a satisfactory return to the manufacturer.

### Wage Systems

The systems of labor renumeration in general use are a rate per hour of time worked, and the ordinary piece-work system, whereby the workman is paid for the work he has done at rate per piece or equivalent thereto. These have been

output, thereby reducing the manufacturing cost while affording increased

This increase is effected by offering a the time adopted as the minimum time in which such work can be completed. The premium offered is practically sharing with the workman the value of the time saved in production. In doing this a saving in expenditure for wages is effected and allowing for extra strain on machinery and the expense caused thereby there is a further saving in the manufacturing expense.

### Time Records

Methods of obtaining labor costs are determined largely by the character of the manufacturing operations. It is to be kept in mind that the making of the records of the time chargeable to work in progress should not mean the loss of time of skilled workmen, nor does it mean the workmen doing that which it may not be convenient or practical for them to do.

The fact that the workman is the original source of information concerning the charging of his time does not imply that he be required to make the charge. The daily time-card is essential for use by the workman, and apart from his ability or his willingness to use it, and the economy of his doing so, it may be questioned if he is rendering the best value when actually making records, which a clerk by training and occupation is better qualified to do, and at what may

Therefore the methods it is intended to put in operation should be carefully reviewed. In some industries it is practical for workmen to furnish records of time worked and the nature of the work they are engaged upon permits this to be done without its being burdensome, of productive time. When the same class of manufacture continues from week to week, descriptive time cards, with divisions of time and names of the operations thereon only require to be punched as these operations are completed to show the time occupied on each. And in instances, repeating here what has been said of the of materials, the writing required should be reduced to a minimum.

Well-designed forms do much to assist in the making of shop records. Nothing which can be printed should be written, exceed what is actually needed. Simplicity of detail, if not another way of describing efficiency of operation, is at least very near to it. Under conditions which make it difficult for the workman to furnish records of time worked, recourse must be had to the time clerks, whose duties may also include the writing up of the pay-rolls and the entering of the labor costs of the various departments

### Analysis of Pay-Roll

Where workmen are engaged from week to week on continuous operations, or production of a similar character, an analysis of the weekly pay-roll may be made to obtain labor costs. The analysis must however, be based on absolute knowledge furnished by daily time-slips or cards, a foreman's daily report, or by a time clerk.

It is also practical and desirable in many instances that the arrangement of the cost accounts provide for the showing separately of different descriptions of labor or the labor of particular departments through which the work has passed in different stages of production.

### Operating Expenses

The operating expenses however are everywhere continuous, and therefore are a perpetual cause of concern to the alert factory manager. It not infrequently happens that, with a growing feeling of being unable to locate where the increased cost of manufacturing occurs, these items which can be indentified and valued are made the subject of closest scrutiny, with the result, possibly, that less valuable materials are used and wages are reduced. But the system in use may not provide for the accurate ascertainment of the overhead expenses so that manufacturing goes on with the same uncertainty of its character and amount. The conditions have not been improved, for if a cost system means anything it means ascertaining all the elements of the cost so that unnecessary features thereof may be eliminated while maintaining or improving the quality of the product.

Indefinite knowledge of the operating expense exists in many industries. To determine its character and amount accurately is of primary importance .

### Various Terms Used

A variety of terms are used to denote this feature of manufacturing expense such as shop charges, factory expense, on cost, and overhead expense. A sharp distinction should be made in every system of accounting for manufacturing concerns between manufacturing, selling and general or administrative expenses. The first two classes of expense are chargeable to manufacturing and trading respectively, and the third class of expense is chargeable against the profit from operating and trading.

In some instances a proportion of the expense charged to administration may be considered a fair charge to manufacturing. Such a contingency arises when an executive officer, and remunerated as such, with his devotes a large proportion of his time to the manufacturing operations. The expense in respect of rents, taxes and insurance can by a proper system of accounts be determined and apportioned monthly. It is necessary, perhaps to state that expenditure in this connection is intended to mean expense incurred without regard to the fact of whether the actual disbursements have been made for such items or not.

The next article in continuation of this subject will deal with the distribution of expenses on the machine, space, power costs and the idle time. The installation and working of a modern cost system will be described in detail.

## THE PASSING OF GERMAN INDUSTRIES

By C. T.

ACCORDING to authoritative information which has filtered through from Germany, with much weight behind it, there is much of interest in the condition of Germany's engineering and allied industries. The manufacture of an innumerable list of machine tools is being slighted and thus other industries are gradually going by the board. The manufacture of rails and railway equipment is below requirements so the magnificent net of German railways is going into a state of magnificent ill repair. The fabrication of shrapnel has replaced the fanufacture of lace and machines and loms. The fabrication of submarine parts has replaced the manufacture of locomotives, typewriters and sewing machines. The fabrication of shells and cannon has cut down the manufacture of agricultural implements. All the strength of the factory and forge is being sucked into the never-satisfied munitions business, the tentacles of which, furthermore, are continually drawing away the life-blood of other varied industries.

The steel industry has become a thorough-going war industry, one feature of which is the continued manufacture of imperatively needed staples. This industry has been so terribly pushed by the primary demands of the gigantic war business of the Central Empires and Turkey that it has not been found possible to produce sufficient rails and rolling stock for the railways, important as are these battle nerves of Germany in her efficient game of war. The Krupp people have established branch furnaces and forges in all parts of the country, likely with the idea of minimizing enemy opportunity for crippling the shell and cannon production. Furnaces have been operated for the Krupp works in France, Belgium and Asia Minor. Asia Minor is being developed into a metal treasure-trove for Germany and many millions of marks have been, and are being expended in the building up of mining properties there.

There is no longer a scarcity of metals in Germany. Copper is plentiful. Nickel mines in Anatolia are yielding considerable outputs. Serbia, Rumania, and Anatolia are now furnishing large supplies of copper.

Before the conquest of Serbia the metal outlook in Germany was dark and dreary. They stripped the roofs of large buildings and factories of their copper and conducted a painful house to house survey of the copper and nickel stores of the Empire. Ornaments, kitchen utensils, heirlooms, statues and bells, all went into the munition melting pots; and the kitchenware, at least, was replaced by coarse pottery.

The whole metal industry of Germany is concentrated on war, on the output of shells, bullets, armor plate, cannon, submarine parts. Every other business interest of the Empire is subservient to the demands of this industry. It is maintaining an atmosphere of hopeless hectic rush, and its activity and prosperity are surely ruining the country.

## THE WORST OF THE MACHINISTS TRADE

By D. A. Middleton

"THE worst of the machinist's trade is that it is so dirty." That remark is frequently dropped by doting parents and by youths who are making up their minds. And yet those same people will delve into the grease and grime of an automobile—the dirtiest kind of work—and, because they are not paid for it, will claim they like it. As a matter of fact, machinist's work is only relatively dirty, and only in special branches such as mentioned above is it necessary to get plastered from head to foot. It is noticeable that the best mechanics are the cleanest ones—they don't wipe their hands on their face, they have enough gumption enough not to lean on every machine they operate, and they keep their tools and work clean. Also it is noticeable that they are doing more or better work than their associates of the black face and greasy clothes.

That does not mean that there is not oil and dirt and discoloration in the shop, far from it, but one does not have to wallow in it to work there. A good man in a repair shop, which is apt to be the dirtiest branch of the business, cleans off a greasy part before he goes to work, he carries a small piece of waste in his pocket, and by its use cleans the smudges from his hands and the excess from the work and his tools as he goes along. No man can do good work when every time he picks up a part he leaves a sixty-fourth of dirt on it, dirt that mysteriously gets tracked on other parts nowhere near just as honey finds its way to the handle of one's knife.

The dirt of the machine ship is clean dirt anyway, and it all comes off in the wash. Would any machinist swap jobs with a plumber who has to straighten out a clogged sewer system, with an employee of a flour or cement mill, with workers in many lines that use waste materials and animal products? There are no odors of the business for a machinist to carry home, and if he chooses he may ride home on the car side by side a dry goods' clerk, looking fully as neat as the latter and conscious of a worth to his country not approached by the so-called genteel worker.

A visit to a fertilizer plant convinced the writer that a machinist's trade is usually plied amid most favorable surroundings. Their boiler feed pump did not work and I was sent on the job. The only spot visible that wasn't grease and slime and smell was the soft coal pile alongside the boiler. A fresh fire had just been put in and I chose this spot to unroll overall's and jacket and put them on. Outside in the yard, upstairs in the kettle room, everywhere, were carcasses in various stages of undress, dissection and decay. Well. I took the pump apart, re-packed it, and made adjustments and started it up. It worked finely, but no water. The suction pipe ran out underground to a pool fifty feet away. I ascertained that the pipe was not stopped up. Of course, the only other thing the matter would be a leaky suction and I wanted the line taken up. To this the management would not consent so I hurried to the coal pile to undress and get away.

The shop looked good after that and the soiled hands became clean and sanitary in my eyes. And I had to wear my best clothes for a few days while the others were airing way down in the back yard. Oh, yes, they finally came to it and took up the pipe line and discovered a split length which had made the pump failure.

## MACHINE EFFICIENCY COMPARISON

By J. H. R.

A MACHINE is no stronger that its weakest part. The evolution of tool steel for metal cutting purposes has necessitated a relative change in the design of the machine upon which it is to be used. The efficiency of high speed steel can only be determined when the limit of its usefulness is a comparatively well-established factor, and to do this it is essential that the machine be so constructed as to meet the maximum requirements of the cutting steel. The adoption of high speed steel resulted in greater cutting speeds and very often heavier cuts than generally practised with the carbon steel tools. Frequently, however, the forcing of a tool has demonstrated the advisability of exercising particular care in the manipulation of a machine before striving to obtain the limit of the tool capacity. The maximum cutting tool efficiency cannot be determined from machines that have not been designed for the heavy duty work accomplished on the more modern types of machine tools.

Invariably tools working under similar conditions will be operated at practically the same cost and efficiency. However, apart from the variable ability of the respective operators, no two machines can be expected to be operated under exactly identical conditions, therefore production can only be considered on a basis of machine efficiency when every component part of a machine is in complete accord with the qualities of the cutting tool. The end desired is the finished work, the means by which this is attained is the machine and the tools. Before the appearance of the high speed steels the weak point was invariably the cutting tools, the machine being generally capable of meeting the limit of possibilities of the carbon steel tools. However, when the quality of the tools was increased, as exemplified in the high speed steels, it was only a short time before the machine builders triumphed over the new development, until now the laurels are about equally divided. Some of the old machines are still doing good service but occasionally conditions will arise to show that in some particular instances they are not suitably adapted for extreme tests of heavy duty work.

A case in point was that of a small lathe that had been doing very good work of a certain description. Some shafts were wanted in a hurry, however, and, as the lathe ordinarily used for this job was heavily employed, the foreman prepared the light machine for the work. The larger lathe was accustomed to take heavier cuts at reasonably high speed, so the foreman thought the same would apply on the smaller lathe. Work was commenced, and the first shaft finished satisfactorily, but when the cut was about half finished on the second shaft the fireworks started; when the case was diagnosed it was found that several small gears in the apron would require dentist's treatment. As a matter of fact two new gears were necessary, and repairs required on two others, necessitating a shut down of the machine for several days. It is thus obvious that when striving to determine the efficiency of a machine it is essential that every consideration be given to the machine mechanism when forcing the cutting tools to a possible limit.

## CONVICTED CHEMISTRY

By R. M.

NOTHING appears to provide greater stimulus to the development and promotion of industrial and chemical science than the prosecution of a war, and this becomes additionally emphasized when the operations are on the tremendous scale of present world activities. For nearly sixty years scientific research and learning have been supported and encouraged, and institutions for its advancement have been in receipt of liberal financial endowments. In many instances community and government funds have been lavishly supplied for educational and experimental purposes. In the hope of attaining to a higher civilization men have been protesting and striving to eliminate the dominating feature of brute force that has periodically or spasmodically been manifest in the warring actions of the human race. Blinded in the belief that university investigations and scientific research have been of a constructive character and in many respects they have—we are to-day confronted with the appalling results of the advancements of so-called civilization.

Burns has said that "man's inhumanity

sent day, particularly in relation to the sible by the "advancements" of science, counts the mourners by the millions. To-day the nations of the earth stand horror-stricken before the evidence of brutalities practised by the various belligerents. The art of destruction has ne scientific but odious weapons of torture, decimation and death are exemplifications of what can be achieved through a misdirected utilization of scientific learning.

In the promotion of modern civilization (so called), crimes are being committed that makes the days of savagery look like play in comparison. Poison gases, air-bombs and liquid fire are among the many achievements that vie with each other for the destruction of mankind, not as individuals but as entire battalions. Chemistry, a name that should be the key to set humanity free, stands before the bar of history convicted of the most revolting crimes that have ever been perpetrated from the very

The destructive power of chemistry has created more blind men, has ruined the health of greater numbers, has maimed and destroyed the vitality of more human beings during the past three years than the curative powers of the said science can hope to prevent or safeguard during the next generation. Mars himself must surely be shocked by the perfection with which war is carried on at the present time. Instead of chemistry concentrating her efforts for the uplift of the human race the past three years has apparently demonstrated that in place of a guardian over the welfare of men she has become a trainer for this ghastly monster that threatens to completely destroy the equilibrium of the peace of the world. The present devastation should serve as a serious lesson for the development of the future, so that in some measure redemption may be possible for the loathsome acts that have resulted from chemical and other scientific achievements. This redemption can only be realized when the students of chemistry recognize their obligations to their fellows and utilize their knowledge and ability for the construction of a better and higher civilization than that which dominates the world at the present time.

## THE INDUSTRIAL SLACKER

By R. H.

MORE titles and honors have probably been conferred during the past three years than in any other similar period of the world's history. War is invariably a productive factor for heroic achievement. Honors are generally associated with recognized acts of bravery in the face of extreme danger. Titles, on the other hand, are usually bestowed for faithful service to a specific cause or purpose. A title or phrase, however, that reflects upon the character of the party upon whom it is conferred, is that of the odium "slacker." While this expression is primarily intended for those young men of military age that are practically free from domestic or business responsibilities and who have refrained from joining the colors, the implication is none the less applicable to many of those who at the present time are engaged in essential industrial activities.

Conscientious objection is a term often used by men to obtain exemption from military service, but few of these men show any compunction about accepting a job in a munition plant making shells at from $6 to $8 per day. Conscience, however, is a very pliable characteristic and can generally be moulded to suit the varying conditions in which we often find ourselves. Circumstances like the present demand that every man should conscientiously analyse his individual faults and failings so as to put himself right respecting his own responsibilities and his obligations to those of his countrymen who have accepted the challenge to give their lives, if necessary, for the cause of right and justice. If it is not permitted for us to take up the more arduous duties of the soldier and we find ourselves in a position where our efforts are devoted to the production of materials for the comfort and protection of these men, it behooves us to adapt ourselves to the situation so that in no sense can the term slacker be rightfully applied.

A notable feature in connection with the making of munitions is the progressive method of production. The routing of a shell during the machining operations has become one of the efficiency factors in the manufacturing problem. The successful solution, however, was often a matter of considerable concern to the various plant executives owing to the many difficulties contingent to maximum output and the vagaries of the human element. During the period of greatest activity, when the man problem was of much importance, the "floating" of machine operators caused considerable inconvenience. The high wages that were paid to the operators at that particular time was one of the chief reasons for the indifference of many employees. Taking a day off was a frequent occurrence for many men who were receiving double, or possibly treble, what they had ever done before. These men failed to realize that their absence often meant the temporary disorganization of the work in the shop as it was seldom possible to have certain machines idle when working to capacity.

During a visit to a large plant last summer the writer was told by the superintendent that during a certain race meet at a track about a quarter of a mile from the factory in the outskirts of a large city, that he was greatly handicapped by the men leaving at noon to attend the races, often as many as 5 to 10 per cent. of the men being present. The isolation of the plant and the inability to get new men to locate made it difficult to reproach the workmen for their neglect and indifference. Thus it is that the term slacker, apart from the meaning that it generally implies, can be very readily and rightly applied to many who are priding themselves on "doing their bit" in the manufacture of munitions and other essentials, but who in reality are only working for the abnormal remuneration made possible through abnormal conditions.

## INCREASING THE SAFETY FACTOR

By R. Hamilton

IN adopting safety methods in the factory it is good policy to solicit the assistance of the workmen in devising ways and means whereby the danger of accident may be minimized. Invariably, when a safety measure is adopted in a plant it is done so without previous consultation with the workman whom it is supposed to benefit. The disposition of the man is the prime factor in the success of any innovation, and in order to assure the greatest efficiency for a safety appliance or regulation it is well to impress upon the workmen the advisability of its use before applying the device to the machine upon which it is to be used. If it is seen that their co-operation is desired the workmen will adapt themselves more readily to methods that are evolved for their protection.

An effective device must be acceptable to the worker otherwise antagonism will follow its installation, and the result is liable to prove unsatisfactory owing to the initial prejudices engendered in the mind of the workman. Employees should be encouraged at all times to study the problem of the prevention of accidents, and induced to take an active interest in developing methods for their own and others' safety in the performance of their duties.

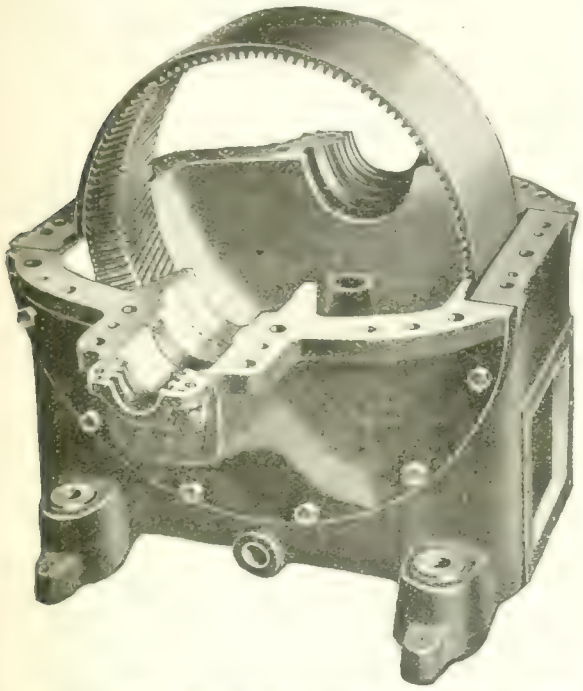
## OPENING FOR SMALL ELECTRIC PLANTS IN JAMAICA

CHARLES L. LATHAM, U. S. Consul at Kingston, Jamaica, B.W.I., reports that there is a good opening in Jamaica for small electric plants furnishing light for isolated country houses and power for doing the ordinary operations on the farm, such as grinding, pumping water, making butter, etc. Owing to the lack of development of water power here, electric current is available only in the larger centres, and there is a good demand throughout the island for individual plants at a moderate price. There is one outfit on the market at present which retails at about $400, and is capable of carrying 20 to 30 18-candle power lights at 32 volts.

The outfit should consist of a kerosene engine and a dynamo mounted on the same shaft, preferably, and a bank of storage batteries. The operation should be as simple and as nearly automatic as possible. Only oil-burning engines should be considered, as gasoline is altogether too expensive at the present time. Attention should be given to the method of packing and shipping so that the outfit can be set up by an ordinary mechanic.

## SPEED REDUCTION GEAR

RECENT developments in the use of prime movers having high rotational speeds have necessitated the employment, in many cases, of some form of speed reduction gear. The difficulties surrounding this application of gearing are well known. High peripheral speeds, proper lubrication, floor space occupied and lack of convenience and general adaptability combine to form a problem trying the designers' ingenuity.



LOWER HALF OF CASING, SHOWING INTERNAL GEAR IN POSITION

A new form of speed reduction gear has recently been developed by the Pool Engineering Co., of Baltimore, the design being such that it may be used for either step up or step down service.

The high efficiency of the gear has been shown in a recent test where the gear gave an efficiency of 98.5 per cent. as an average of five readings.

The torque of a direct current motor was measured by means of a Prony brake at a certain number of armature amperes, volts and field amperes, the speed also being measured. The motor was then coupled to the gear and the Prony brake attached to the gear. The load was then adjusted to give the same electrical readings and the torque then [illegible] to the first multiplied by [illegible]

Efficiency = T / 6.666

The totally enclosed feature makes it impossible for the workman to get his fingers or clothing caught in any rotating part or gear. This feature also makes for low maintenance cost and permits its use in wet, dirty, dusty or gritty places.

### Low Maintenance Cost

After installation there is little or no maintenance expense attached to the operation of this gear. The only attention needed is to see that an adequate supply of oil is in the reservoir. This may be contrasted with a belt or chain drive where constant attention is needed due to the stretching of belts or the wear of chains and sprockets.

Owing to the self-contained nature of this gear the cost of installation is very slight. It is only necessary to provide a firm foundation and to insure that the alignment of the gear and the driving and driven unit is perfect. When mounted in accordance with sound engineering practice this reduction gear is practically noiseless and works without vibration.

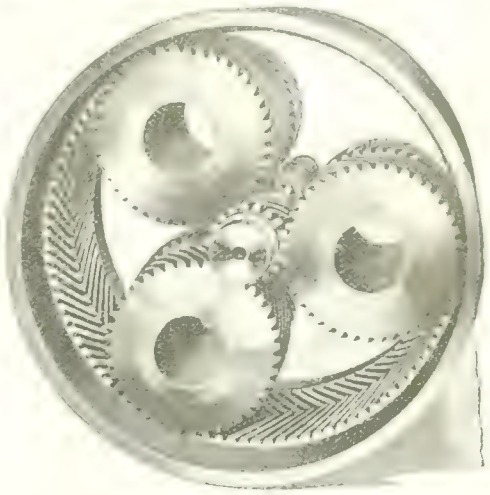
The casing is horizontally split, so that by the removal of the casing bolts the tops may be removed for inspection without disturbing the gears or shafting in any way.

As the high speed and low speed shafts are in axial alignment and all tooth pressures are balanced there is no tendency to deflect the shafts and produce unequal stresses on the bearings. The bearings merely have to support the weight of the rotating members. In the case of motors connected to chains or belts there is always considerable side pull on the bearings, this causing wear and often heating.

The high and low speed shafts are each independently supported by the casing. The low speed shaft is supported at each end by heavy duty S.K.F. ball bearings. One end of the high speed shaft is supported in a babbitt split bearing and the other end in a bronze bushing inside the cage, which forms a part of the low speed member. The pinion is cut integral with the high speed shaft and is allowed to float and [illegible] between the intermediate gears.

### Three Line Tooth Contact

Another advantage of the construction adopted is that there are three lines of tooth contact as compared to the one line of contact of the ordinary herringbone and pinion. This results in a lower [illegible]



GEAR MEMBERS

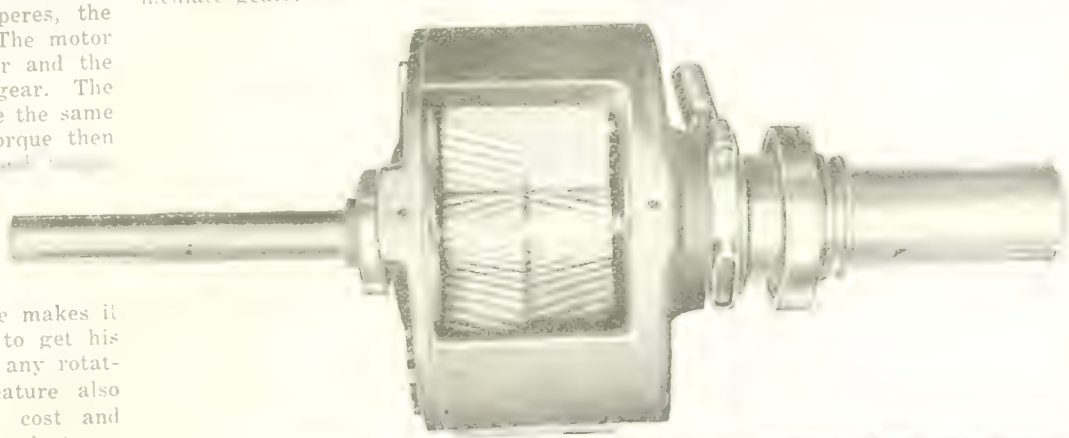
transmitted and consequently in a longer life.

The gear will drive in either direction without any changes and both the high and low speed shafts revolve in the same direction. Speeds as high as 6,000 r.p.m. and over are successfully handled.

### Turbine Drive

The high economy of the modern steam turbine makes it a desirable prime mover for the operation of various machines. Steam turbines to be economical must necessarily run at high speeds, yet many machines, such as centrifugal pumps, fans, generators, etc., require a speed much slower than that of the steam turbine. To reduce the speed of one or increase the speed of the other is a compromise which materially lowers the efficiency of both units. The mechanical speed reduction gear offers an admirable solution of this problem.

The extensive application of electricity throughout the industrial world has demonstrated the efficiency of motor



GENERAL VIEW SHOWING [illegible] AND INTERMEDIATE GEAR [illegible] REMOVED FOR CLEARNESS

drive. It is impossible, however, to secure a [illegible] motor and it will often be found advisable to purchase a high speed motor and to drive through a reduction gear.

### Construction

The gear members are cut by a [illegible] process which produces a true involute stub tooth of great accuracy and finish. These gears are not subjected to any process such as filing, scraping or polishing after being cut, as this is unnecessary.

This speed reduction gear consists of an internal double helical gear, see Fig. 1, made of a special analysis open hearth steel, forging heat treated to increase its ductility and to insure uniform hardness; a double helical pinion, Fig. 2, cut integral with the high speed shaft; intermediate double-helical gears shown in the same illustration made of high carbon steel forgings with large bronze bearings, mounted on hardened and ground steel shafts secured to the cast steel slow speed member.

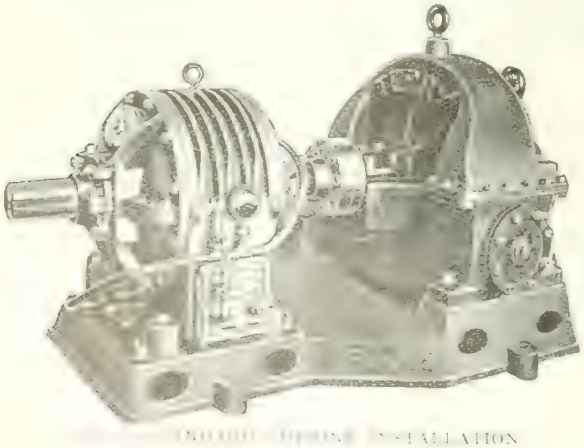
The high speed shaft and pinion as well as the slow speed members carrying the intermediate gears are accurately ground all over and are carefully tested for static and dynamic balance before being assembled.

The casing is made of tough, grey, cast iron, horizontally split. It is very substantial and well ribbed to provide a rigid support for the gear members, this insuring efficient and quiet operation.

The high-speed shaft has a central passage through which the oil is pumped, and continuous radial passages in the pinion. The oil after lubricating the gears and bearings is drained to the main oil reservoir in the base where it is filtered, cooled, returned to the pump and used over again.

### Operation

The internal gear is held rigidly in place in the casing and is kept from turning by means of two keys which slip into two keyways in the gear and casing. The pinion meshes with the intermediate gears and the intermediate gears mesh with the internal gears.



[illegible] INSTALLATION

Let us assume that we wish to drive a low speed machine with a high speed mover. The prime mover should be connected with the pinion shaft; this causes the pinion shaft to rotate and turn the intermediate or planetary gears. As the internal gear is held stationary, the intermediate gears must not only rotate but must of necessity revolve about the pinion shaft. This causes the low speed shaft, connected to the spider housing the intermediate gears, to rotate at the desired speed.

FIG. 1. TURBO-GEAR MOTOR LINE SHAFT DRIVE. 100 H.P. GEAR. SPEED REDUCTION 730-122 R.P.M.

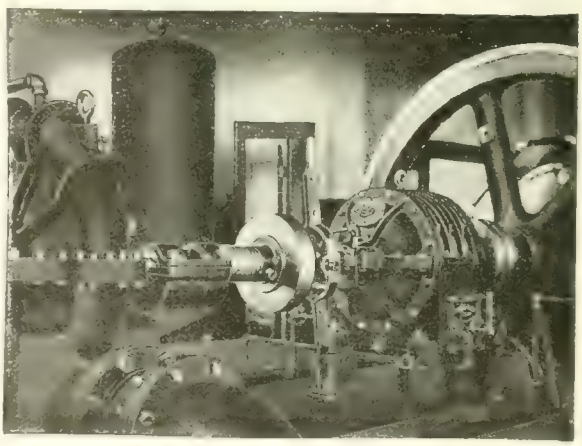
### Motor Line Shaft Drive

A very interesting application is found in Fig. 4, which shows two 100 h.p. motors direct connected to the line shafts through this device. It will be noticed that the gears and motors are mounted on base plates set upon concrete pillars.

An interesting application of a direct connected reduction gear and steam turbine is shown in Fig. 5. This illustrates a 100 horsepower turbo-gear direct connected to a Terry steam turbine reducing the turbine speed from 3,600 to 440 rev. per min., which is the speed of the driven unit—in this case a blower.

Two of the most noticeable features of this outfit are its compact and symmetrical appearance, together with the absence of offset shafts, the driving and driven shafts being in the same straight line. These features result in a considerable saving of floor space, as well as permitting a better grouping of the machines.

It is frequently found desirable to drive centrifugal pumps, fans, etc., with a low speed prime mover such as a gas engine. Fig. 6 shows an installation of this character where the engine speed is stepped up to the desired pump speed.



[illegible] 100 H.P. INSTALLATION STEPPING UP ENGINE SPEED TO THAT REQUIRED FOR PUMP.

## APPLICATION OF SHELL DISCARD STEEL

VARIOUS reports indicate a broader use of shell discard steel in rolling and manufacturing operations. It is believed that picks, crow-bars and digging bars are now being made largely from shell discard steel, while as already reported this steel, in the form of 1½-inch square billets, has become the regular material for stirring rods. No precise information is available as to the proportion of shell discard steel that is being used by the steel works for rolling light rails, but the common view is that this is now the chief material.

This steel is in general quite akin to rail steel in character. The carbon averages somewhat lower, in general, but as the manganese is higher the material is fully as hard as rail steel. The phosphorus and sulphur are somewhat better.

---

THE most economical total load for belting must lie between 174 and 357 lbs. per square inch of section.—Belts.

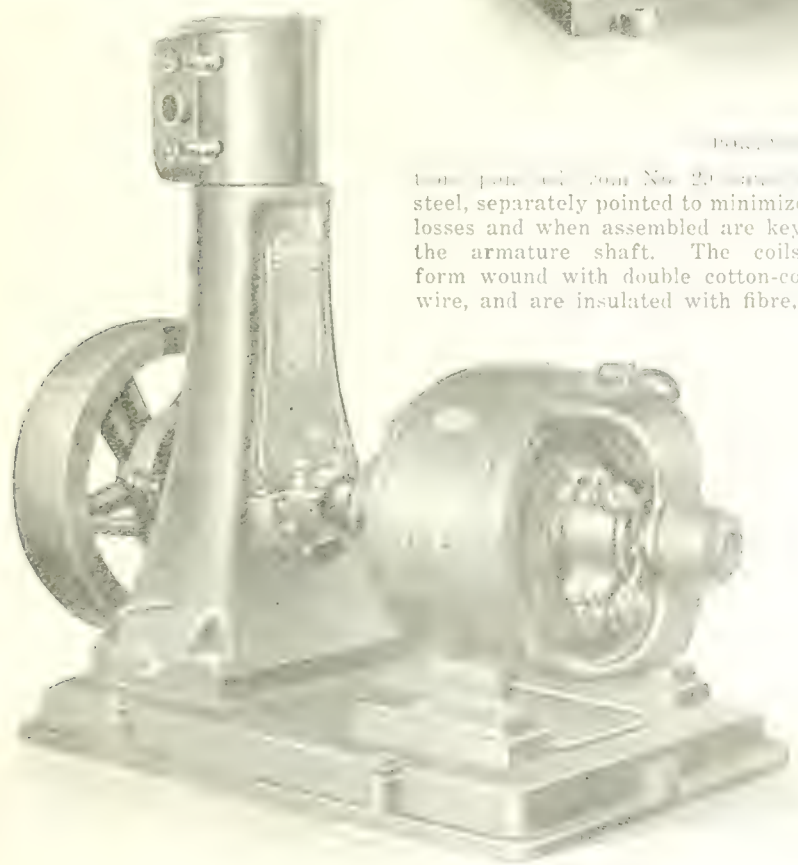
# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## SHIP LIGHTING UNIT

THE above illustration shows a unit lighting set particularly adapted to the lighting of ships. The Watson seven and one-half kilowatt generator is direct connected to a Canadian Sirocco high-speed vertical engine all mounted on one base.

The engine operates without noise or vibration, is oiled automatically, and is of the enclosed type. Lubrication is ample at any speed, and is not affected by the wearing of bearings, etc. Oil is separated from the water, cooled and filtered at every circuit. Careful analysis of hundreds of repairs ordered for engines lubricated with sight feed oil cups showed conclusively that over 80 per cent. of the repairs were due in one way or another to insufficient lubrication. The forced lubrication system with which these engines are provided enables them to run steadily for from three months to a year at high speed and full load without the adjustment of a bolt or screw or any additional oil after the first filling.



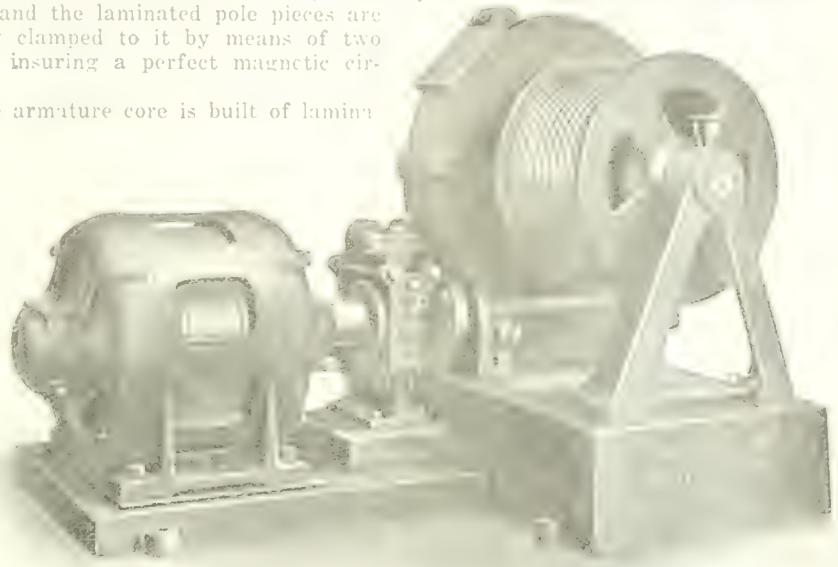
SEVEN AND ONE-HALF KILOWATT DIRECT CONNECTED SHIP LIGHTING SET

This is made possible by the positive feed of oil to every bearing and wearing surface from a pump in the base of the engine, driven through gears from the crank shaft.

The Watson generator which forms part of this unit is carefully tested during construction, and after completion with regards to mechanical features and electrical characteristics. The field ring is cast from a high grade of dynamo steel and the laminated pole pieces are firmly clamped to it by means of two bolts, insuring a perfect magnetic circuit.

The armature core is built of lamina[illegible] steel, separately pointed to minimize core losses and when assembled are keyed to the armature shaft. The coils are form wound with double cotton-covered wire, and are insulated with fibre, linen tape and high-grade insulating varnishes. The complete armature is given a running balance to eliminate vibration.

The sleeve bearings which form part of this generator are cast from bearing bronze, and are so designed as to align against a shoulder in the head casting. They are held in place by a fixed key instead of by the usual set screw. Oil cups are provided which serve the double purpose of a filling device and an overflow.



[illegible]

The brush holders are of the box type with radial feed, which prevents the shifting of the point of contact due to brush wear.

The A. R. Williams Machinery Co., Ltd., Toronto, Ont., are the Canadian agents for this equipment.

## PORTABLE ELECTRIC HOIST

THE accompanying engraving shows an electrically-driven hoist which is readily adaptable to the handling of material around yards and stores. It is operated by a standard A. C. motor which is supplied to suit various voltage and cycle requirements.

The motor drives the 12-in. diameter drum through worm gearing, the capacity of the output being 1,500 pounds. The drum is capable of overhauling 50 feet of ½-inch cable, and, as originally designed, the hoist was arranged to elevate material, reverse automatically and come back to charging position.

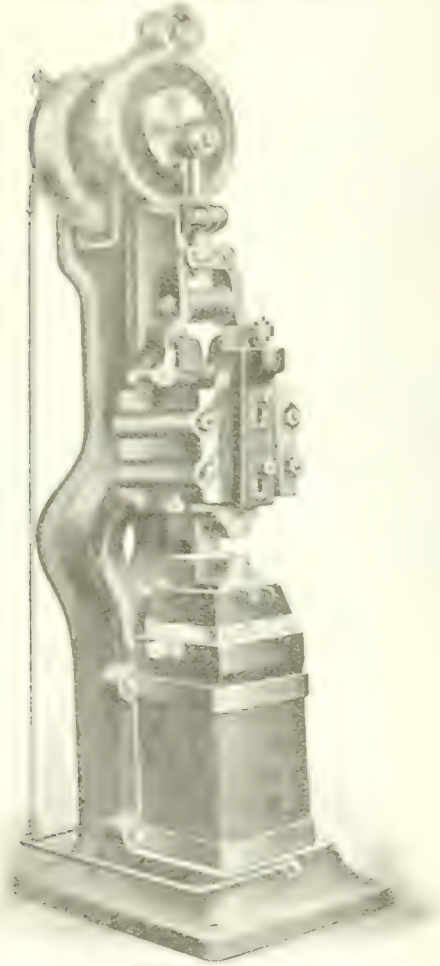
The motor is provided with standard reverse control, or where special requirements make it necessary specially designed controls can be designed to suit.

A magnetic brake of the horseshoe type is fitted. It is of simple and rugged construction, is not liable to jam, and insures a dead stop by the motor immediately the current is cut off. This hoist is the product of the Volta Manufacturing Co., Welland, Ont.

### POWER HAMMER WITH ADJUSTABLE TAPER GIB

The accompanying illustration shows a [illegible] power hammer as built by the United Hammer Co., Boston, Mass., in which provision has been made for the adjustment of the ram guides, so that a much finer ram adjustment can be obtained than hitherto.

The hammer is of the overhead crank type with adjustable stroke; the capacity under the ram being altered to suit requirements by adjustment provided on the connecting rod. The detachable anvil block is securely strapped to the column, which has an opening to accommodate work of unusual length or shape.



POWER HAMMER WITH ADJUSTABLE TAPER GIB

The ram guides are fitted with an adjustable bronze taper gib taken up accurately and quickly, and the gib and face plates have been so designed that they may be fitted to hammers of this type, which are already in use.

### A SMALL BENCH LATHE TOOL-HOLDER

THE accompanying illustration is an actual size view of the smallest bench lathe tool-holder on the market. It is manufactured by the Ready Tool Co., Bridgeport, Conn., and is known as their New Style O O Tool-holder, and in getting out this tool-holder the manufacturers have considered particularly the requirements of users of bench and watch lathes. Any size of holder required in these lathes can be secured.

The tool-holder is a fine quality of drop forging broached with a perfectly square and true hole for the cutter. The cutter furnished is finest grade of high speed steel treated by Taylor-White process. These tools are nicely finished and sent complete with a 3-16-inch square cutter and wrench. The size of the holder is 5-16 inch x ½ inch x 3½ inches.

ILLUSTRATION IS EXACT SIZE OF TOOL HOLDER

### UNIVERSAL CYLINDRICAL GRINDER

THE grinder illustrated is similar in some respects to the universal cutter and tool grinder, also manufactured by the Oakley Machine Tool Co., Cincinnati, but is particularly adapted to regular shop manufacturing operations. The grinder is fitted with a longitudinal power feed, thus insuring a smooth and even traverse of table and rapid production. A small handle at the front of the machine operates the power feed and the drive is through the table feed screw instead of by the customary rack and pinion. To allow the wheel to grind clean at the shoulders there is a short pause of the table before reversing.

The stop dogs provided with this machine are hinged so that the operator may run the work past the setting to measure both external and internal work.

Wet grinding may be used for tools where preferable and the attachment provided can be set up in a few minutes.

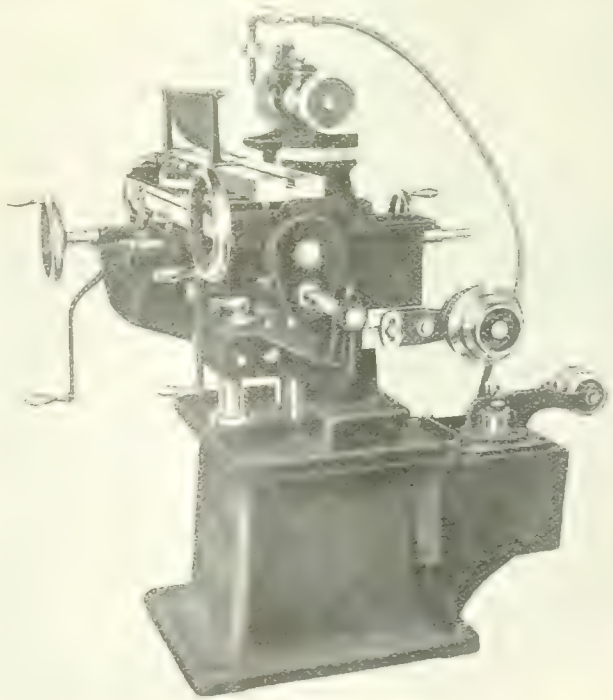
The column is bolted solidly to the base casting. The dovetail bearing for the knee overcomes the inaccuracy inherent in constructions depending upon swivelling of the operating parts around a small circular column.

The knee is of the box type and is provided with a taper gib which takes up wear and insures a solid accurate bearing during the life of the machine. Broad vees on the knee 16 in. apart give good support against rocking of the saddle.

The table is supported by ample bearings in the middle and at both ends. When grinding at right angles to the wheel it is never necessary to swing the table beyond the end supports as the wheel head itself swivels.

The wheel head swivels on column 180° either side of the center. Large graduations are provided for its proper indexing and dust proof taper bronze bearings insure accurate running.

This grinder has a longitudinal movement of 17 in., a vertical movement of

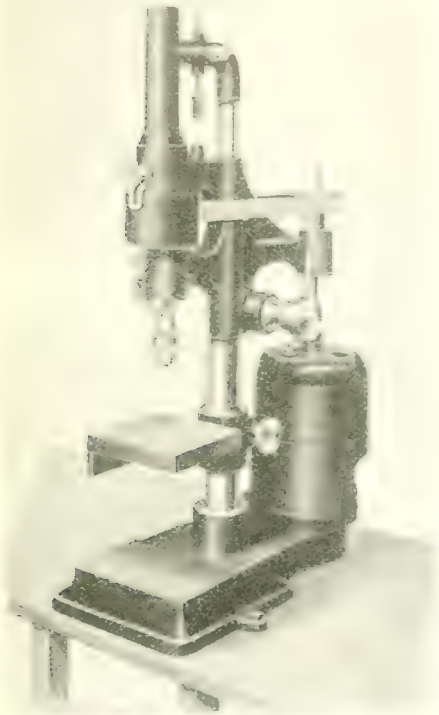


GRINDER EQUIPPED WITH POWER LONGITUDINAL FEED AND WET GRINDING ATTACHMENT.

10½ in. and a cross movement of 9 in. The table is 5¼ x 33¾ in., can be swivelled 270° and is provided with a taper adjustment up to 2 in. per foot. The maximum swing is 10 in. and the maximum length between centers is 20 in.

## SENSITIVE BENCH DRILL PRESS

THE high speed sensitive drill press illustrated in the accompanying engraving is manufactured by the High Speed Hammer Co., Rochester, N.Y. Weighing only 60 pounds the drill press is readily portable. The standard spindle speeds are 2,100 and 6,000 rev. per min. and



SENSITIVE BENCH DRILL PRESS

special pulleys can be furnished for driving main spindle at any speed up to 10,000 rev. per min.

The main spindle is heat treated and ground to size and is guided through a bronze quill supported at each end in an annular ball bearing. End thrust is taken up by an end thrust ball bearing under the feed arm.

The table has a working surface 5½ x 5 in. and will take work up to 4⅜ in. in height. The surface of the table is ground to insure accuracy. The table has a self cleaning bevel which keeps the ground main column free from chips and which also serves to guard the columns from injury.

The base has a ground working surface 4 x 6 in. and will take work up to 7½ inches in height. The base has an oil groove and a self cleaning column support. A special feature is furnished in a locking device which enables the operator to change drills without his hands coming into contact with belt or pulleys.

An idler pulley takes up any belt stretch which may occur in the endless woven canvas belt without impairing the efficiency of the machine.

The front pulley and upper part of the spindle are guarded by a semi-tubular guard, insuring safety. The machine may be operated either by hand or by foot control.

## SHOP MAIL BY TRICYCLES

THE Westinghouse Electric & Mfg. Company has departed from the old and slow method of delivering mail through its East Pittsburg works by means of a boy on foot, which required from three to four times longer than the newly-adopted method to deliver a piece of mail from the central mailing department to one of the outlying buildings.

The first improvement in this direction was that of the storage battery truck fitted up with racks similar to those used in a post office. This truck made trips throughout the works collecting mail and sorting it while the truck was on its rounds. This was found to be a considerable improvement over the old method, but on account of the trucks being large a great deal of time was lost in waiting to get through aisles where material was being loaded and unloaded. The truck required the services of two men, one for the sorting of the mail and one for operation. The new tricycle, which is 11½ inches narrower, costs considerably less, in fact 8 tricycles can be purchased for the cost of one storage battery truck, and it requires the services of but one boy to handle the mail and tricycle.

A great deal of time is saved in delivering mail from the central mailing office to the farthest outlying building, a distance which requires a 12 minute walk for a boy to cover, whereas a mail tricycle will make the trip in about 5 or 6 minutes and will carry three times as much mail as the boy can handle. At the present time there are four of these tricycles in use and an extra one is held in

TRICYCLE USED FOR SHOP MAIL

reserve for emergencies. Each tricycle will cover approximately three-quarters of a mile per trip, and the time will be between 30 and 60 minutes per trip.

These vehicles are of regular bicycle construction and were originally designed for use as delivery vans by small merchants for handling packages of light weight, a covered basket being attached to the front, but for factory use a sheet metal sorting box was substituted. There are twenty-two small and three large compartments, each having a metal label. The lower portion of the box has been divided into two large compartments for handling packages, and long rolls of blueprints which are too large to be handled in the upper compartment. When these are used a bright colored card is placed in the smaller compartment above marked to show what packages are below, this serving as a reminder to the operator. The total weight of the outfit is about 150 pounds and includes 1½-inch rubber tires, cyclometer, auto horn, etc., and is quite easy to operate on the grades.

Under the present management, where size will permit, all mail of light weight for the works is forwarded by a pneumatic mailing system; mail too large for the tube system is handled by the tricycles; and extremely heavy packages such as packages of stationery, screw machine details and other small parts will be handled by a works departmental express truck which will soon be placed in operation.

## MACHINERY MARKET IN BRAZIL

AS to the requirements of Brazil generally these are exceedingly diverse. In one market alone—that of mining machinery—there are boundless opportunities for the British manufacturer. Mining is, however, but one phase, and one phase only, of the republic's industry. Agriculture, which forms so large a share of the people's occupations, demands increasing supplies of implements and machinery; the many large towns are purchasers of electric lighting machinery, pumping plants, steel rails for tramways and mines, iron and steel manufactures, motors and stationary engines, tubes, structural material, tools, cement, and sewing machines. Windmills, refrigerators, huge quantities of barbed and plain fencing wire, lubricating oils, and innumerable other articles of a similar nature are constantly in repuest.

Neither should the great sugar producing industry be overlooked, with its demands for the latest type of crushing plant and distilling apparatus, while a further opening in the engineering line is to be found in connection with the many irrigation plants and installations of pumping works that are being installed, in addition to the equipment of numerous plants, large and small, to make use of the hydro-electric power available.

The most important of all Brazil's manufacturing industries is, however, that of cotton textile. The principal cities and towns in which textile machinery is needed are those of Rio de Janeiro, Sao Paulo, Petripolis, Sorocaba, Maranhao, Pernambuco, and Bahia.

## TRADE BALANCE COMPELS EMBARGO

THE decision of the Canadian Government to correct the adverse trade balance by means of an embargo on selected imports should be welcomed by the majority of industrial circles as being both necessary because of present conditions and desirable in its probable effects on future trade expansion.

The list embraces a wide range of articles which affect the general public more or less directly and include many items which are now manufactured in Canada, but are subject to competition from imported articles made under more favorable conditions as regards quantity production and supplies of material. Intensive advertising and, in many cases, advantageous patent control have frequently militated further against home manufacturers.

Three immediate results should arise from the pending action. A substantial reduction in the trade balance should be rapidly effected: home production will be increased to a degree where economies arising from increased output may be effected: holders of Canadian patents who have limited their production here to a minimum while importing largely will be unable to do so longer and additional branches of industry are probable in this respect alone.

While many of the articles which it is proposed to prohibit are more or less in the nature of luxuries, the return of normal international trading conditions will find many of these in the lists of competitive exports and full advantage should be taken by every manufacturer whose production will be stimulated for some time to come.

Automobile manufacture has had a considerable footing here for some years although imported parts and chassis formed the bulk of the business. Tire factories are well established,—silverware, musical instruments, footwear and clothing have all been made here of high enough quality to suit the most fastidious and permanent enlargement of these activities alone will be of considerable benefit to many centres of industry long after the present financial conditions primarily responsible have been overcome.

The working out of the details by the Canadian War Board in consultation with those interests directly affected will be awaited with interest and confidence. The personnel of the board is ample guarantee that developments will be for the greatest good of the greatest number.

Similar action by the States is expected and its reactive influence on other lines here is the subject of much interested anticipation.

## INDUSTRIAL CO-OPERATION.

PROBABLY never in the history of the world has the great need for co operation between capital and labor been so pronounced as that of the period of revolutionary developments through which we are now passing. Few cannot but be impressed with the absolute necessity of "carrying on" to the very limit of our capacities. The present is no time for dissension and strife, with the natural consequence of decrease in production. The strain upon the country's resources, in the constant drain of men and material, has made it imperative for all to put their shoulder to the wheel, so as to maintain a steady, though oftentimes seemingly slow, progress to that end we have in view, namely, the successful prosecution of the war. Sitting still and telling others how they should proceed is not a man's work under existing conditions. What is required is that everyone should get out and push, thus lessening the load and making it easier for those who have, so far, assumed the greater portion of the burden.

The belief is becoming prevalent that the day of labor is approaching when the workingman's voice will be heard in the different councils of the world. Revolutionary changes have undoubtedly taken place during the past three years that will hasten the realization of their ideals—or rather ideas, as it is very improbable that the former will be achieved by the present, though waning, methods of agitation and strikes. However, even with the possibility and hope that a better day may dawn for the masses of the people, as a result of this devastating war, the present is surely no opportune time to throttle the valve of industry and agriculture and choke the flow of productive energy that is so essential to maximum attainment in every line of the country's activity.

While many of us may feel the apparent injustice of certain conditions, we should nevertheless realize that the sacrifice we at home are asked to share is almost infinitesimal when compared with what the soldier at the front is forced to endure, and that invariably without complaint or murmur. We here, far back of the actual firing line, have voluntarily taken on obligations that are equal in importance to those of the boys suffering untold dangers and hardships in the front line trenches. To forego these obligations would be to experience abject humiliation of our very manhood. To fulfill these unwritten promises and likewise pay in full the indebtedness are moral obligations placed upon, and practically accepted by, every individual citizen.

Unrestricted production of essential requirements, conservation of all resources, elimination of waste, are the foundation stones of success; unification and co-operation are the key-stones upon which the stability of the construction depends. Maximum efficiency is only possible where the co-ordination of capital and labor are based on a mutual understanding tending to perfect harmony in manufacturing operations. Conservation of material and the elimination of waste are educational features of vital significance under present circumstances, and their future importance cannot be underestimated. The shortest distance between any two points is a straight line; therefore, to attain the fullest realization of our present objective, it is obviously essential that industrial friction be entirely eliminated during the prosecution of this purpose. Employees should exercise fortitude in any seeming hardships they are called upon to endure, and employers should recognize their responsibilities to these workers and those men overseas whose sacrifices are equal to, if not greater than, any the manufacturer is called upon to face.

# In Developing the Future Trade of Canada The Question of Tariff Must be Considered

## C. F. Parsons, President of the Canadian Manufacturers' Association, Claims That it is Useless to Try to Develop Trade While it is Discouraged by Drastic Changes in the Tariff—Believes That Scientific Study Should Be Made of the Whole Situation.

"DISCUSSING trade conditions after the war, apart from their bearing on the matter of tariffs, is of little or no use. The two go together, and they cannot be separated. Trade cannot be developed apart from tariff regulations, and that might as well be faced at the very start."

That is the ground from which C. F. Parsons, President of the Canadian Manufacturers' Association, starts his reasoning when he discusses the big problem of Canada's trade, especially of the export sort, after the war. Mr. Parsons has the happy faculty of sticking to the point. He discussed the matter with a representative of CANADIAN MACHINERY a few days ago. No matter how far afield the talk ran, when it reverted to trade matters Mr. Parsons would keep his Trade and Tariff point to the top like a sore thumb. Apparently he reckons that his Two T's make a good tandem, but are not worth spoiling pasture on if an attempt is made to keep them alone.

### Reduce the Overhead

"If the Canadian manufacturers want to get in shape for the jolt that will come after the war, the time for the start to be made is right now. Don't let us make the fatal mistake of waiting until the acute situation is here. Although the war is our big problem at the present moment, the conditions following are so closely related to it that it's hard to separate them.

"The manufacturers of Canada," continued Mr. Parsons, "must realize that they will have to come together to reduce their overhead charges, not only in the ultimate disposal of the goods, but in the manufacture of them as well. We must come together that we will to a large extent cease fighting each other, and turn that energy into fighting for trade. The best brains of the land should get together. I don't mean that we should of necessity go in and copy the German system, because they were sinning against several very real economic laws in the pursuit of business. Sooner or later the inflation is bound to come out of such forced business, and then come depression and trouble."

CANADIAN MACHINERY representative here referred to the organizations that were springing up in the Old Country to meet the efforts of Germany and Austria, the latter including the purchase of the Woolfe News Bureau by the Krupp interests. The Old Country expects competition from Japan and United States to be keen also.

C. F. PARSONS, PRESIDENT CANADIAN MANUFACTURERS' ASSOCIATION

"It is interesting to note what is being done in Britain," replied Mr. Parsons, and to think that they are able, in spite of the tremendous war burdens, to plan for after-war trade, but conditions differ. Britain has five times our population, and her people are more centred in industrial pursuits than in this country. Then, too, it is much easier to control the transportation problem there."

### Wants One Central Board

"We could make a very good start in Canada by having a Trade and Tariff Board. I would apply the dual name to the organization because we must realize in Canada that these two things travel together. Let's get that clear at the start. It's no use talking about trade unless we include the tariff side as well. We are living alongside a nation that, under its low tariff, has an average trade protection of 25 per cent. above ours. That is the actual condition we have to face. This Trade and Tariff Board need not be a large or cumbersome body. It should be part of the machinery of the Government, and from the Government we should receive a direct and straight lead. The board to which I refer would make a scientific study of the whole question from a national standpoint, and would include not only manufacturers of all kinds, but the agriculturists of the Dominion. I believe in giving every needed stimulus to farming, but I do not believe in doing it at the expense of other interests. A scientific study of the whole situation would lead to all having fair play.

### Discouraging Trade

"But let's get back to the trade matter," continued Mr. Parsons, "and see how it can be discouraged as well as encouraged. Last week we were at Ottawa presenting the claims of the Canadian manufacturers and discussing a number of recent restrictions. The tractor situation took up our attention to a considerable degree. I can state the case of one Winnipeg man. He was prepared to start the manufacture of these machines in his city. There are 500 soldiers out of work in that city right now, and he figured that he would be able to provide employment for 200 of them. What happened? When the Government announced its policy of bringing in tractors free of duty without rebating the duty on the raw material brought into Canada for their manufacture here they simply quit. And I know of half a dozen other plants, most of them in Ontario, that are in the same position right now. What follows? Labor will not be employed, and when the munition plants are closed down the num-

(Continued on page 365)

# Extension of U.S. Prices Has Effect of Making the Canadian Market More Steady

## United States Shipbuilding Programme Is Most Encouraging One—Pittsburg Reports An Increased Output Of Pig Iron—Nova Scotia Mining Reports are Not Encouraging.

AN old saying can well be applied to the iron, steel and metal markets this week, viz., that the mountain has labored and brought forth a mouse, the mountain being the much talked-of changes that were due on the last day of the month just closed, and the mouse the one dollar cut on the price of pig iron. The one price change makes little difference to the Canadian market, although its action may be felt in certain specific lines later on. The supply of pig iron has been short in Canadian centres, and a number of manufacturers have been looking about for some time to see if they could locate a larger supply. News from Pittsburgh is to the effect that the blast furnaces there are making a near-normal output, and that prospects are for a continuance of this performance.

Big buying is going on in United States for equipping war shops, and there is a warning in market reports out to-day that this is likely to result in an upward tendency for the figures on machinery and machine tools. This has not worked in the Canadian market yet. The announcement of United States ship-building plans is worthy of note. It puts rather an effective quietus on the stories that have been persistently circulated to the effect that the Republic was going to fall down sadly in this regard. It is confidently expected that United States' building programme for this year will account for five million tons of new shipping.

Manufacturers buying steel plate in Canada are having a hard time to compete with U.S. firms in the same line of business, although the latest embargo, which has been announced with the purpose of equalizing the trade balance, may yet have some bearing on this matter.

Business in machines and machine tools continues brisk. Large size chucks are hard to secure, varieties from 12 inches up coming under this ruling. Metals and oils remain steady with trade brisk. Scrap dealers are not keen to stock up farther at list prices, although a fair volume of business is still being transacted.

## PLATE OUTPUT KEEPS SHIP WORK BEHIND

### Conditions in Montreal Nearly Normal With Clearing of Tracks

Special to CANADIAN MACHINERY

MONTREAL, Que., April 1, 1918.—Industrial conditions are gradually assuming more normal proportions owing to the betterment in the weather and the clearing of the snow; the transportation of freight is still a factor in the present situation, as the railroads are not yet free from the congestion of the recent months. The near approach to the opening of navigation has been reflected in the subdued activity in marine circles, and before the close of the current month considerable relief will be given to the railroads. Good progress is being made in the construction of steel and wooden vessels, both here and in the States, although the shipbuilding programme in both countries has been a little delayed owing to the inability to obtain sufficient plates for maximum operations. Satisfactory progress, however, has been made in the launching of boats in the States. Labor unrest may be a factor in the next month's development, although an agreement has been reached between representatives of capital and labor that industrial disputes will be considered and settled by a Government [illegible], so that no disorganization of activity will arise while the needs for production are so imminent. The steel market has become steadier as a result of the announcement of an extended period for the prevailing prices on steel products.

### Steel

The general market conditions of the steel situation have become additionally stabilized following the announcement of the American Government that the prices effective during the past three months will remain in force for the next quarter, if not longer. This decision has added firmness to the present position of steel, and may have the effect of increasing the production. One of the prominent steel dealers here expects that the situation will retain its stable character for the next six or nine months, subject, of course, to unforeseen developments. In order to strike a better balance in the cost of production and assist the producer in operating mills and furnaces to capacity, the Government has revised the price on basic pig and steel scrap; the former is now quoted at $32 per ton, while the price set for heavy melting steel scrap is $29 per ton, both these revisions representing a reduction over the old price of $1 per ton. The negotiations between the Canadian Government and the various steel interests has finally culminated in the placing of a contract with the Dominion Iron and Steel Company for the construction of a plate mill, with the object of increasing the supply of ship plates for the future needs of the Canadian Government and private shipbuilders. It is expected that approximately $4,000,000 will be spent in the erection of the mill and the installation of the plate rolling equipment, and it is anticipated that the plant will be in operation in about 18 months. Nothing definite has been announced as to when the work of construction will be commenced, but negotiations are now in progress with this end in view. Owing to the heavy demands for plate rolling machinery the Dominion Steel anticipate some difficulty in securing the equipment necessary for the new plate mill, and, as one of the officials stated, it will be necessary to obtain the desired machinery wherever the same is available. An easier market, but with firm quotations, prevails in local circles. Dealers report better deliveries of material, but in some instances shipments have been practically lost owing to the inability to trace the same. This condition, however, is fast becoming rectified and transportation of freight is rapidly becoming more normal. The local plate situation has an easier tendency, but dealers are content to quote the same price that has prevailed for some time.

### Metals

No outstanding developments have taken place during the week and the metal situation is much the same as that of last week. The better movement of freight upon the railroads has given some relief to transportation problems, but the situation is not yet all that could be desired. It is expected that the attitude of the Government in respect to the revision of copper prices will be similar to that recently taken regarding the steel conditions, and few are looking for any marked change in the price of copper for ensuing period. Tin is in great demand owing to the shortage and the inability to obtain adequate supplies. Spelter, lead and antimony are inclined to weaken, while aluminum is developing strength.

**Copper.**—The market has taken on a still further tone of firmness following the attitude of the American Government respecting the revision of steel prices. From this action it is anticipated that the present prices now effective will remain in force for an extended period after June 1st. War requirements are constantly on the increase, and domestic consumers are feeling more and more the restrictions that are placed upon their obtaining of metal. While production is somewhat over the existing demand, the larger producers are retaining considerable large stocks to take care of any sudden demand from Government sources. Eventually the situation may be such that plenty of metal will be available for private distribution. Local dealers continue to quote 29c and 30c per lb. on a steady market.

**Tin.**—The tin situation continues to maintain a very acute position owing to the inability to obtain sufficient metal to meet the requirements of the trade. Business is still done in considerable volume, but principally on futures, as no spot metal is at present available. The importation of tin from the East is dependent upon the obtaining of shipping permits, and the uncertainty of definite assurance in this respect has a tendency to make the dealers reluctant to take orders for specified delivery. The situation in the States is very firm, but all quotations are of a nominal character. The local situation continues to be somewhat unsettled, but dealers report a little easier market, with prices easier; present prices are on a basis of 98c per lb., this being a nominal figure.

**Spelter.**—Increased supply and greater pressure to sell on the part of holders of metal has influenced the market and prices have shown a tendency to decline. The consumers are not showing any anxiety to buy, and the market is becoming stagnant. The prevailing quotation on the New York market is now 7¼c, this being ¼c lower than last week. Dealers here report a slow market, with an undertone of further weakness. On a decline of ½c the quotation is 10½c per lb.

**Lead.**—Freer offerings to sell has developed a weaker situation and the tone of the market is downward. The tendency is reflected in this week's quotation on the local market, which shows a decline of ½c over that of last week. Dealers' prices are on the basis of 10c per lb.

**Antimony.**—The market is developing an easier tone as a result of the increasing supply and the slight falling off in the demand. The price in New York has fallen off ¼c, the quotation being 12¾c. Dealers here are asking 17½c, a decline of ½c per lb.

**Aluminum.**—A steady market is maintained on aluminum and the tendency is upward. Local quotations are 55c per lb.

### Machine Tools and Supplies

The general activity in the machine tool industry during the past week has been less pronounced than formerly and the demand for equipment is confined to the replacement of tools that have become ineffective for maximum production. A notable feature in connection with the manufacture of the American shells is the adoption of machinery that is designed and constructed in the plants that are engaged in this work. The experience that has been acquired on the other class of shells has enabled firms to develop special tools that are highly applicable to efficient operation for special purposes. Some little business has been reported in the placing of contracts for shipbuilding machinery, but inquiries for the heavier machine tools is comparatively light. Dealers still report considerable difficulty in obtaining anything like reasonable delivery on tools coming in from the States. The general demand for all classes of small supplies is well maintained, and prices on this line as well as the heavier tools are very firm.

### Scrap

The scrap situation has improved very little over that of the previous week, and buying is exceptionally light, consumers contenting themselves with just sufficient material for immediate needs. The Canadian demand for steel scrap at the present time is not very heavy, and the embargo still in effect prevents the free shipment of material to the States. This condition has the tendency to unsettle the market here, at the same time maintaining the future in a very uncertain tone. Dealers report an undertone of weakness, but are retaining the quotations on the basis of those listed last week.

## POINTS IN WEEK'S MARKETING NOTES

**Toronto dealers claim that steel plate prices will become easier, as it is necessary for the figures to be brought nearer to the level of prevailing U.S. quotations.**

**Supplies of high speed steel both in Toronto and Montreal are being seriously depleted, much faster in fact than there is any prospect of replenishing them.**

**Machine tool dealers find it harder to get the larger size chucks from American firms. U.S. government requirements make deliveries on anything over 12 inch more uncertain.**

**Canadian dealers think action of U.S. in setting present prices ahead to July 1 will have effect of eliminating to a large degree price fluctuations.**

**Construction of shipping in U.S. yards will reach the five million ton mark during the present year.**

**Railroads may be called upon to handle shipping formerly carried in Great Lake steamers to relieve pressure there, as large numbers of vessels have been requisitioned.**

**U. S. and Japan reach agreement for taking over by U.S. of 150,000 tons of Japanese shipping. Japan made a rather keen bargain on this.**

**American fuel administration has propaganda under way urging consumers to lay in next winter's coal supply as soon as possible.**

**Big U. S. government orders for the manufacture of ordnance, shells, etc., result in keen buying of tools and equipment, with prices showing a tendency to rise in consequence.**

**Pittsburgh indicates pig iron outlook is better, basing this on the now nearly normal output of the blast furnaces.**

## A STEADY MARKET AND BRISK DEMAND

### Dealer Contends That Prices Will Work Now Toward a Lower Level

TORONTO, April 1.—April 1 brought few jokers to the iron and steel trade. The announcement, made officially a day or so ago that the present prices, as approved by United States would remain until July 1, made it certain that Canada would see little departure from the present era of high prices. In spite of this, though, dealers in many cases seem certain that the tendency is for lower prices in Canada. It is contended that the spread is too great on certain lines between United States and Canada, and that, if Canadian firms are to successfully compete with the products of American mills, which they meet in competition all the time, they must have the advantage of cheaper raw material. Any attempt to reach such a condition suddenly would mean the wrecking of many of the Canadian dealers who are stocked up now with material bought before the United States set prices on the lower grade.

Toronto dealers cannot see where the $1 reduction on basic pig iron is going to have any reflected influence on the Canadian market. It is entirely different to a sweeping change, in which case the Canadian market would be very responsive to any tendency either up or down displayed across the border. The general view is that the dollar cut was made in the interests of the smaller roller. It served a dual purpose. It answered the demand for an increase in the price of steel plates, etc., by lowering slightly the cost of basic iron and scrap, the main raw materials used in these establishments.

Old material dealers are not affected by the slight change in the American price. Business is not brisk. There is apparently no immediate prospect of a lowering of the restrictions against the exporting of scrap metals from Canada, and the buyers are not keen to load up

yards with nothing in sight to see [illegible] of the Canadian markets.

Machine tools and supplies are in good demand. Oil pumps sell practically on arrival from the factory, and there is practically no surplus stock on hand.

### Iron and Steel

The tendency of prices for steel plates, sections, etc., is going to be lower. It may not come to the surface at once, but the indications are plain enough." That is the opinion of one of the best informed men on market conditions. "The setting ahead of the time for a revision of U. S. prices until the first of July will have a tendency to keep the market steady in the meantime. We were not anticipating any radical changes, and conditions are now practically where they were prior to the 31st of March." This dealer showed a quotation of prices for the same lines of material for Canadian and U. S. factories. The Canadian prices were in many cases practically double those of U. S. "Here's one case I know of for a fact," continued CANADIAN MACHINERY'S informant. "A Brantford firm tendered on a boiler contract against the Toronto branch of a United States firm for quite a large order. There was such a difference in prices of raw material that the United States firm was able to come in against a duty of 33 1-3 per cent. and secure the business, beating the Canadian maker by quite a comfortable margin. It is that condition that is going to be a powerful factor in a movement toward a lower level of prices for the Dominion."

### Machine Tools

Canadian dealers are finding it hard at present to get orders for the larger sized chucks filled in United States. Many of the larger machines made there are required for munitions plants, and the authorities are none too anxious to have them leave the country. Permits and licenses seem to stand in the way of the larger sizes, say from 12 inches up, and on that account deliveries for these are none too good or certain. Orders are steady and prices remain as quoted, there being no list changes of any notice.

### Scrap Metals

The market for scrap materials is just where it has been for the last two weeks. It is not brisk. Dealers are none too keen to buy largely. The dollar off the American pig iron and scrap price makes little or no difference to the Canadian prices. In fact the government control of large amounts of cuttings from munitions plants, etc., has made the market such that there are no surprises, nor are there likely to be any in store. There is a very wide margin at present between pig iron and scrap metal—in fact the difference is too great. The present figures show that there is a difference now between pig and scrap of $8, while in ordinary times a spread of two dollars would be considered a fair average. Sales at a shade off the list prices are being made in some cases, the dealers claiming that the narrowed scope in which they have to sell makes it necessary for them to protect themselves to this extent.

### High Speed Steel

"Shipping is the big problem now," stated a Toronto dealer to CANADIAN MACHINERY. This man deals principally in high speed steel. "It is not such a serious matter to get orders through now as it was a year ago. At that time I know for a certainty that certain good Canadian business had to be shelved for a time in order to allow Russian war orders to be filled Of course that has been done away with, and it is not such a serious matter to get orders through the mills as it is to get the shipping accommodation to forward them. The war situation has much to do with business also. It looks to me as though it would be good policy for Canadian buyers even at present prices to buy for import now. Of course that seems a strange policy when one considers the present very high prices of carbon steel."

Another feature that may be overlooked in this is that Canadians have been buying very peculiar shapes and sizes. These are hard to get, and they are going to be harder to get later on. Munitions shops want equipment to fit many different machines. The stock on hand of high speed steel is being depleted much more rapidly than it is being renewed. This, according to our information, is true of Montreal and Toronto in particular.

There is nothing of special interest in this week's happenings on the non-ferrous metal markets. The Canadian situation seems to be gradually working into a smaller circle, due to the excess of use over the available new supplies. Prices remain steady with business demands brisk.

## PRODUCTION OF COAL IN NOVA SCOTIA MINES IS NOT UP TO EXPECTATIONS

Special to CANADIAN MACHINERY

SYDNEY, N.S., April 1.—Production of coal does not show any improvement, and it is probable that the outputs of the Nova Scotian collieries for the first quarter of 1918 are the lowest in a decade. Unfortunately, also, there are no indications of improvement, and the best that can be hoped for is a maintenance of production at the present level. There are reasons to believe that outputs will still further decline. The production of the Dominion Coal Company for the first quarter is 130.000 tons below that of the corresponding period of last year. The Acadia Coal Company's output has suffered by the idleness of the Allan shaft mine which has not yet recomemnced operations since the explosion there.

Wage questions have been adjusted at the collieries of the Dominion Coal Company, of the Acadia Coal Company, and at the Inverness Co.'s mine. The wage question is still unsettled at the mines of the Nova Scotia Steel & Coal Company, although it is understood the company has offered an increase which will make the wages of its workmen practically the same as those of the workmen of the Dominion Coal Company on the other side of the harbor of Sydney. Although no serious trouble is expected there has been an occasional [illegible] Board of Conciliation will have to be appointed to adjust the trouble.

### Higher Selling Prices

The Fuel Controller has authorized the advance of coal selling prices to several coal companies in Nova Scotia, and other advances are likely to follow. To meet the increased cost of mining occasioned by increased wages and increased prices of materials a very substantial increase in selling prices will be required, possibly an increase to a figure between six and seven dollars per short ton at the pit mouth.

Newspaper reports from Ottawa announce that arrangements have been made between the Dominion Iron & Steel Company and the Federal Government for the erection of a plate mill, but locally nothing is definitely known. If a plate mill is established at Sydney it will necessitate a large expansion in the smelting departments of the Dominion works to provide the additional steel required over and above the ordinary activities of the plant. Public interest is very keen in the possibilities of expansion, and it is generally considered that the government is to be congratulated on its evident determination that Canada shall assist, as the country is very well able to assist, in meeting the shipping emergency. While the location of a plate mill in Sydney does not necessarily signify the commencement of a shipbuilding industry here, it makes the possibility a very real one. It is to be expected that some animated bidding for shipbuilding will from now on take place between those ports in Nova Scotia which are considered to have suitable facilities for the commencement of this most essential industry.

## PUTS SPIKE IN THE YARN ABOUT FAILURE

### U. S. Building Programme Will Float 5,000,000 Tons During the Year

Special to CANADIAN MACHINERY

WASHINGTON, April 1.—All rumors concerning the partial failure of the shipping programme of the United States were spiked this week, when Chairman Edward N. Hurley of the United States Shipping Board made a definite statement of the programme which he expects to conclude.

Summarized, Chairman Hurley's statement is as follows:—Eighty-one new shipyards are now in the course of construction or completed. These will afford 235 new ways for the construction of steel vessels. The programme for steel ships now includes 8.205.708 deadweight tons during the year 1918. This includes more than 2.000,000 tons of requisitioned vessels which were near-

ing completion when the Shipping Board seized them. Of this programme there are now 28 per cent. completed. Eight per cent. were in actual service on March 1. Three hundred and thirty-two ways for wooden vessels are under construction or completed. The programme calls for a construction of 2,300,000 deadweight tons.

### The Five Million Mark

This statement from Chairman Hurley has been received with considerable gratification in Washington. It shows that the actual construction of the Shipping Board will be approximately 5,000,000 tons during the present year. This estimate is the actual work of the Shipping Board and does not include the vessels which were under construction and vessels which have been commandeered and rebuilt.

### Regulate Shipping

Because of the fact that the Shipping Board has requisitioned a large number of vessels operating upon the Great Lakes, steps have been taken by the United States Shipping Board to regulate shipping on the Great Lakes during the coming season. It will be necessary that all possible conservation of shipping space be made in order that there may be no great shortage of Great Lake tonnage. A committee of four has been appointed to control the Great Lakes shipping as far as possible, by agreement with the interested parties. This committee will have a representative of the Shipping Board, a representative of the iron ore trade, a representative of the coal trade, and a representative of the railroads. As far as possible it is hoped that the business formerly carried upon Great Lakes steamers will be diverted to the railroads. Closer co-operation between the railroads and the steamship lines is sought.

The United States Shipping Board has placed contracts for 150 motor-driven ships. After investigation it has been found that ships of this type will give more cargo space, greater efficiency, and will save man power and present a less degree of visibility.

### U.S. and Jap Bargain

An agreement has been reached between the United States and Japan for the transfer of 150,000 tons of Japanese shipping to the United States. The agreement is based upon a promise of two tons of steel plates for one deadweight ton of shipping capacity. The agreement is a temporary one, and it is understood that another agreement will supplant it later. Japan is considered to be the gainer in this agreement as it is estimated that one ton of steel plate will make about three tons of shipping. In the face of a rather stringent steel market in the United States this agreement is looked upon by American industrial men as one which is very apt to cause an even greater steel stricture than there now is. It is the purpose of the government, however, to make up the steel sent to Japan by a greater elimination of the use of steel in non-essential industries.

### A Radical Step

The Fuel Administration has under advisement now a step which will be of the most vital importance to all manufacturers securing their coal supply from the United States—this step is the revocation of all contracts for delivery from producer to consumer. If the step is taken it is expected that it will have the effect of placing the entire coal supply of the United States under the direction of the Fuel Administration. In view of the amicable arrangements last year between the Canadian government and the United States government regarding coal supply it is not expected that the proposed order will work any serious hardship upon manufacturers in Canada.

The Fuel Administration is now carrying on a propaganda during all coal consumers to lay in their supplies for the coming winter at the earliest possible moment. No hope is held out that the shortage of last year can be greatly relieved, at least as far as the transportation problem goes.

The Fuel Administration has issued an order allowing producers to charge twenty per cent. more for cleaned coal.

The production of bituminous coal in the United States fell off 579,000 tons during the week of March 16.

Bids will shortly be asked by the United States Navy upon a considerable quantity of hand and machine tools. Specifications may be secured from the Bureau of Supplies, Navy Department, Washington, by asking for schedules 1741, 1742, 1743, 1744, 1746, 1747, 1750 and 1751.

Present fixed prices on steel, ore, coke and steel products which were subject to revision are to be continued until July 1. A reduction has been ordered of $1 a ton on all scraps, both gross grades and differentials.

Reports of the Interstate Commerce Committee show that during the first month of government control, the month of January, the railroads sustained a loss. The reports show that there was a deficit of $2,227,000 in the operating incomes of 177 out of 196 railroads.

Industry in the United States has been quietened this week by substantial reports that proposed legislation fixing the prices on all staple industrial commodities has been abandoned.

## MILLIONS BEING SPENT IN EQUIPMENT

### American Orders for Fitting up War Shops Coming on Large Scale

Special to CANADIAN MACHINERY

NEW YORK, April 1—Manufacturers of ordnance, shells, shell accessories, airplanes and of other war munitions are actively buying shop equipment in the eastern markets. The War and Navy Departments also have placed orders for machine tools in the last few days. It is estimated that contracts closed have aggregated between $5,000,000 and $6,000,000 and inquiries are now in the market for both large and small tools which call for the expenditure of $10,000,000 or more. The Singer Sewing Machine Co. has purchased $600,000 worth of machine tools which will be installed in its plants where recoil mechanisms for three-inch field pieces

## REVIVAL LIKELY IN MACHINERY TRADE IN CANADA ON CONCLUSION OF THE WAR

OVER fifty years ago Robert Donaldson arrived in Montreal and started in business there. Needless to say he hailed from Scotland. He claims that he has not celebrated his eightieth birthday, and the way in which he still gets around lends quite a bit of force to his claim. He has been in Toronto for a few days visiting relatives, and also looking over a few machines. He is the senior partner in Robert Donaldson and Son of Montreal. Discussing the developments that were taking place in Montreal at present, Mr. Donaldson remarked to CANADIAN MACHINERY that the shipbuilding enterprises were giving a great growth to all lines of industry that could handle any of the many lines required in that business.

"I'd like to go into that strong myself," he said, "but the great thing that prevents rapid and substantial development is the question of help. It's out of the question to get the kind needed for the successful operation of any plant that deals with the shipbuilding lines. The situation has never been worse. We have never trained enough men for particular work. Our people seem to be satisfied to make a living and have a good time. And there it ends.

"I may be wrong, but I look to see a great revival in the machinery trade at the conclusion of the war. I don't see how Germany can start in again and make stuff at the old price. It doesn't seem possible that any country could do this and make any money out of it. And there is where the question of skilled help for Canada is going to come in again. How is this country going to develop foreign or even home markets unless she has the men to make the goods? I don't think the training the men receive who have left other lines and gone into munitions is going to do them much good. I do believe though, that you will see female labor employed to quite a considerable extent after the war. There are a number of simple operations in almost every line that can be done by women.

"There have been remarkable changes in Montreal since I first went there," concluded Mr. Donaldson, "and give us clean government and honest dealing and it would be a great city and a splendid place."

of New York that will make 6-inch

& Sons, Ltd., St. Johns, N.B., who will make 9.2-inch shells for the United

Co., New York City, are asking for bids on several hundred dollars worth of tools to be installed at factories at Buffalo and Tonawanda, N.Y., and at St. Catharines, Ont.

The Cowdrey Machine Works, Pittsburg, Mass., is in the market for shop equipment to make gun mounts. The Leyland-Gifford Co., Worcester, Mass., for

for Liberty motors. The Willys-Overland Co., Toledo, is expected soon to buy $500,000 worth of tools to be used in the manufacture of 8-inch shells. The Savage-Arms Corp., Utica, N.Y., has confirmed the purchase of several hundred tools, including milling, drilling, profiling and screw machines. The Armstrong Cork & Insulation Co., which is making 4.7-inch shells at its Lancaster, Pa., plant, has been purchasing machine tools. The Budd Manufacturing Co., Philadelphia, making aerial bombs, and the S-S-E Co., Kensington, making quadrant sights, have placed supplementary orders for shop equipment.

### Prices are Higher

The heavy demand for machinery and machine tools is again reflected in higher prices. One manufacturer of shapers has advanced prices 20 per cent., and makers of sensitive drills are asking an advance of 10 per cent.

The Ordnance Bureau of the War Department, in anticipation of ordering gun carriages in large numbers to be finished the latter part of this year and throughout 1919 has begun placing large orders for machine tools. The tools will be warehoused to be in readiness for manufacturers who are awarded the carriage contracts. One of the large warehouses now being constructed by the government will be utilized for this purpose. Negotiations for this machinery are now being actively conducted at Washington. The Navy Department is also buying machine tools for stock.

The International Motor Co., Plainfield, New Jersey, has purchased about $50,000 worth of shop equipment in the last week, and the new tools will be utilized in making motor trucks. Fred. T. Ley & Co., New York contractors, are building a munitions plant and are pre- for a large machine shop. Orders for seven hand power cranes have already been awarded. Several steel companies have been buying shop equipment in the last few days, among the purchasers being the American Sheet & Tinplate Co., the Mansfield Co., Sheet & Tinplate Co., the Canton Sheet Steel Co., and the Brier Hill Steel Co.

The Marlin-Rockwell Co., New Haven, manufacturers of machine guns, radiators and bearings, has leased the New York plant of the Murray & Hill Co. with the privilege of purchase; the consideration is reported to be $500,000. Radiators will be manufactured exclusively at the New York plant. The American Condenser & Engineering Co. is buying 75 to 80 tools for a new factory and bids are now being taken on lathes, boring mills, air compressors and motors for operating travelling cranes.

## PIG IRON OUTPUT NEARS NORMAL MARK

### Figures of Pittsburg Blast Furnaces Show an Increased Production

Special to CANADIAN MACHINERY

PITTSBURG, Pa., April 1.—By announcement at Washington late Tuesday night the iron and steel price schedule is carried for another three months, to June 30, the only revision being that basic pig iron is reduced $1 a ton to $32 at furnace, this carrying with it a reduction in Bessemer to $35.20, to maintain Bessemer at 10 per cent. above basic, and all grades of scrap on which prices have heretofore been set are reduced $1 a ton.

The steel manufacturers generally desired the set prices for steel to be continued. There were very few who were disposed to urge any advances and still fewer who thought it at all possible that plates, the only commodity about which there was any real discussion, would actually be advanced. The manufacturers desired that prices be continued to the end of the year, but it seems they later offered to be satisfied with a continuance for six months. They were in a somewhat awkward position in this matter, however, seeing that, to preserve the existing schedule, they had argued that costs had been advancing, and the argument of advancing costs did not altogether harmonize with the plea that prices should be fixed for a long period.

### The Probable Effect

Now that the price matter is settled it remains to be seen whether the new situation will result in either buyers or sellers taking more interest in the market. There was no distinct evidence that buyers were holding off by reason of uncertainty as to prices, and indeed if they had bought they would have been fully protected against a decline by the government clause. As to sellers, now that they are assured they will not be compelled to accept lower prices on second quarter deliveries they may be more ready to sell.

The market is still, up to date, a tight one from the viewpoint of the buyer. It is very difficult for him to place orders. That is probably a reflection more of the shipping situation than it is of the volume of business on the books of the mills. Nominally the mills have a very large volume of business on books, between 12,000,000 and 15,000,000 tons, exclusive of government orders. The question is how much of this is live business, how much of the business the buyers would actually be willing to accept shipments against. As long as it is so difficult to make shipments on account of traffic congestion it is impossible to have this matter tried out, and apparently the mills simply proceed on the assumption that the business is all live, and none needs to be written off. A period of a few weeks of really free shipments might put an entirely different aspect on the matter. The whole question is an involved one, for even the usual distinction cannot be made between contract tonnage that is not specified and contract tonnage that is, for the reason that the mills have a large volume of specifications unfilled that was received months ago, and they do not know that buyers would be willing to receive all this steel according to the specifications. Their requirements might have changed very materially even if they had not decreased as in most cases doubtless they have.

### Pig Iron

There ought to be a freer supply of pig iron by this time, as blast furnace operations have been increasing more or less steadily and are now not far from normal. Production is between 85 and 90 per cent. of capacity, whereas late in January and early in February it was below 60 per cent., if not below 50 per cent. For three successive weeks Connellsville coke shipments have run at about 334,000 net tons a week, against less than 300,000 tons shipped in any preceding week of the year. A fair estimate seems to be that full requirements of the furnaces depending on the Connellsville coke region are about 375,000 tons weekly, but they may possibly be somewhat less. In any event there remains some deficiency in beehive coke, but the by-product coke plants have lately been receiving practically full shipments of coal so that the blast furnaces depending on by-product ovens are practically fully supplied with coke. It is a fact that pig iron is accumulating, but in the case of the merchant furnaces the accumulation is attributed—by the furnaces—to lack of shipping facilities, while in the case of the steel interests it is asserted that any accumulation merely operates to restore in small measure the stocks the steel works normally carry, but which were completely used up last year. It will be strange indeed if pig iron is not easier to buy in the near future.

With the reduction of $1 a ton in basic iron ordered by the government and the attendant reduction in Bessemer to keep it 10 per cent. above basic, the new schedule of prices ruling on all deliveries April 1 and later, except on contracts made prior to January 1 is as follows, f.o.b. furnace irrespective of location: Bessemer, $35.20; basic, $32; No. 2 foundry, $33; malleable, $33.50; gray forge, $32. Leaving malleable at $33.50 can hardly be called anything but an oversight, for it should stand in relation to basic. Most of the malleable sold lately has been, generically, simply off basic.

### Government Buying

Word comes that the government's

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## ENGINEERING

East Broughton, Que.—The Quebec Asbestos Co. propose to expend about $30,000 for power plant and development, etc.

**Toronto, Ont.**—Canadian Allis-Chalmers, Ltd., will erect a $6,000 steel and galvanized iron addition to smith shop at Lansdowne Ave.

**Bridgewater, N.S.**—The Davison Lumber Co. contemplate the erection of a sulphite pulp mill, planing mill and box factory. Acting manager, A. F. Pamenter.

**New Westminster, B.C.**—It is reported here that the C. N. R. shops at Port Mann will be in operation soon, also that a wing dam on the north jetty will be constructed.

**Cobalt, Ont.**—The Spruce Falls Pulp and Paper Co. propose to erect a pulp mill at once to cost $1,000,000. Elihu Stewart, managing director, Canada Timber and Lands, Ltd., Toronto, Ont.

**Huntsville, Ont.**—The Bethune Pulp and Lumber Co. will erect a saw mill with a cutting capacity of 40,000 feet per diem on Vernon Lake. A rossing plant also will be installed. Chas. Dinsmore, manager; head office, Toronto.

**Moncton, N.B.** — Company is being formed at present but it is contemplated to commence construction of development otthe Tungsten Mine at Burnt Hill, N.B., about May 1. Concentrating mill, etc., to cost about $150,000. Address Mr. Matthew Lodge, 274 Union St., Moncton.

**Niagara Falls, Ont.**—A deposit of coal has been found by the engineers of the Hydro constructing the Chippewa-Queenston Hydro Power Canal. Excavations of 170 feet are necessary to construct the canal, and on Saturday the coal deposit was struck at a depth of about 150 feet, near the Whirlpool. The coal is of rough variety, being what is known as rock coal, but it is burnable, and if there are any quantities of it there this may prove a rich find for the Hydro and the province generally.

**Montreal, Que.**—W. C. Hawkins, president of the Southern Canada Power Co. was in the city recently in conference with the other officials and engineers of the company in connection with the completion of the plans for the company's hydro-electric development at Drummondville, Que. This development will have an ultimate capacity of 17,000 to 20,000 h.p., but the electrical equipment to be installed now will be about 10,000 h.p., the remaining equipment to be installed as the demand warrants. The installation will be completed within a year or 15 months.

## GENERAL

**London, Ont.**—The London & Petrolea Barrel Co. contemplate building an addition to their factory.

**Nelson, B.C.**—A company has recently been formed for the purpose of building a cordage factory near the Pacific Coast. About $250,000 is to be spent on the plant, and it will probably be located at Nelson.

**Rawdon, Que.**—The Miner Lumber Co. lost its big mills here last Sunday by fire, that did $50,000 damage. The head office of the company is in Montreal. Thousands of feet of lumber were destroyed also.

**Alliston, Ont.**—D. M. Gilpin and Roy Wakefield, vice-president and secretary respectively of the Veterinary Specialty Co., spent a couple of days of last week in town. It is understood that the company proposes establishing a factory here.

**Toronto, Ont.**—The Jefferson Glass Factory at 388 Carlaw Avenue was totally destroyed by fire early on Monday morning. The loss is estimated by General Manager W. A. Martin at $30,000, divided about equally between the contents and the building. The building was owned by the company and the loss is covered by insurance.

## BUILDING

**Toronto, Ont.**—City Architect Pearse has issued a permit to the Imperial Oil Co. to erect a bulk storage station for petroleum products on the south side of Keating street, at a cost of $104,200.

**Toronto, Ont.**—The City Architect issued a building permit to the Imperial Munitions Board for the erection of a stores depot on the west side of Weston Road, near St. Clair Avenue, at an estimated cost of $125,000. The Royal Flying Corps, it is understood, require the building.

## MUNICIPAL

**Woodstock, Ont.**—Council are in the market for prices on 500 feet of fire hose at once.

**Alliston, Ont.**—The Town Council have decided to install a triplex plunger pump at the waterworks plant.

**Brantford, Ont.**—A fixed assessment of $100,000 per year for a ten-year term has been granted the Dominion Steel Products.

**Summerland, B.C.**—The City Council have decided to purchase a 6-inch centrifugal pump for the Trout Creek Point pumping station.

**Strathroy, Ont.**—By-law has been passed appropriating $5,000 for the purchase of a motor-driven turbine pump to be installed in waterworks system for fire protection.

**Mimico, Ont.**—The council is considering the purchase of fire apparatus, and an American company will be given an opportunity to demonstrate their equipin the near future.

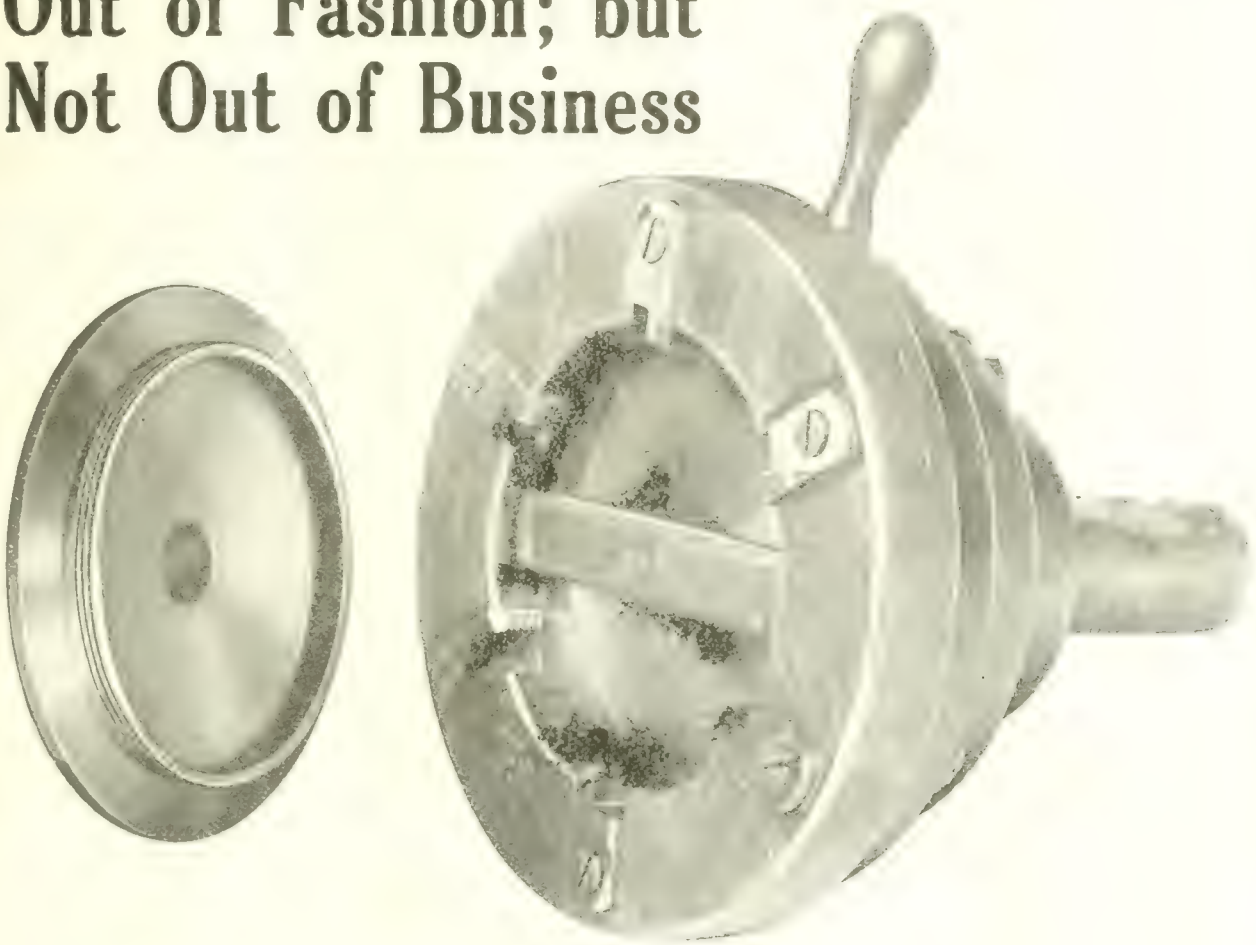
**Brantford, Ont.**—The depleting of the Onondaga gas field to the south of Brantford is shown by the announcement that the Standard Gas Co., which had a charter for operating in this field, will apply on April 15 to have its charter cancelled. The playing out of this field cut off the supply of pure gas to this city.

**Chatham, Ont.**—Use of chemicals in increased quantities in the treatment of the civic water supply is recommended in a letter received by the water board from Engineer Willis Chipman, of Toronto, following an investigation made into local conditions recently. It is stated that the quantity of sulphate of alumina could safely be doubled and an increase of 25 per cent. made in hypochlorite. Tests of the city water show that it contains bacteria of intestinal origin.

**Toronto, Ont.**—Reclamation work involving an expenditure of $1,732,000 according to the gross estimates which have been approved for the year will be undertaken by the Board of Harbor Commissioners of Toronto this summer. So far as is known at present no work will be done over at the Island, and the entire activities this summer will be in reclamation work in the industrial area east of Cherry street and along the water front from Bathurst street east, according to the officials of the commission. The commission is at present engaged in rebuilding the passenger sheds of the Toronto Ferry Co., which were burned this winter.

**Windsor, Ont.**—Ratepayers of Windsor Walkerville, Ford, Sandwich and Ojibway have decided by an overwhelming vote in favor of the proposed new trunk sewer connecting the municipalities, thus doing away with water pollution. The vote stood 1,332 for and 183 against, and provides for an expenditure by the municipalities of $210,300 for the construction of an intercepting sewer which will carry out all sewage below the waterworks intakes. Of the total amount Windsor's proportion of the cost will be $26,200; Sandwich West, $28,333.33; Sandwich Town, $25,333.34; Ford, $65,300, and Ojibway, $46,533.44. The sewer will be in two sections, the easterly portion extending from the town of Ford to Parent Avenue, in Windsor, emptying below the Windsor waterworks intake. The other section will serve Ojibway, Sandwich and Sandwich West.

# Out of Fashion; but Not Out of Business



This old "war horse" of a Geometric Die Head has been cutting Screw Threads for a Chicago concern for seventeen years. It was recently sent back to the Geometric Factory for overhauling, and has gone again to Chicago, for possibly seventeen years more of duty.

A Geometric Collapsing Tap, purchased by the same people seventeen years ago, is still cutting the inside threads to match. Can you match that?

Geometric Thread Cutting Tools of to-day can surpass it. What thread cutting method are you using? Learn the Geometric way. It is a path others have trod for the past twenty-five years. Geometric experience has smoothed the path of thread cutting for many. What will you let it do for you?

*We could help you—let us.*

## THE GEOMETRIC TOOL COMPANY

NEW HAVEN, CONNECTICUT, U.S.A.

*Canadian Agents:* WILLIAMS & WILSON, LIMITED, MONTREAL. THE A. R. WILLIAMS MACHINERY COMPANY, LIMITED, TORONTO, WINNIPEG AND ST. JOHN, N.B.

# TRADE GOSSIP

McKinnon, Holmes & Co., of Sherbrooke, Que., have opened a sales office at 304 New Birks Building, Montreal, Que. W. J. Lockhead is in charge.

**St. John's, Nfld.**—The steamer Erik has arrived here with twenty-four thousand seals. An agreement will be probably made between the crews and owners of all the sealing steamers for the purchase of seals at $12 per hundredweight for young and $9 for old seals.

**The Canadian Car & Foundry, Co.,** Montreal, has bought out the interests of the Standard Steel Co. in Montreal. The plant of the latter has been in operation on munitions steel for the past two years, and under the new management will continue on this class of work for the Imperial Munitions Board.

**Order for Canadian Locomotive Co.**—The Canadian Locomotive Co., Kingston, has received a contract for 70 locomotives from the Dominion Government for the government railways. The approximate cost of each locomotive is $60,000, which makes the contract worth about $4,200,000.

**Montreal Locomotive Gets Large Order.**—The Montreal Locomotive Works, the Canadian branch of the American Locomotive Co., has received an order for 80 locomotives from the Canadian Government Railways. The locomotives will have an approximate value of $60,000, so that the total order will aggregate some $4,800,000.

**Big Steel Plant at Sydney, N.S.**—The Dominion Government has made arrangements with the Dominion Steel Corporation for the installation of a plate mill at Sydney, N.S. The mill will cost between $3,000,000 and $5,000,000, and will be capable of producing 150,000 tons of ship plates annually. It is hoped to have the mill in operation by the autumn of 1919.

**The Holmes Electric Protection Co.** is installing its system consisting of Combination Fire Alarm and Watchman's Signal Boxes in the warehouse and storerooms of the Toronto Hydro-Electric System, 27-29-31 St. Patrick Street. Fire Alarm Boxes have also been installed at the plants of Woods Mfg. Co., Logan Avenue, and Phillips Mfg Co., Carlaw Avenue, Toronto.

**Drop in Rubber Shipments.**—Shipments of crude rubber from Para and Manaos, Brazil, in December fell heavily from the total for the corresponding month a year previously. The total for these two ports, the only South American ports shipping in December, was 3,129,438 pounds, against 9,224,671 pounds for the same month in 1916. There were no shipments to Europe last December.

**Cast Iron Pipe Wanted.**—A London, England, dealer in iron and steel products and cast iron pipes of all kinds asks to be put into touch immediately with Canadian manufacturers of cast iron rainwater and soil pipes. For specifications and illustrations see pages 484-485 of March 25 issue of the "Weekly Bulletin," published by the Department of Trade and Commerce, Ottawa.

**Welland Canal May Open Early.**—Because the ice is moving so satisfactorily it is expected that navigation through the Welland Canal will be opened earlier than usual this year, and this is the desire of the Government. Lock tenders all along the canal have been instructed to be ready to go on duty soon. The ice has left the canal, and it is hoped that conditions at Port Colbourne harbor will allow an early start. The opening is April 15. A large number of boats taken over by the Government for Atlantic service to carry supplies to the allied armies, it is understood, are waiting to be rushed through.

**Tender for Power Plant Equipment.**—Tenders for the following equipment for the Water Supply Department, Queensland, Australia, will be received until July 15, 1918:—1. Supply, delivery and erection of complete boiler-house equipment for an electric power-house in connection with the Inkerman irrigation area, near Townsville, North Queensland. 2. Supply, delivery and erection of steam-driven turbo-alternators to be installed for the Inkerman irrigation area, near Townsville, North Queensland. Tenders to be addressed to the Under Secretary, the Treasury, Brisbane, Queensland.

**Will Not Take Lake Steamers.**—It is announced that the five steamers of the Great Lakes Transit Co. will not be taken from the lakes by the U.S. Shipping Board. The steamers are the Milwaukee, Chicago, Utica, Cook and Underwood. When it was first learned that the Shipping Board was making inquiries relative to commandeering these five ships several big shippers and other business interests along the Great Lakes called the attention of the Government officials to the great need for the boats on the lakes, and declared that lake shipping would suffer materially if the boats were taken out of service on the fresh water bodies.

**Launching in U.S. in March.**—A despatch from Washington, states that the United States Shipping Board exceeded its launching programme in March by 52,000 tons, but fell behind in its schedule of completed ships, owing to difficulty in obtaining steel plates. Figures given out at the Board's office Saturday showed that 36 ships of 272,786 tons were launched and 20 of 162,200 tons were completed and delivered. At the beginning of the month it was announced that it was hoped to launch 35 ships of 220,591 tons during March and to deliver 23 ships of 188,275 tons.

**Cannot Locate Henry Cort Wreck.**—Efforth to locate the sunken wreck of the whaleback steamer Henry Cort have been unsuccessful. The Cort sank Dec. 12, after being rammed by the Midvale while working as an ice-breaker to help the lake fleet down the lakes. The Lake Carriers' Association desires to mark the wreck for the protection of other vessels. President William Livingstone has announced that $250 will be paid for information by which the wreck is found. Ice during the winter carried away the whaleback's stack and upper works. She sank between five and six miles below Bar Point light.

**Navigation Examinations Held at Kingston.**—The examinations at the School of Navigation in connection with Queen's University were held under Capt. H. King, Toronto supervising examiner for inland waters. The following candidates were successful:—Matthew Augustus McDonald, miner tub-boat master and miner passenger steamer mate; William Vincent Smith, Kingston, freight steamer mate; Jos. Menard, Kingston, passenger steamer master. Capt. H. M. McMaster, of the Montreal Transportation Co., is in charge of the school, carrying on good work for the Marine Service, and is on a most successful basis.

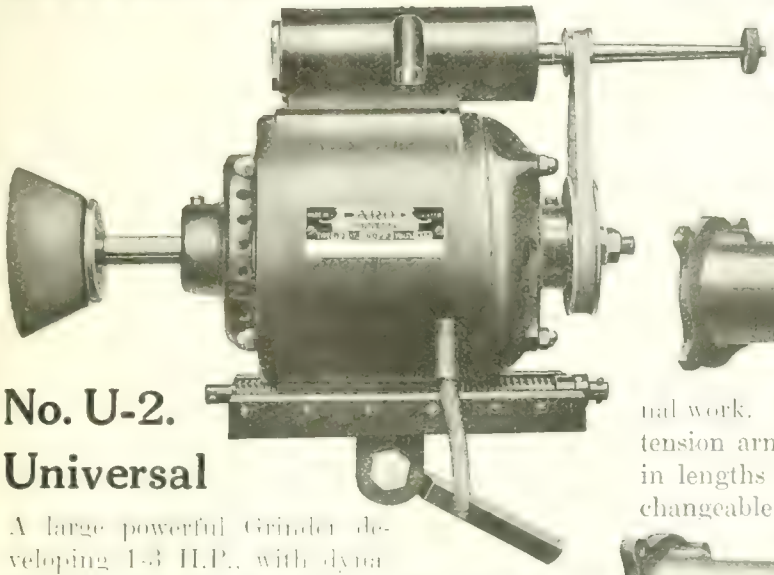
**Algoma Steel Corporation Developments.**—The Algoma Steel Corporation has just installed its fourth blast furnace with a capacity of 500 tons of pig iron per day, according to information obtained from an official of the company. The company's output of steel ingots per month ranges from 43,000 to 45,000 tons, and when the coke ovens, which are at present under construction and are expected to be completed some time in June, are in commission the monthly output is expected to rise to 50,000 tons. Business is confined solely to shell steel, and orders on the books are sufficient to keep the company busy for a long time to come.

**Nova Scotia Steel Fills Vacancy on Board.**—At the annual meeting of shareholders of the Nova Scotia Steel & Coal Co. at New Glasgow, N.S., the number of the board was increased to sixteen, and there was one vacancy to fill, through the death of Hon. Jas. D. MacGregor, vice-president and charter member of the directorate. That vacancy was filled by the appointment of Hon. Robert M. MacGregor, only son of the deceased, while the two newly-created positions were filled by the appointment of D. C. Jackling, New York, and W. Hinkley Smith, Philadelphia. All the old members were re-elected with the exception of A. S. Rendall, of St. John's, Nfld.

**New Statistics Bureau at Ottawa.**—Hon. C. J. Doherty has given notice of a resolution providing for the creation by the Minister of Trade and Commerce of a Dominion Bureau of Statistics to be called the Dominion Bureau of Statistics, to collect and compile all statistical information relative to the commercial, social, economic and general activities and conditions of the people of Canada. Provision is also made for the appointment of an officer to be called the Dominion Statistician to have control over the new bureau, which will collaborate with all Government departments in the compilation and publication of statistical records of administration and at intervals take the census of Canada.

**Prices Maintained on Steel Products.**—Prices on ore, coke, steel, and steel products recommended previously by the Price Fixing Committee of the War Industries Board, Washington, subject to revision on April 1, were ordered by President Wilson to-day to be continued in effect until July 1. From April 1 to

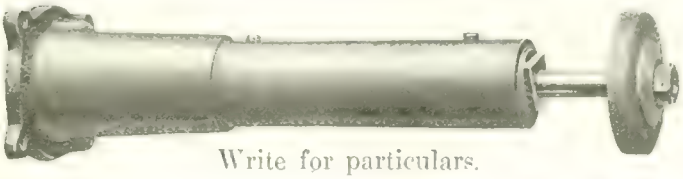
# Aikenhead's Portable Electric "Aro" Grinders



As seen in cut fitted with "A" Arm for small internal work. For large internal grinding we supply extension arms which attach direct to armature shaft, in lengths 5", 10", 15" and 20" long. All are interchangeable.

**No. U-2. Universal**

A large powerful Grinder developing 1-3 H.P., with dynamically balanced armature. This insures smooth running and accurate work. The Armature speed is 10,000 R.P.M. "A" Arm speed 30,000 R.P.M.



Write for particulars.

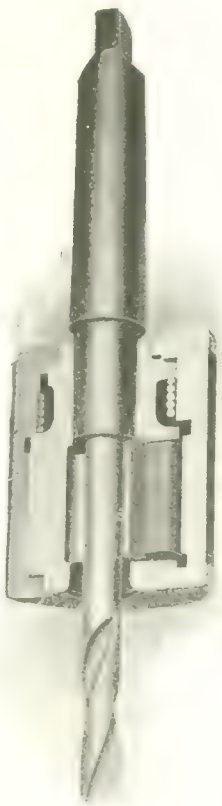
on piece work left a certain plant to do similar work in another, which paid slightly more per piece. We can't say how much money he lost through the change, because we do not know how long it took him to persuade the superintendent to order one



Aikenhead's

## Wahlstrom Automatic Chuck

But we know that shortly after the first order for one *a second order for 11 Wahlstrom Chucks was placed.*

The Wahlstrom enables operators to make tool changes in less than two seconds without stopping spindle of machines. It perfectly self-centers the tool automatically. It is a production-booster, a time-saver, a money-maker.

*Write quickly for Wahlstrom Booklet. It will be sent you.*

**AIKENHEAD HARDWARE LIMITED**

17, 19, 21 Temperance Street - Toronto, Canada

[illegible] the maximum price of [illegible] was ordered reduced from [illegible] per gross ton, and of scrap steel from $30 to $29 per gross ton. It is provided that new contracts calling for delivery of these products on or after July 1 are not to specify a price except with the understanding that it is subject to revision by any authorized Government agency. The announcement was made after approval by the President of a recommendation made to him by the Price Fixing Committee, and all manufacturers and producers are expected to observe the maximum prices.

**Lyall Construction Co. Gets American Contract.**—It is reported that the Lyall Construction Co. of Montreal is installing new machinery for the purpose of manufacturing a new size or type of shell. It is learned that the rumor is based on the arrangement being made by the company to turn out for the American Government the 4.7-inch shell, this being a new size, so far as Canadian plants are concerned. The machinery has now all been installed and the manufacture of the shells is beginning. This size takes the place in many respects of the 4.5-inch shell which the company was manufacturing for the British Government. It is understood that no great difficulty was experienced in securing the machinery in Canada. This American contract will take about six months to fill. The company is still working on 6-inch shells for the British Government, and the orders on hand are of sufficient magnitude to keep the plant operating for some months to come. The output of the factory is being well maintained and the statement is made that shipments are larger than ever.

## TENDERS

**Halifax, N.S.**—Tenders are being received by the City Council, until April 18 for the supply of 2,000 feet of 2½-inch fire hose, with couplings.

**Toronto, Ont.**—Tenders are being received until April 16th for construction and delivery of air chambers and cast iron special castings, feed water heater for main and high-level pumping stations for the Board of Control. Specifications, etc., at waterworks department.

**Toronto, Ont.**—Tenders will be received by the chairman, Board of Control, City Hall, up to Tuesday, April 23, 1918, for supply and delivery of special track work for Bloor Street viaduct. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

**Ottawa, Ont.**—Tenders for tungsten lamps, Departmental Buildings, Ottawa, Ont., will be received until Monday, April 15, 1918. Specifications and forms of tender can be obtained at the offices of the Chief Architect, Department of Public Works, Ottawa; the Clerk of Works, Postal Station "F," Toronto, and the Overseer of Dominion Buildings, Central Post Office, Montreal.

**Ottawa, Ont.**—Tenders will be received until April 11, 1918, for the electric wire and cable required in the reconstruction of the Parliament Buildings. Deliveries to commence by July 1, 1918, and to continue as directed in such quantities as to ensure complete delivery by August 31, 1918. The schedule of materials, specification and other information required can be obtained at the office of P. Lyall & Sons Construction Co., Ottawa.

**Ottawa, Ont.**—Tenders are being received by the secretary, R. C. Desrochers, Ottawa, until 4 p.m., April 15, for 12 knots of single conductor telegraph cable. Delivery Halifax, N.S., within eight weeks after order. Also for five knots on several reels for Vancouver, B.C. Earliest date of delivery. Specifications, etc., with the General Superintendent, Telephone Service, Ottawa.

**Melbourne, Australia.**—Tenders for the following may be addressed to the Director of Navy Contracts, Navy Office, Melbourne: Supply, delivery and erection at Garden Island of one 200 horse-power prime mover set of either semi-Diesel type or other heavy oil engine direct coupled to 2-65 K.W. 240 volt D.C. electric generating set. All accessories, tank and fittings to be supplied by tenders as per specification. Date of closing, June 7, 1918. Tender forms are open for inspection at the Department of Trade and Commerce, Ottawa. File No. 20,117.

**Ottawa, Ont.**—Tenders will be received until April 11, 1918, for the supply of reinforcing steel required in the reconstruction of the Parliament Buildings. All tenders shall be based on the supplying and delivering to the site of the central heating plant at Cliff Street of the quantities of the schedule of material for reinforcing steel (140 tons, more or less) in strict conformity with the specification and the samples submitted, and to the satisfaction of the architect. The schedule of materials, specifications, and any other information required can be obtained at the office of the general contractor, P. Lyall & Sons Construction Co., Ottawa.

**Ottawa, Ont.**—Tenders will be received until April 11, 1918, for the switchboards, panel boards and transformers required in the construction of the Parliament Buildings. All tenders to be based on the execution, completion, and delivery on the site, together with the furnishing of all material, tools, appliances, labor, etc., for the work as required and described by the plans and specifications for switchboards, panel boards and transformers. Plans and specifications and any other information required can be obtained at the office of the general contractor, P. Lyall & Sons Construction Co., Ottawa.

**Ottawa, Ont.**—Tenders will be received until April 11, 1918, for the steam boiler and stoker equipment required for the central heating plant of the Parliament Buildings. All tenders shall be based on the supplying and erecting of four water tube boilers, each having a rated capacity of 500 horse-power, together with fittings and soot blowers. Each tender shall give separate quotations for supplying and erecting in connection with these boilers four automatic stokers. Prices are to be based on the complete erection ready for operation of this equipment by October 1, 1918. Plans, specifications and any other information required can be obtained at the office of the general contractor, P. Lyall & Sons Construction Co., Ottawa.

**Ottawa, Ont.**—Tenders will be received by Alexander Johnston, Deputy Minister of Marine, until April 8, 1918, for the purchase of the steel twin screw suction and hopper dredge Galveston, now lying at Sorel, P.Q. Persons desiring to inspect the dredge should apply to the superintendent of the shipyard at Sorel. Length, 233 ft. x 39 ft. x 15-6 depth of hold; gross tonnage, 1,332; net tonnage, 838; draft loaded, 14 ft. 9 in. aft and 13 ft. 1 in. forward; dead weight, 1,800 tons; two suction pumps, Dutch type; working capacity, 1,350 cu. yds. in 45 minutes; hopper capacity, 1,500 cu. yds.; engines, 15 x 24 x 39 x 34-inch stroke; propellers solid, 4-bladed, 8 ft. 4 in. dia. x 10 ft. pitch; two Scotch boilers, 13 ft. 9 in. dia. x 11 ft. long x 180 lbs. W. pressure. Built in Germany in 1904. The dredge will be sold as it now stands, and no additional equipment or apparel will be supplied by the department.

**Toronto, Ont.**—Tenders will be received up to Tuesday, April 6, 1918, for supply and delivery of: No. 34 (Recall)—One 5-million Imperial gallon centrifugal pump, at the Riverdale Pumping Station. No. 37—Coal crusher. No. 38—Basic sulphate of alumina. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall.

**Ottawa, Ont.**—Tenders will be received until April 15, 1918, for 12 knots of single conductor submarine telegraph cable (107 lbs. copper and 150 lbs. guttapercha per knot) with sheathing of 12 No. 8 S.W.G. iron wires, to be delivered at Halifax, N.S., within eight weeks after order if one is given. Also for five knots same as above on several reels for distribution to be delivered at Vancouver, B.C. Earliest date of delivery desirable. Specification and forms of tender can be obtained on application to the General Superintendent of the Government Telegraph Service, at the Department of Public Works, Ottawa.

## PERSONAL

**W. W. Butler,** vice-president and managing director of the Canadian Car & Foundry Co., left last week for New York and Washington, en route for the southern states. Mr. Butler is convalescing from a recent illness, and has been advised to spend some time in the south.

**Lt.-Col. C. N. Monsarrat,** chief engineer of the Quebec Bridge, has been retained by the Dominion Government to assist the Minister of Railways and Canals in certain work in connection with the completion of the Quebec Bridge. Col. Monsarrat will have his headquarters in Ottawa and the work will occupy him for about twelve months.

**Frederick Field,** engineer superinten-

dent of the city filtration plant, has written to the Montreal Board of Control asking for indefinite leave of absence so that his services may be available for the United States Government. In his letter he says that he has received a request from the chief engineer of the Housing Department of the U.S. Shipping Board to accept a position in Washington.

## MARINE

**Port Stanley, Ont.**—The public works estimates include $77,000 for harbor improvements here.

**Port Arthur, Ont.**—Shipping men look for the opening of navigation between April 18 and 25.

**Sarnia, Ont.**—Millions of tons of lake ice is floating into the St. Clair River from Lake Huron. Southerly winds prevail, and the ice is drifting northward on the lake.

**Vancouver, B.C.**—The British-American Shipbuilding Co. propose to establish a shipbuilding plant here and have reached an agreement with the Harbor Board in regard to a site on the Kitsilano Indian Reserve.

**Vancouver, B.C.**—The Standard Shipbuilding Co., which has recently received a contract for the construction of ten steamers for the Imperial Munitions Board, will erect a plant at Ruskin, on the Frazer River.

**Owen Sound, Ont.**—The statement from Owen Sound that the Northern Navigation Co. had abandoned its service there for the coming summer is denied by officials of the Canada Steamship Lines at Sarnia, which owns the N. N. Co. The local officials state that the Georgian Bay routes will be covered by the company's boats as usual.

**Halifax, N.S.**—Three steamers, two Dutch and one Russian, have been seized by the naval authorities here and will before long be engaged in the British merchant marine. The Dutch steamers, which are about 2,000 tons net each, have been in Bedford Basin for some time, while the Russian steamer was towed into this port minus a propeller blade.

**Collingwood, Ont.**—The Collingwood Shipbuilding Co. has launched another steel trawler, making five of this type built here. Two others were launched during the winter and are now well on toward completion. All three will be ready to leave on the opening of navigation. The vessels are all alike in design and construction, a standard plan being followed.

**Liverpool, N.S.**—There was launched recently at the shipyard of the Nova Scotia Shipbuilding & Transportation Co. a 400-ton tern schooner named "Abemama," built under contract for Messrs. Peter Yee Wing & Co., of Sydney, Australia. This vessel is the second of this size launched from that yard within eight months. The name is given in honor of the island where this Australian firm is trading.

**Amherstburg, Ont.**—Efforts of Capt. Fred J. Trotter have been successful in raising the Canadian lightship Falken, which was sunk by ice last winter while lying at Scudder's dock on the north side of Pelee Island. Captain Trotter will take the vessel to Detroit for repairs before going to her station at south-east shoal, Lake Erie. The Falken is now at this port.

## RAILWAYS

**Toronto, Ont.**—Tenders for the completion of the interior work at the new Union Station were opened last week. Although the contracts call for the completion of the work by December 31, it is not likely this will be done under the present conditions, and the summer of 1919 is the most probable date for the opening of the offices.

**Montreal, Que.**—On August 1 next passenger traffic service is expected to begin through the Canadian Northern Mount Royal Tunnel. This is the expectation of the engineers now engaged on the work, and the statement is based upon the amount of the work already completed. The cleaning up of the yards is all that remains to be finished, and gangs of men are working hard on this job, doing everything possible to enable the first passenger train to pass under the mountain in five months' time.

**Montreal, Que.**—After years of intermittent negotiation, the Montreal and Southern Counties Railway has come to an agreement with the Montreal Tramways Co., by which the latter will allow the former to construct a loop line around their terminal station at Montreal, using Grey Nun, Youville and Common Streets. Work will be started early in the spring. Plans have also been prepared for the erection of a new station, freight, express and general offices on Youville Street. The station will be three storeys in height and will be built of steel, concrete and pressed brick.

## CONTRACTS

**Regina, Sask.** — The Otis-Fensom Elevator Co. has the contract for elevator for $395,000 warehouse for the T. Eaton Co., Ltd.

**Windsor, Ont.**—The Board of Control has awarded contracts for sludge pumps, motors, etc., for the sewage disposal works to Noble & Rich.

**Toronto, Ont.**—The A. B. Ormsby Co. have been awarded contracts for steel sash, tin-clad doors, skylights, etc., for the Bond Engineering Co's. new foundry at Ashbridge's Bay industrial district.

## WOODWORKING

**Sarnia, Ont.**—The Cleveland-Sarnia sawmills, which have been closed since the early part of the winter, have reopened for the season.

## INCORPORATIONS

The Pioneer Collapsible Tubes, Ltd., has been incorporated to manufacture, buy, sell and deal in goods, wares and merchandise of all kinds. The capital stock is $50,000. and the incorporators A. T. Bonathan, C. W. Toms, H. L. Crossland, C. Rimmer, and W. B. Shepherd.

# CATALOGUES

**Cochrane Multiport Valves**, a new bulletin issued by the Harrison Safety Boiler Works, Philadelphia, Pa., contains information covering the principal features of the Cochrane multiport valves. Copies may be obtained on application from the exclusive Canadian agents, Canadian Allis-Chalmers, Ltd., Toronto.

**The Smooth-On Mfg. Co.**, Jersey City, N.J., have issued a sixteen-page circular containing extracts from Smooth-On instruction book No. 16. One particular feature of this circular is that it contains the standard sizes of Smooth-On coated corrugated gaskets for flanged pipes from 2-inch up to 26-inch. Copies of the booklet will be gladly sent on application.

**Power-Driven Air Compressors.**—The Canadian Ingersoll-Rand Co., Ltd., Montreal, has issued recently bulletin K-301-A, describing two-stage, power-driven air compressors, of the duplex type, "PLB-2." This is a 16-page 6 x 9 pamphlet outlining notable features of construction, such as the "Circo" leaf valves, Haight 100 per cent. belt wheel joint, bath lubrication system, dust-proof frames and casings, etc., as well as the marked compactness of the design, yet easy accessibility of all parts.

**The Darling Digest** is the title of a new house organ to be issued monthly by Darling Bros., Ltd., Montreal. The first March edition has been distributed. It is the intention of the company to make the publication interesting, helpful and instructive, and to give each month information of a reliable nature regarding their products and doings and to bring their customers and friends into closer personal touch with the organization. The bulletin will also from time to time contain interesting technical talks on the manipulation of heating systems, steam specialties, pumps and products generally.

# BOOK REVIEWS

**Comparative Tests of Six Sizes of Illinois Coal on a Milkado Locomotive.**—Bulletin No. 101 contains data covering a series of tests to determine the value of different sizes of coal as conducted by the Engineering Experiment Station of the University of Illinois under a co-operative agreement with the International Railway Fuel Association and the U.S. Bureau of Mines. A Mikado locomotive weighing 142 tons belonging to the B. & O. R. R. was used, the tests being made in the locomotive laboratory at Urbana. The results are published in above bulletin No. 101 by E. C. Schmidt, J. M. Snodgrass, and O. S. Beyer, Jr. Copies may be had without charge by addressing the Engineering Experiment Station, Urbana, Illinois.

THE safe load on belts per square inch of section, according to different writers, ranges from 290 to 500 lbs. per square inch.—Belts.

## DEVELOPING THE FUTURE TRADE OF CANADA

(Continued from page 363.)

ber of idle men will increase. When the jolt comes it will not be the men from the farms who will be walking the streets looking for work. They will still be enjoying an era of high prices for farm produce. To my mind it is not feasible to develop foreign trade in an atmosphere that it discourages it at home.

### About Standardization

Mr. Parsons is apparently convinced that, with other conditions being favorable, it is possible for Canadian manufacturers to work in groups to develop foreign trade. "We want one strong committee to go into this work. A few live men around a table could do a lot to bring some real organization into existence. We want to avoid a multiplicity of committees and a cumbersome organization or an approach to the Irishman's horse that was all harness."

CANADIAN MACHINERY here inquired if working in groups would involve standardization of farm implements or supplies, which might not be an agreeable proposition to the manufacturers.

"That's a big question," concluded Mr. Parsons, "and one in which there is room for a lot of discussion. I believe there are some shops which, from their location and equipment, can do certain work to much better advantage than others, and it would be well to make use of this fact. But I am in serious doubt as to the advisability of standardizing implements throughout. Don't you think it would lead to stagnation? The present system, defective as it is in some ways, but also capable of correction, is a constant stimulus to invention and improvement. Remove that and I am afraid we would soon drift into that poor state of letting well enough alone."

Mr. Parsons, in concluding, stated that he believed the first step in after-war trade would be the appointment of a Trade and Tariff Board, and he was certain this should be proceeded with at once.

## PITTSBURG MARKET LETTER

(Continued from page 368.)

shell steel buying program for second half is enlarged. It was first reported at 2,500,000 tons, but is now reported at 3,000,000 tons for the government's own shells, and 500,000 tons for account of the government's allies. The freight car buying programme appears to cover 100,000 cars, 50,000 box, 25,000 hoppers and 25,000 gondolas, at least that is what is contemplated in the enquiries against which bids were to be filed at Washington last Wednesday. It is stated that 50,000 cars may be bought late in the year. Reports several weeks ago indicated 150,000 cars or more, but very lately there was a rumor that only 50,000 would be bought.

The government is seeking heavier de-

liveries of plates from the plate mills, asking in general that they make 75 per cent. of their output in government form.

The Steel Corporation's steel ingot production is this week reported at 20,285,061 gross tons, against 29,910,589 tons in 1916, indicating a decrease of 625,000 tons. The Institute's recent preliminary report on total ingot production indicated 42,200,000 tons, against 41,400,000 tons made in 1916. If these figures are to be followed it would mean that the independents increased their production by 1,400,000 tons while the Steel Corporation had a decrease of 625,000 tons. That might be a reflection of the fact that the independents increased their capacity more than did the corporation, while it is a fact that both suffered from lack of coke. The corporation, however, was particularly short of coke and was awaiting completion of its very large by-product coking plant at Clairton, near Pittsburgh, which was originally expected by the end of last September, but is only now nearing completion. When that plant is in operation the corporation will probably have no coke troubles. The plant will be entirely independent of the railroads, receiving its coal by water exclusively and shipping its coke to the nearby Carnegie furnaces over the interplant railroad.

FOR SALE — PLATING AND POLISHING plant, complete, in first-class running order. To manufacturers now sending out their plating this is an opportunity to acquire a high-class equipment at a low price. Must be sold and moved quick. Garland Stove & Foundry Co., Hamilton. (tf)

FOR SALE—MACHINERY—HEAVY BENDING brake, power punch, foot punch, folding machine, forming rolls, 35" exhaust fan, double spindle polishing lathes, upright drill, circular saw table, grindstone, two anvils, eight vises, and miscellaneous tools. Bargains for quick sales. Garland Stove & Foundry Co., Hamilton. (tf)

15" x 8' SEBASTIAN LATHE, $125; 20" BARNES two-geared power feed drill, $65, both excellent condition. Massecar, 163½ Church Street, Toronto. (c15m)

FOR SALE—ONE NATIONAL BOLT CUTTER with complete set of die holders for bolts up to 1½" in size. Machine is in excellent condition and practically good as new. Canadian Blower & Forge Co., Kitchener, Ont. (c15m)

SECOND-HAND DIRECT CURRENT GENERator, 60 k.w., 110 volts, 680 r.p.m., compound wound; can be used as 880 h.p. motor. Helena Costume Co., 190 King Street, London, Ont. (c16m)

FOR SALE—40 HORSE-POWER MOTOR—ONE 40 horse-power, type C.C.L., Westinghouse motor, 3 phase, 550 volt, 25 cycle, 750 R.P.M., with sliding base. H. Mueller Mfg. Co., Ltd., Sarnia, Ontario. (c14m)

## WANTED

SHAPER, BACK-GEARED, DISC GRINDER and press, saw table with metal top; hand miller. Must be all in good shape. Box 389, Canadian Machinery. (c14m)

### REPRESENTATIVES WANTED

TO HANDLE ONE OF THE BEST FACTORY trucks on the market. Man devoting a fair amount of attention to this line will be able to make good thing out of it. Give particulars (in confidence) of lines you are now handling, etc. Box 392, Canadian Machinery. (c17m)

WANTED SALESMAN OR MANUFACTURers' agent who can handle line of high-speed steel. Box 390, Canadian Machinery. (c14m)

AGENCY OPEN FOR HIGH-GRADE LINE OF high-speed steel (American). Box 391, Canadian Machinery. (c14m)

CANADIAN AGENT WANTED TO HANDLE line of drinking fountains made in Canada. Man calling on manufacturing plants, public buildings, etc., preferred. Box 393, Canadian Machinery. (c16m)

## METAL STAMPINGS

METAL STAMPINGS — THE HAMILTON Stamp and Stencil Works, Ltd., Hamilton, Ont. (c14m)

## HELP WANTED

SUPERINTENDENT WANTED IN CANADIAN factory who is capable of handling a modern, up-to-date plant manufacturing high-grade automatic screw machine products. Must have undoubted ability to demonstrate machines, train operators, maintain organization at high state of efficiency, and handle help so as to get maximum results at minimum costs. Situation permanent to a live wire. Apply Box 394, Canadian Machinery. (c15m)

## SPECIAL MACHINERY

H. C. THOMAS, GENERAL MACHINE SHOP, tools, jigs and machine repairs. 301 King St. W., Toronto. Telephone Adelaide 3836 tf

MANUFACTURERS—WE CAN UNDERTAKE work to any specification—munition production equipment or otherwise. Write W. H. Sumbling Machinery Co., 7 St. Mary St., Toronto.

JAMES BAIN & SON, GENERAL MACHINists, Hamilton, Ont.—Machinery repair work. Special machinery built.

## PATTERNS

TORONTO PATTERN WORKS, 65 JARVIS Street, Toronto. Patterns in wood and metal for all kinds of machinery. (cfm)

### SAW TABLE

Goldie McCulloch saw table for sale—in first class running order, carries 18" saw with mitring and cut-off attachments. Countershaft attached to frame. All boxes and working parts in first class running order. Saw raises and lowers automatically. Valve particularly in good shape. Will sell at bargain.
J. RODERICK & SON, St. John, N.B.
(c15m)

# FOR SALE

6—No. 4 B. G.—P. F. hand screw machines with automatic chuck, wire feed and oil pan; also miscellaneous lot of screw machines, drill presses, tapping machines, oil extractors and small size twist drills.

**PACKARD FUSE CO.**
**St. Catharines, Ont.**
(c14m)

## FOR SALE
## IMMEDIATE SHIPMENT

Six (6) 600-ton vertical Shell Presses (for 6" shells) complete with pumps and accumulators. Have been used but eight months and are in good condition. Terms and price to interested parties.

**United Engineering & Foundry Co.**
PITTSBURGH, PA

## Brown & Sharpe
## AUTOMATIC GEAR CUTTERS

2—No. 13 Spur and Bevel Gear Cutters
2—No. 3-36 Spur Gear Cutters.
6—No. 3-26 Spur Gear Cutters
1—No. 6 Fellows Gear Shaper

All the above in good condition and in stock for immediate delivery.

**Riverside Machinery Depot**
**19-29 St. Aubin Ave. - Detroit, Mich.**

## Manufacturers' Opportunity

Our capacity being totally absorbed by increasing business in our transmission lines, we have decided to dispose of the following:—

100—½ and 1 ¼ H.P. air-cooled gas engines in semi-finished condition, with patterns, jigs, etc.

Patterns, gauges, jigs, special machinery for manufacturing three sizes of threshers, very well known in Province of Quebec.

Patterns, gauges, jigs, etc. of 26" band saw, jointer, cutwood saw bench.

With this equipment is included all drawings, cuts, shop details and present repair business and good-will of the company in above lines.

Attractive bargain to serious party. Apply to The A. Bernard Industrial Co., Fortierville, Que. (c16m)

# Hendey 18-inch Geared Head Lathe

A good point in this lathe lies in its eight mechanical changes of speed for spindle with driving shaft running at constant speed — four direct and four through back.

**Write for descriptive circular**

**The Hendey Machine Co.**
**Torrington, Conn.**

## SPEED, ACCURACY, ADAPTABILITY

Thirty-six different threads and feeds are had through mounted change gearing, each change being quickly made through controlling handles in gear boxes.

Lathe has automatic stop for stopping carriage in either direction when feeding or screw-cutting—invaluable for internal work to shoulders and for duplicating pieces.

# Worm Gearing: Principles of Design and Manufacture I

By Francis J. Bostock

*For many years the manufacture of worm gears was [illegible] and more or less out of thumb methods and as a consequence efficiencies were unsatisfactory. Improved methods of design and manufacture have recently effected such improvements that the worm gear is to-day one of the most efficient methods of power transmission. Considerable interest attaches to the [illegible] machines and methods used in the production of worm gears.*

UNTIL recent years the theory of worm gear, and still less its manufacture, was very little understood; the gears previously in use were generally for the purpose of transmitting "motion" from one member to another, and usually consisted of a worm of large diameter and low lead angle meshing with a cast wheel, the teeth of which had not been machined. The natural result was that low efficiencies were obtained, hence their use was discountenanced by engineers. All this has now changed; its construction has of late years become a science and its manufacture a precision accomplishment, and it will be the endeavor of the author to indicate some of the factors which have enabled this to be accomplished.

It is not the author's intention to discuss the Hindley or globoidal type, because for general purposes it does not, to his mind, represent such a sound manufacturing proposition as the parallel type, to which the following remarks upon design and manufacture will apply.

### Theoretical Considerations

Before proceeding with the practical part, however, it will be well for one to become acquainted with the terms used, their relations and the theoretical conditions which have to be fulfilled in order to obtain successful gears.

The ratio, as in all other forms of gearing, is dependent directly upon the number of teeth or threads. The distance from one tooth to the next, measured along the pitch line, is called the pitch, and when measured along a line parallel to the axis it is called the linear pitch. The normal pitch is that when it is measured normal to the thread, whilst the circular pitch is measured circularly at right angles to the axis. It will be observed that the circular pitch of the wheel is equal to the linear pitch of the corresponding worm.

The distance travelled, parallel to the axis, by a thread when making one revolution round the worm is called the lead; obviously it is the product of the number of threads and the pitch. As the thread or helix travels round and along the worm it naturally makes an angle to the axis, or to a line parallel to it; this angle is called the spiral angle, and its complement the lead angle. Trigonometry easily establishes their relations.

There are many factors entering into the design of worm gearing. It is not the author's intention to elaborate them, but chiefly to mention a few all-important points that make or mar efficiency.

The lead angle bears an important relation to the efficiency and durability of a worm gear. For many years the makers did not realise the importance of using a high lead angle, and the unfortunate experience that many have had has not been due to any inherent defect in the system, but to bad design.

If the worm thread be considered as an inclined plane, one will immediately see that the effect of friction is to increase the slope by an amount equal to the angle of friction; this has the effect of deflecting the direction of the resultant pressure and consequently reducing the torque on the wheel. The maximum efficiency of a worm gear is obtained when the lead angle approximates 40°—40′, and that 50 per cent. efficiency obtains when the worm angle is equal to the angle of friction, at which point the gear is irreversible.

[illegible] importance of a high lead angle

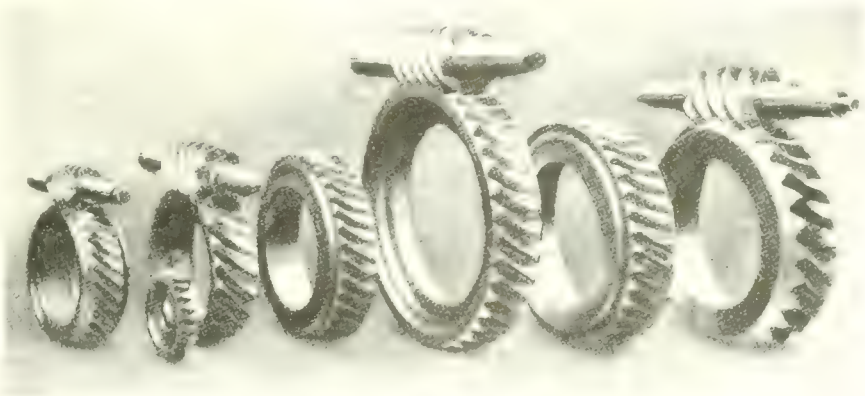

FIG. 1. A GROUP OF WORM GEARS, SHOWING SMALL NUMBER OF WORM

[illegible] paper read before the Manchester [illegible] and Association of Engineers.

FIG. 2. SECTION BY A PLANE CONTAINING THE WORM AXIS AND AT RIGHT ANGLES TO THE WHEEL

FIG. 3. [illegible] WORM AND WHEEL

cannot be too strongly emphasised, and it is useless trying to get high efficiency with a low lead angle. In order to obtain this angle it is necessary to reduce the diameter of the worm as much as possible, which not only gives a better angle, but also reduces the rubbing velocity. Thus one will readily see the reason why so many worms are of small diameter and solid with their shafts, similar to those shown in Fig. 1.

### Influence of Speed on Pressure

Following this are other important factors, namely, the rubbing velocity and its relation to the pressure, the materials used, the area and form of contact. It has often been stated that the permissible pressure multiplied by the velocity is practically constant; this is not so, as it would mean that an increase in velocity would be accompanied by a corresponding proportional decrease in the permissible pressure, hence the same horse-power capacity at all speeds. Within the usual limits the law appears to be that the permissible pressure varies almost inversely as the cube root of the velocity.

Various materials naturally withstand different pressures; for comparatively light loads at somewhat slow speeds the combination may be a cast-iron wheel and a soft mild steel worm; then, for heavier duty, a cast-iron wheel and a hardened steel worm; afterwards, a phosphor-bronze wheel and a hardened and ground worm. The former may be purely motion transmitting, whilst the latter is for transmitting considerable power at high speeds.

### Contact Between Worm and Wheel

The next important consideration is the form and the area of the contact between the worm and the wheel. If one takes a section by a plane containing the worm axis and at right angles to the axis of the wheel, one obtains an idea of their contact, as will be seen in Fig. 2. On the involute system their engagement corresponds to a rack and spur, the revolving of the worm causing the imaginary rack to travel along, and so causing the wheel to revolve. Therefore one has a worm whose linear or axial section corresponds to a rack, that is to say, each side of the worm tooth will, on a central section, be a straight line at a predetermined pressure angle. This is the starting-point in manufacture, and it will be noted how this straight line system is used for generating, cutting and inspection, and having once established that basis on the cutters, etc., one knows that when the wheels have been developed by the hob at a specified centre distance they will correctly mesh with the worms. Fig. 3 shows a normal section of the same pair in engagement.

The precise nature of the contact between the gears naturally depends upon the details of their specification and the form of tooth used. This does not appear to have been thoroughly investigated by anyone; but in connection with it there are several important points which should have serious consideration by all interested. Worm gear, unless correctly designed, does not transmit a uniform velocity from one member to another; many gears as ordinarily designed do not give the possibility of such transmission. A close approximation is obtained with gears of comparatively fine pitches, and in those of a high lead angle any error is somewhat "covered up" by the adjacent means being in action in such a manner that by sustaining an extra proportion of the load distribution the variable velocity period is tided over.

It will be readily understood that if this uniform velocity be theoretically non-existent there will be a tendency for accelerations and retardations to occur as each tooth comes into contact. Often, however, the inertia of the parts prevents a great change in velocity taking place, but it does so at the expense of the gears. The teeth are then called upon to absorb this effect, which results in highly concentrated pressures having to be sustained by certain portions of the wheel teeth, whilst other portions are thus prevented from taking up their share of the load. The transmission of uniform velocity is therefore a most important factor in the accuracy and the utility of dividing wheels for precision work, also on the durability and life of gears when used for high duty transmission.

The usual method of considering the contact by taking a series of linear sections is very liable to give misconceptions, due to the probable absence of the effect of the functions governing the transmission of this uniform velocity.

To consider worm gearing as a kind of development from the screw is fundamentally wrong. The pitch surfaces of worm gear are cylinders lying at right angles to each other, hence they only touch in one point; thus the theoretical conditions obtaining in a screw and nut whose pitch surface coincide cannot hold good for tangential ones. It must not be overlooked, however, that the theory of the triangle of forces on an inclined plane must hold good. The resultants of the forces acting on the teeth are the resultants of a series of differently inclined planes acting in different directions. In order to obtain an adequate idea of the problem it should be tackled as a three-dimensional one, thereby embodying the rotational effect of the gears.

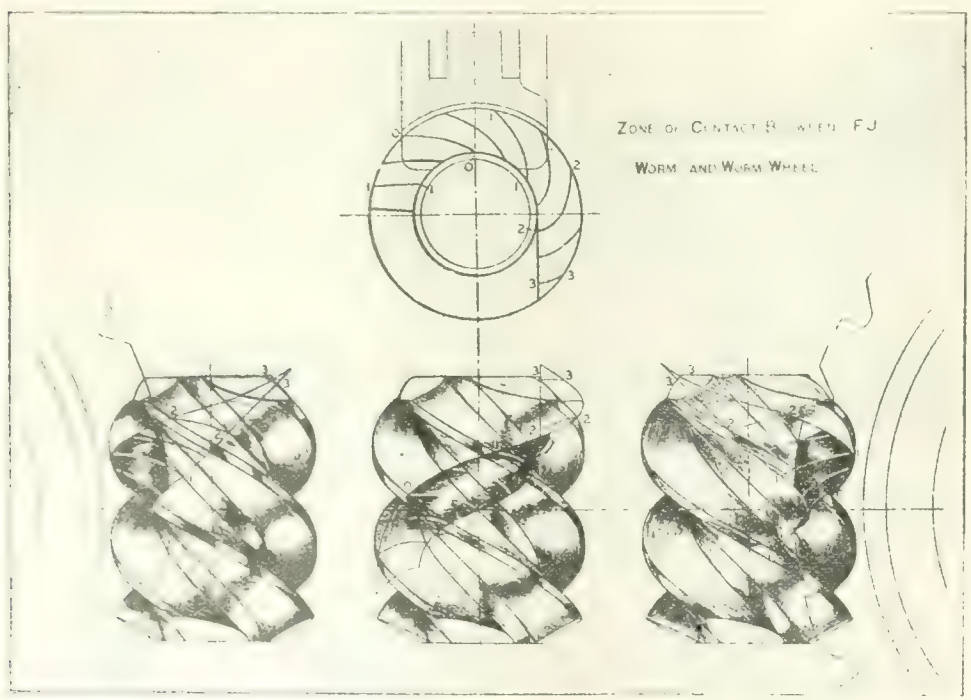

FIG. 2. FOUR VIEWS OF WORM DESIGNED FOR UNIFORM VELOCITY

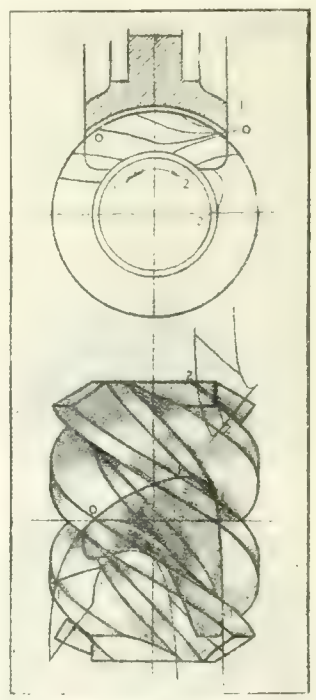

FIG. 3. WORM GEAR DESIGNED ON ORDINARY LINES.

### Fundamental Condition

To put the fundamental condition in a simple manner, one can say that, consistent with the transmission of uniform velocity, the normal to the surfaces from the point of contact must always cut the central plane, which contains the axis of the wheel, at a point on the straight line lying on the wheel-pitch cylinder, and consequently tangential to the pitch cylinder of the worm; thus for every point of intersection between a worm thread and the zone of contact there is always a definite relation between its angular and longitudinal positions. If contact takes place at any other point than this intersection it does so to the detriment of the transmission of uniform velocity.

Furthermore, the effect of the functions governing uniform velocity has a direct bearing upon the real rubbing velocity between the gear teeth. Usually this is considered as being the product of the circular pitchline velocity of the worm and the secant of the lead angle, but when uniform velocity obtains it may be only one-third of that calculated. The real action is then a combination of rolling and sliding, which means that instead of having almost wholly sliding action, the majority of it is replaced by rolling action.

Illustrating the foregoing remarks, Fig. 4 shows four views of worm and wheel of 4 : 25 ratio, designed to transmit uniform velocity. The ribbon-like area stretching across the teeth is the zone of contact between the gears when the worm is rotated in the direction indicated in the end view. The intersections of the worm threads and the zone give the lines of contact between the worm and wheel teeth, wherein it will be observed that the contact line starts on the entering side of the wheel face, where it is practically straight, radial and parallel to the wheel axis; it then travels across the face, with its outer portion gradually lagging behind, and finishes tangentially to the bottom of the tooth.

The top and end view also shows a series of intersections for every 45 deg. rotation of the worm; the alternate lines giving the intersections which correspond to 90-deg. movements, or, as one is considering a worm which has four threads, the line of contact on each thread.

### Rubbing and Rolling Actions

Following the direction of rotation, it will be noted that if the contact for one thread be on the line marked 0, the next thread will have contact on the line marked 1, the following one on 2, etc. Now the distance between 0 and 1 corresponds to one thread, and is therefore equal to a 90-deg. rotation of the worm, but when this movement takes place the actual contact also travels in the same direction as the worm through a distance of approximately 50 deg. to 60 deg., hence about two-thirds of the motion is transmitted by a rolling action, and only one-third by sliding. This means that instead of having the gear teeth rubbing against each other, say, at 1,000 ft. per minute, rolling action is so introduced that the real rubbing velocity is reduced to about 350 ft. per minute.

A further zone of contact for similar gears (4 : 25 ratio, 15-deg. pressure angle, 30-deg. lead angle), but designed upon ordinary lines (see Fig. 5), is of special interest. In this case the zone is actually interrupted near the central plane, and almost the whole of the contact consistent with uniform velocity takes place on the approaching side of the worm wheel, meaning, therefore, that if the worm be placed in engagement with the wheel, contact between their teeth takes place on the extremities of the worm, when, in many cases, the centre teeth have practically no contact. There is also a duality of the lines of contact, which, during the revolution of the gear gradually travel towards each other, meeting just beyond the central plane, where contact entirely ceases.

On account of the contact-point not travelling in the diretcion of rotation to any appreciable extent, the rubbing velocity has practically its full theoretical value, whilst rolling action is almost non-existent. The research work concerning the contact and the real action which takes place in worm gear has enabled one to account for a large number of inherent difficulties which have often been regarded as insoluble, but it is too lengthy to be further considered here; at the same time it might be well to note the comparison between the zones of these two gears, which are identical with the exception of the contours of their teeth.

A study of the zones of contact for a series of gears reveals to one not only how many teeth are in actual simultaneous contact, but also how many times the projected area may be said to be in continuous contact, thus indicating how much of the load should be proportioned to each wheel tooth; usually it varies from 1.5 to 3 times the projected area. A fine pitch gives more teeth in contact, but on a lesser projected area than a coarser pitch; the advantage, however, appears to be in favor of the latter.

### Characteristics of Standard Series

The characteristics of a standard series of worm gear are shown in Fig 6. The curves indicate the probable advantageous number of threads and teeth to sue in the composition of a required ratio, also how the lead angle, the pressure angle, and the heights of the teeth vary with the number of the threads in the worm. It also shows the average pitches in contact, and the respective load-carrying capacities, together with the gross efficiencies which, with ordinary manufacture, are obtained by the unit as a whole; this of course includes all frictional losses due to internal and external causes.

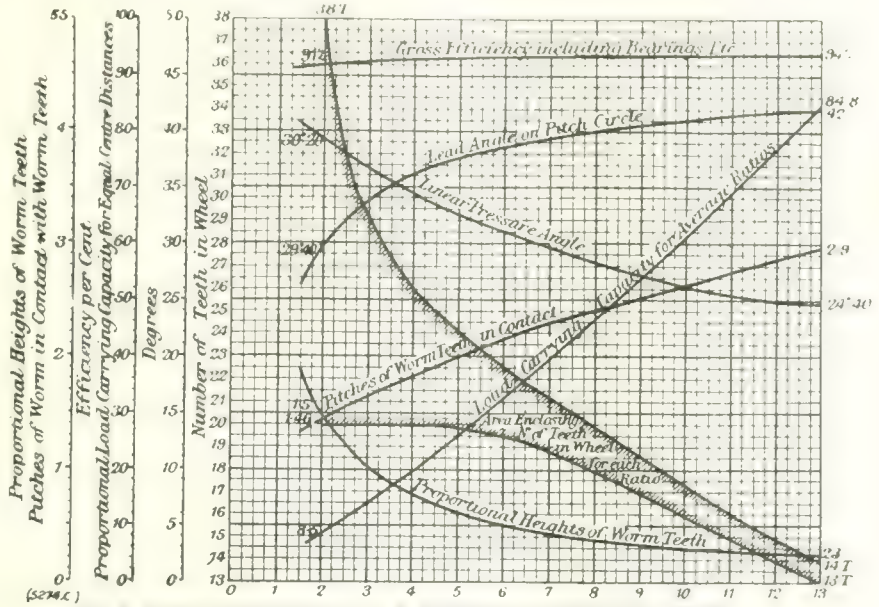

FIG. 6 CHARACTERISTIC OF 4 : 25 STANDARD SERIES OF GEARS

### Thermal Considerations

The amount of heat generated is another factor to considered. All frictional losses produce heat, and if the amount of heat generated be greater than the amount radiated, dissipated or conducted away, the temperature of the gear unit will rise. When it rises above a certain point ( about 250 deg. F.), the oil film breaks down and lubricating value ceases, but they are usually run at a nice warm temperature (150 deg. F. to 175 deg. F.).

Thus it is that the thermal characteristic has also to be considered, for which purpose one must know, in addition to the foregoing, the load factor or the proportional time the gear will run on various loads, and the thermal capacity of the case, or how many British thermal units it can radiate or conduct away at various temperatures. By these data one can predetermine the temperature rise of the gear unit at the end of any period of running under a certain load factor.

The author has known cases of gears

[illegible] transmitting only one-quarter or one-third of [illegible] capacity, solely on account of the gear cases containing them not having sufficient radiating capacity to get rid of the heat generated, and as the thermal capacity of the gear case is usually the limiting factor of the unit, the gears can often be subjected to considerable overloads for short periods without any injury. One of the great advantages of worm gear, i.e., its being able to transmit great reductions between two members only, is likely to be nullified if this thermal factor be overlooked.

(To be continued.)

## BIG INCREASE IN EXPORTS TO GREAT BRITAIN

IT is generally known that Canada's exports of war munitions and foods to the United Kingdom have increased tremendously since 1914, but the actual figures transcend anything the man in the street is likely to estimate. The customs report for the year ending March, 1917, has just been tabled in the House of Commons, Ottawa, and it shows that Canada's trade—even without taking into account the wonderful increases made in the past twelve months—has in some respects attained proportions that no one would have thought possible. This is not accounted for by the increase in prices. In volume, as well as in value, Canada's exports to Great Britain have soared astonishingly. The figures for a few familiar war munitions are here compared for the fiscal years 1913 and 1917:

| | 1913 | 1917 |
|---|---|---|
| Cartridges ... $ | 6,768 | $238,148,300 |
| Explosives ..... | 5,387 | 30,815,956 |
| Gasoline launches | 135 | 15,145,150 |
| Guns ..... | 7,667 | 2,175,618 |
| Boots ..... | 1,440 | 1,111,026 |
| Ferro-silicon .... | nil | 870,240 |
| Wire and nails ... | 543,451 | 3,138,100 |

### Mineral Exports to Britain

Canada's mines have also been working overtime furnishing metal for the outside world. For the United Kingdom alone, the exports of copper in 1917 totalled 144,613 cwt., worth $1,080,133, as compared with only 53,855 cwt., worth $403,851, in 1913. Nickel worth $1,862,796 (124,001 cwt.) was sent to the United Kingdom, as compared with 48,267 cwt., valued at $718,145, in the year before the war. The bulk of Canada's nickel still goes to the United States, and the figures for the fiscal year 1917 were 702,203 cwt., worth $7,062,758.

### Lumber, Horses, Bullion

Some forms of lumber have tended to swell Canada's war exports considerably. In 1917 the Dominion sent 50 per cent. more spruce and other deals to the United Kingdom than in 1913, but the price had so increased that the value of this form of export nearly doubled, being $8,594,803, as compared with $4,683,821.

Only 74 horses, worth $14,400, were exported to the United Kingdom in 1913. By 1916 the number had risen to 21,833, worth $3,899,822. In 1917 the number dropped again to 9,499, worth $1,898,820.

A curious feature of the customs report is that it records imports of gold bullion from the United Kingdom in 1917 worth $14,646,131, as compared with only $98,409 worth in 1916.

## AERIAL PHOTOGRAPHY HIGHLY DEVELOPED

AERIAL photography has greatly developed during the war. During the single month of September, British official reports state that 15,837 aerial photographs were taken by the British alone. No new trench can be dug, no new communication system opened up, no new batteries placed, but the ever-present and infallible camera above records it for the examination of the staff below. So piercing has been this work that camouflage has been developed as a protection, thus forcing aerial photography to even greater ingenuity.

Every sector of the front is divided into plots about half a mile square, each one numbered and entrusted to a squad of photographers who become fully familiar with it. As fast as the photographs are made they are developed, printed, reduced or enlarged to a standard scale, and then fitted into their place on the large composite photograph of the sector. This work requires a force of experts in developing, printing, and enlarging, as well as in map reading and interpretation.

Cases are on record where only 20 minutes have elapsed from the time a photographer snapped his camera over the German trenches until his batteries were playing upon the spot shown. In that time the airman had returned to his lines, the photograph been developed and printed, the discovery made, and the batteries given the range and ordered to fire.

## SAILORS OF NEW U. S. SAILING SHIPS LEARNING OLD CHANTEY SONGS

THE United States Shipping Board Recruiting Service at Boston issues the following:

Stanton H. King, of Boston, has the only war job of its kind. He is official chantey man for the American merchant marine. His work will be to revive chantey singing among merchant sailors who will join the country's new cargo ships through the United States Shipping Board Recruiting Service, national headquarters of which are at Boston.

While chantey singing has declined on all seas, owing to the change in recent years from sailing vessels to steamers—there not being much opportunity to "heave and haul" on board a steamer—its revival is considered important for two reasons.

Chanteys insure team work when a crew are pulling on ropes, even aboard steamers; while the building of large numbers of American schooners means an increased demand for men who can "reef, hand and steer" on sailing vessels, where chantey singing used to flourish.

The Shipping Board trains men to serve on steamers, but if a certain percentage ship on sailing vessels and carry with them the almost lost knack of chantey singing, they will be the better equipped for their work, according to sharps on the seafaring game.

Stanton H. King probably is the country's best known chantey singer. Chantey singing is part of a weekly entertainment he gives Jack ashore at a mission of which he is head. The programme is usually varied, and to hear Mr. King lead his sailor friends in "Shenandoah," "Bound for the Rio Grande," or "Blow the Man Down" is to understand the psychologic punch of the well-sung chantey.

Mr. King is an old salt, and learned chantey singing in its home, on deep-water vessels. He began going to sea 38 years ago.

## FORMER GERMAN MONOPOLIES

By M. M.

NOT very long ago Messrs. Elder Dempster & Co. bought from the Public Trustee under the Trading with the Enemy Act a large block of shares to the number of 185,279 in the Pacific Phosphate Company, the price paid being £575,000. This was an enemy concern which held important concessions in regard to phosphate deposits in several of the Pacific Islands.

In view of the increasing demand for fertilizers, which it is expected will become greater when normal conditions are restored, the transaction is regarded as singularly good. Recently, too, another company in which Lord Pirrie is largely interested acquired a big wolfram ore property in Burmah, the purchase price being said to be about £250,000.

From wolfram is smelted the metal tungsten which, used as an alloy, has remarkable properties in hardening steel. Although the bulk of the world's supply of wolfram is produced in the British Empire, Germany had almost a complete monopoly of it before the war, but steps have already been taken to prevent German control in future. The Bristol port authorities are preparing to deal with this industry and the expenditure necessary for the erection of works and warehouses has been sanctioned.

THE boiling points of many common metals are sufficiently high to indicate that a temperature of at least 1,500 deg. Cent. might be easily read by the aid of liquid couples. The question immediately arises as to whether metals in the molten state develop an E. M. F. suitable for pyrometric work. The results so far obtained indicate that in general the thermo-electric properties are unaffected by fusion, and that a temperature E. M. F. curve shows no diminution of continuity at the fusion point. Exceptions to this rule are furnished by bismuth and antimony, both of which show an abrupt bend in the curve at the melting point.

# Some Considerations Regarding Modern Plant Organization IV

By M. H. Potter

*The factors which enter into the successful manufacturing business of to-day are interdependent to an ever-increasing degree. Location, type of building, transportation facilities, staff organization and plant equipment are features which require to be considered both singly and as a whole in relation to the particular product to be undertaken. A clear and concise idea of such considerations is necessary before entering into the [illegible] of manufacture.*

IT is important to know the expense of manufacturing, but it is equally important to distribute it with the least chance of error. This requires a basis of distribution. Several methods may be considered:

1. A percentage on the value of material and labor.

2. A percentage on the value of the material used.

3. A percentage on the value of productive labor.

(The allocation of manufacturing expense to machines and its distribution by means of a machine rate will be referred to later.)

### Difficulties of the Various Methods

A distribution of manufacturing expense, having as its basis the value of the materials and the labor is not an equitable one by reason of more expensive material being used on one contract, or shop-work order, than that used on what may be similar production, notwithstanding that the material has been subjected in each case to the same operations, occupying the same time, and using perhaps in each instance machinery with a like expense burden of operating.

The principle chiefly involved is that the manufacturing expense is an occurence of time, and as such should be distributed over units of time.

The third method is largely used, and because it does in some instances effect the same distribution as that obtained by the fourth method they may incorectly be considered to be similar in their results. This method also appeals in application on the ground of convenience.

The proportion of manufacturing expense to be charged to a particular shop-work order under the third method is obtained by using a percentage of the value of the productive labor charged to that order. This percentage is the rate per cent. obtained by dividing the total amount of the manufacturing expense by the total amount paid for productive labor. In using this plan, the workman earning the higher wages must necessarily bear a larger amount of expense than the one earning lower wages, whereas by a more equitable distribution the reverse would be more in accordance with the facts.

The convenience of using a percentage basis at times cannot be questioned, but convenience or simplicity should not prevent the use of more accurate methods when greater accuracy is essential.

The using of the fourth method of distribution does not necessarily mean greater detail in cost keeping. The general practice is to remunerate labor at a rate per hour of time worked. The total number of hours of productive time is obtained from the time-sheets or a similar source and summarized. The entry in the cost accounts states the number of hours or fractions thereof charged to each shop order, and the charging of the item of expense is but a matter of detail when the rate has been determined, which will be the cost in expense per hour of productive time.

It should not be lost sight of that each department must bear its proper proportion of expense. Some pains may be necessary in making the first distribution, but if this is carefully done a basis is provided which reasonable observation of the department operations will either confirm or show wherein it is in error. Prompt adjustment of apportionment required by changing conditions should be made when such changes occur.

### The Machine Rate

The necessity of knowing the expense of operation and maintenance of the various machines used introduces the machine rate. The rate consists in treating each machine as a productive department and charging it with power, oil, repairs, rent, taxes, insurance, depreciation, interest and other items of manufacturing expense, and charging shop-work orders for work done by machines at a rate per hour of machine time representing the cost of machine operating.

The more obvious of the costs connected with machinery are of four classes, as follows:

1. Those based on occupancy of space which we will call space cost.

2. Those based on the cost of the machine itself, called machine cost.

3. Those based on special expense connected with the machine when in operation (but not including power), called machine use cost.

4. Power cost.

The criterion for distributing burden over production on the basis of use of machinery is clearly time; the element of the same machine (when in proper repair) will always be capable of producing the same relative results. Even if the nature of the job requires lower speed and loss is suffered it is right that the loss should be charged to the order requiring such reduced speed rather than to the machine itself, for, so to speak, the loss is the fault of the job and not of the machine.

### 1.—Space Cost

The first, or space cost, will be a certain proportion, determined by the machine's occupancy of space, of the space cost of the entire establishment. This space, however, is not determined by the mere floor dimensions of the machine, but it is the space necessary for its successful operation, with room for operatives, for light, for feeding materials and delivering product, for passageways to and from it, etc. As a result of this subdivision, then, we find on account of space a burden of general cost which this machine must bear. The elements of the cost are usually five or more.

1. Interest on investment in land and all buildings thereon.

2. Repairs to buildings which are really a part of the costs of running the machines which they are built to house.

3. Depreciation of buildings which repairs cannot prevent.

4. Taxes on land and buildings.

5. Insurance on buildings.

Allied to these but figured on a somewhat different basis are light and heat.

### 2.—Machine Cost

The second group of expenses is divided into the five normal elements:

1. Interest on the value of the machine itself.

2. Cost of repairs due to the passage of time rather than to use.

3. Depreciation that repairs cannot prevent.

4. Taxes (this machine's proportion of the taxes upon machinery).

5. Insurance (this machine's proportion of the total insurance on machinery).

### 3.—Machine-Use Cost

The third group of expenses is divided into:

1. The direct expenses in operation, such as for oil and cleaning, but not power.

2. Repairs due to wear and tear.

3. Depreciation due to use.

4. The five normal elements, interest, repairs, depreciation, insurance, and taxes—on any special tools which may be required in connection with this machine.

### 4.—Power Cost

The last group is power cost. The determination of the proportion which should be attached to each machine must be based upon figures, but in principle it is very simple. The power establishment is itself subject to three of the four groups that we have already connected with the other machines, that is, space cost, machine cost, machine-use cost, for the power plant is responsible for its share of the ground rent of the whole establishment, for the five normal elements upon its own building, for its

### Machine Total Cost

The remaining twenty-five list of things of which the cost can be applied [illegible] These four groups of cost-space cost, machine cost, machine-use cost, and power cost, are the total costs of running the machinery. This total for each machine, divided by the number of working hours in a year gives what is commonly called the "machine hour rate." Some allowance is always made, of course, for necessary idleness of all machines such as for repairs, oiling, cleaning, etc. Every machine in the shop has its symbol or number, and has attached a tag giving its hour rate. Since all work is done by the authority of a job order, it is a simple thing for the operator when reporting his own time to report also the time of machine cost to be charged to each job order, and it covers all the burden which we have been able to attach to the use of machinery.

### Idle Time

The determination of cost in connection with machinery has so far been on the assumption that all machinery is driven full time. Theoretically no machine should ever be idle except for repairs, oiling, cleaning, etc. Practically, however, this is impossible. It may chance for instance that on some work one planer can keep up with three drill presses and that on other work one drill press can keep up with three planers. It is obvious, then, that idle time is so far a matter of importance that it may throw entirely out of usefulness the calculation of the machine rate at full operating time and therefore must be introduced in many cases as a new element.

The rate charged for work done by machines should be based on the normal operating time, with a second supplementary rate representing the cost of the idle or non-operating time of machines, and items of expense which cannot be charged direct to any one machine. If, for instance, the expense of operating a particular machine is $180 for a month of 225 hours of full operating time, this would be a rate of 80 cents per hour for the work done. But if the machine was only run 200 hours, the rate charged to the shop-work order would be still 80 cents, with a second rate to provide for the distribution of the $20 representing the expense cost of the none-producing time of the machine, not allocated to the work in progress by the normal rate per hour.

A further reason for making two charges in the cost accounts for the machine operating: first, a normal rate based on the full operating time of machines, and a second rate to charge out the expense not taken up by reason of non-operating time of machines—is in knowing what excess of machine operating cost charged to work orders is caused by the various machines not being operated full time.

[illegible] operating cost barometer and should be carefully watched. The nature of the work done on certain machines admits of reports of machine time being returned daily showing the time operated and idle. It may be, if the machines require to be set up with each change of work and the changes are frequent, that too much time is being consumed in doing this. But if the idle time is known immediately, with prompt attention it may be reduced and the output increased.

## CONSUMPTION OF COMPRESSED AIR

AN easy method of determining the consumption of compressed air by air-driven machines has been recently given by a writer in *Foundry*.

Desiring to secure information regarding the amount of compressed air required per mould by different sizes of foundry vibrators, a small air compressor was used with a shut-off valve located between the compressor and the tank and in the latter the air pressure was raised to 90 pounds. The valve was closed and with a stop watch the time was noted that elapsed for the vibrator to reduce the pressure to 70 pounds. It may be assumed that for all practical purposes this would be equivalent to 80 pounds mean effective pressure, the amount in most general use in foundries. To illustrate in ever figures, it will be assumed that the tank holds exactly ten cubic feet of air and that it takes the vibrator exactly two minutes to reduce the pressure from 90 to 70 pounds. Therefore it is figured that the vibrator used 10 cubic feet of air in two minutes. By actual tests it has been found that the average time the vibrator is working while the moulder is drawing a pattern is about 15 seconds and, therefore, we get eight moulds with 10 feet of air and the vibrator uses 1¼ feet of air per mould. This same principle may be applied to any air-driven tool or moulding machine and it is believed that the results are more nearly representative of actual conditions than theoretical calculations.

## THE EFFECT OF HEAT ON COLD ROLLED ALUMINUM

IN a paper read before the Institute of Metals by H. C. H. Carpenter and L. Tavener some interesting facts were brought forth relating to the behaviour of aluminum sheets when heated.

The effect of heating cold-rolled aluminum sheet at temperatures from 550 deg. to 300 deg. Cent. inclusive is to cause a very rapid softening of the metal as measured by the tenacity and the percentage elongation. As regards tenacity, the same ultimate value is reached in all cases. Softening is complete in 96 hours, and from 550 deg. to 350 deg. inclusive nearly the whole of this occurs in the first hour of the test. The elongation figures show a tendency to rise slightly as the temperature falls from 550 deg. to 350 deg.

At 250 deg. Cent. the rate of softening, while still considerable, is much less rapid. Between 600 and 800 hours are required for complete softening, and here also the same ultimate value of tenacity is reached as at higher temperatures.

From 200 deg. to 100 deg. Cent. inclusive the rate of softening is slow, and as the temperature of 100 deg. is approached, very slow. The actual sequence of changes can be classified conveniently under three heads:

(1) A comparatively rapid drop in tenacity in the first hour.

(2) A tendency either to cease falling or actually to rise, such rise, in one case only, bringing the tenacity up to the original value. This period is in most cases completed in 100 hours.

(3) A relatively very slow fall of tenacity sets in and is maintained on the whole steadily.

These tests are still in progress. Assuming the present rate of loss of work-hardness to be maintained, assuming also that the metal ultimately reaches the same tenacity as specimens tested at the higher temperatures, periods of the order of from one to three years will be required for completion.

It follows that no object is gained by using aluminum of this particular degree of work-hardness at temperatures which are likely to exceed 200 deg. Cent. in practice.

The cold-rolled aluminum has been shown to lose a considerable proportion of its work-hardness as a result of being heated in the temperature range, 200 deg. to 100 deg., with hardly any recovery of plasticity, as judged by the elongation test.

Le Chatelier's view that annealing a hard-worked metal was an easy thing to do was not borne out by the tests given in the paper, as far as aluminum was concerned. On the contrary, there was much evidence that Howe's view that many changes were going on concurrently was the fact with aluminum as with the other metals which Howe examined.

A circumstance which merits close attention is the change in the form in which silicon is present in the hard-worked and annealed states. It appears that in a hard-worked aluminum silicon is present to the extent of about 57 per cent. as shown, whereas when the metal is annealed the silicon appears to be combined.

LEAKAGE past the valves and piston will materially reduce the intake capacity of an air compressor. If the area of the intake valves is too small the cylinder will not be filled with air at atmospheric pressure, and, if the area of the discharge valves is too small all the air compressed will not be discharged. Poppet valves depend upon a difference in pressure on the two sides of 2 to 5 oz. for their action and may reduce volumetric efficiency by as much as 2 to 4 per cent. Mechanically operated valves of the Corliss type are very satisfactory but must be maintained in correct adjustment.

# PRODUCTION METHODS AND DEVICES

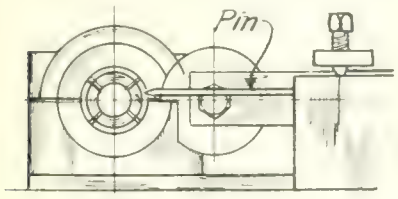
A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

## SCREW MACHINE KINKS THAT PROVED THEIR WORTH

By D. A. Hampson

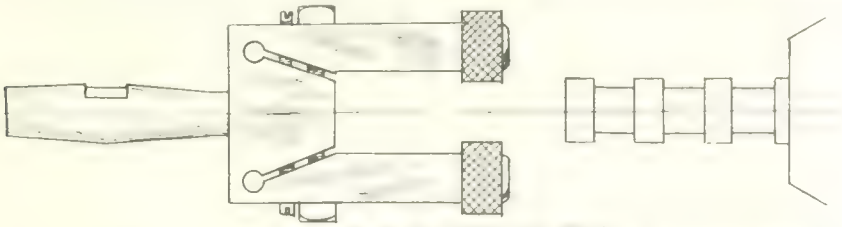
### A Chip Remover

IN a set-up on a Hartford screw machine, a gooseneck holder carried a turning tool and a 3-32 in. drill. The diameter of the work piece was 7-32 in. and the drill was set to a depth equal to the length of the turned part, so it will be seen that there was very little chip space. With the tool and the drill both in good condition the long, stringy chips curled up into a bunch and every so often would break the drill.



CHIP REMOVER

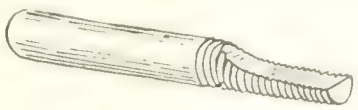
A chip remover of the simplest nature proved the remedy. Referring to the drawing, a pin is seen sticking out in front of the tool holder on the rear slide. This slide advances for its work just before the drill is withdrawn and in time for the pointed end of the pin to catch in the ball of curlings. The withdrawal of the drill and tool pulls them free from the chips which are held by the pin and fall as soon as the support of the former is gone. While this does not take away all of the chips the majority are cleared out—enough so there is no danger of the drill being pushed to one side and broken and enough so the machine can be styled "self-cleaning."



TOP VIEW OF KNURLING TOOL
NOTE TAPER OF SHANK IS SHOWN VERY MUCH EXAGGERATED

### A Knurling Kink

The knurling of the head of a brass nut of special form gave some trouble. The nuts were made three at a time on an Acme automatic and cut off with multiple tools, but we are here concerned with the knurling only, which, because of other operations, had to be done by a tool in the second position on the turret slide. The tool holder is shown. Two knurling wheels were used to produce the diamond knurl required, but the results were unsatisfactory no matter how they were adjusted, either too light an impression or a turning action, or erratic effects. By reducing the shank of the holder tapering away from the full size part directly under the set screw, the holder was permitted to swivel a few thousandths, and perfect work was produced without any further fussing. A



A TAP OF AN UNUSUAL FORM

notch for the set screw kept the holder from pulling out when withdrawn over the three heads and allowed the floating action that had improved the work.

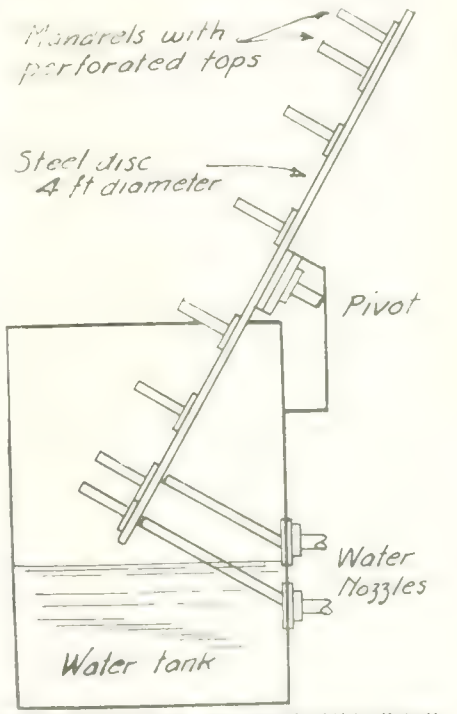
### Tap of Unconventional Form

A 5-16 in. 24-thread tap was run at the rate of 1,400 r.p.m. on a brass job in the automatic. The drilled hole could be only ⅜ in. deep for the work length of 5-16 in., and with the tapping attachment of the Acme automatic a good deal of breakage resulted if the tap was run at the full depth. Ordinary machinists' hand taps were used. The tap shown was tried out successfully and several were made up in the shop to complete the run of thirty thousand pieces. No flutes are cut in the tap but a liberal flat is ground toward the end after hardening. For brass work this tap will give interesting results.

## PROJECTILE WASHING

By R. C. White

WASHING the shell is a necessary evil which must nevertheless be done carefully and efficiently. Large quantities must be handled and a [illegible]



APPARATUS USED IN PROJECTILE WASHING

are surged up and down with a rope through a pulley conveniently located overhead. Others use a chain conveyor, and I have heard of a shop where an appliance similar to the one shown was used. The revolving table was about 4 feet diameter, and the tank holding the solution was about 5 feet by 2 ft. 6 in. deep. The mandrels over which the shell are placed are hollow and perforated at the tip so that the hot solution could be pumped to the interior of the projectile. The temperature of the solution whatever it may be should be slightly under 200 degrees Fah. The controlling mechanism under the spouts was so arranged that a cam permitted the 2-inch discharged pump to force the solution to the interior of the shell with sufficient force to remove chips, etc.

This arrangement necessitated the use of three men. One put the shell on the mandrels at one side of the disc and another man removed them at the other side, and the third man assisted in the handling. The results derived were entirely satisfactory in that the shells were thoroughly cleaned and the time consumed compared more favorably with other methods, the production being around 700 shells per hour with the pump discharging 75 gallons per minute.

removed in order that the varnish or rust preventative coating may stick. The shells are therefore put through an alkaline solution to remove the grease and then through a hot water tank to remove the alkali. Alkali as we all know promotes rust, so that all traces must removed. There are many compounds for this purpose, but a solution of 25 lbs. of common washing soda to 100 gallons of water is as efficient and as cheap as any

To handle these shells various methods are used. Some people use a wire basket [illegible]

## COMPARATIVE AREAS

By J. H. R.

WITHOUT duly considering the changes effected by the variation in the shapes [illegible]

first realize by experience that a surface bounded by the same length of perimeter, or circumference, would necessarily enclose the same space or area. Unless one is reasonably familiar with the general methods of calculating the areas of plain figures, it is frequently difficult to have them understand the relative wide range between the areas of regular geometrical

ticed that the formula for finding the area of the circle is .7854 $D^2$, but as the diameter is not yet known we must determine this from the formula D=.3183C, or 24×.3183=7.639 inches. It might be here stated that the constant .3183 is the reciprocal of the constant 3.1416. (The reciprocal of a number is the quotient of 1 divided by the number.)

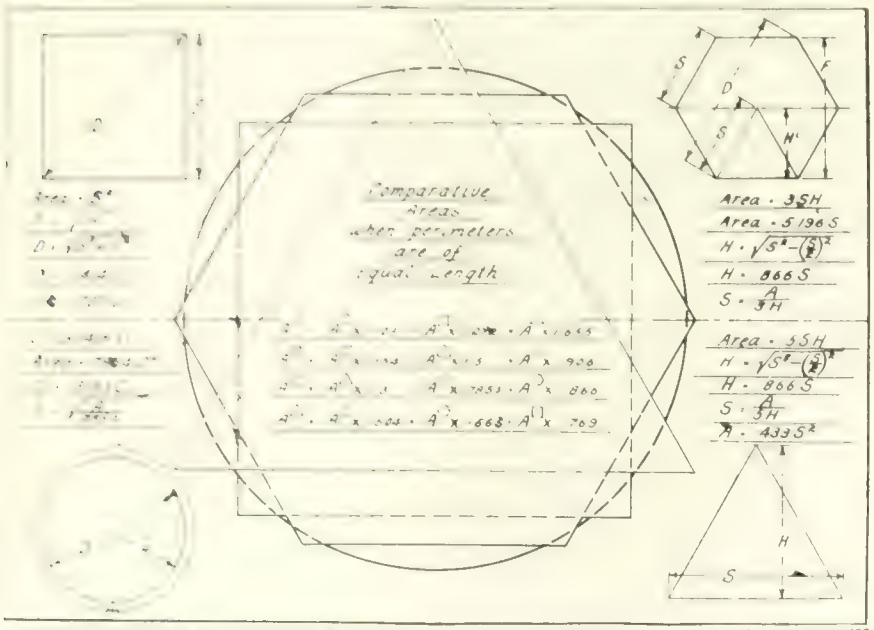


CHART SHOWING COMPARITIVE AREAS WHEN PERIMETERS ARE OF EQUAL LENGTH

surfaces that have for their perimeter lines of equal length. In order that a flat surface may be properly defined it is necessary that the space involved should be bounded by at least three lines, as it is quite obvious that it is impossible to develop a surface having one or two bounding lines.. It might be argued that in the case of a circle the perimeter or circumference is only one continuous line, but a brief study of this figure will demonstrate that it is composed of a line that is changing its direction at every point in its length.

The accompanying sketch illustrates, diagramatically, the relative or comparative areas of the four principal regular geometric figures, where the perimeters are of equal length, together with the necessary constants and formulae for calculating the areas of the different surfaces. As a circle is the greatest area that can be enclosed with a perimeter of a given length, it follows that the surface of any pologon, with given length of perimeter, will be greatest when the figure is regular in character. It is also evident from the foregoing that a triangle is the figure that must have the least area for a given circumscribing outline.

To illustrate this point more clearly we will suppose that in the accompanying sketch the perimeters of the various geometric figures have a common length of 24 inches. The circumference of the circle will be 24 inches, the side of the hexagon 24 divided by 6 equal 4 inches, the side of the square 24 divided by 4 equal 6 inches, and the triangle 24 di-

The area of the circle would be .7854 $D^2$ = .7854×$7.639^2$ = 45.83 inches. The area of the square is found by multiplying one side by the other, and as the side in this particular case is 6 inches the area will be $6^2$=36 square inches. The area of the triangle is found by multiplying the base S by one-half the altitude H, or vice versa. To find the area of the triangle, therefore, it is first necessary to find the altitude H. With a perimeter of 24 inches the side H will be 8 inches, and the height H can be found by the solution of triangles or using the formula

$$\sqrt{\left[S^2 - \left(\frac{S}{2}\right)^2\right]} \quad \sqrt{\left[8^2 - \left(\frac{8}{2}\right)^2\right]}$$

$\sqrt{(8^2 - 4^2)}$ = 6.928 inches.

Then the area = .5 SH = .5×8×6.928 = 27.712 sq. ins.

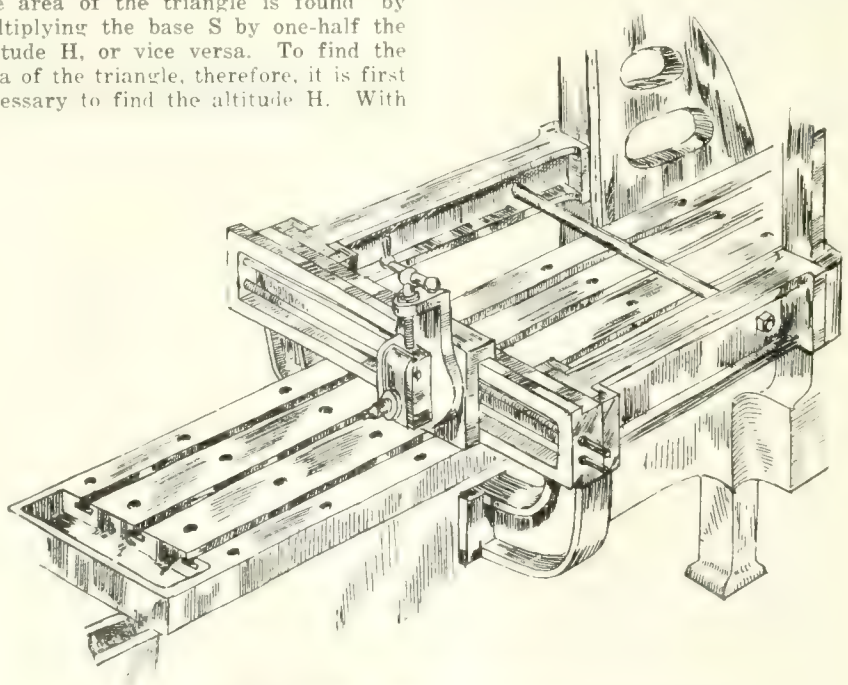
The side of the hexagon with a perimeter of 24 inches is 4 inches, therefore the area can be determined from the formula 3 S H. H will be $\sqrt{\left[S^2 - \left(\frac{S}{2}\right)^2\right]}$ or .866 S=3.464, and the area will be 3×4×3.464=41.568 sq. in. The other formulae on the chart will be found useful for reverse calculations. Within the center sketch is shown a number of constants by which the comparative areas can readily be found when the perimeters are of equal length.

## ONE WAY OF WIDENING A PLANER

By D. A. Hampson

THERE was a 40 x 15 ft. planer in the shop which was amply large for our regular work and for the odd jobs that came along until we took on the job of planing the bases of two thousand machines used for a munition job. These were castings approximately 60 in. square and 6 in. thick and the work was rough planing the under side and then finishing off pads and bosses on the top.

Planers are usually widened by setting out the housing on the side away from the operator. In our case this was not as practical for the machine was driven by a belt on each side and in fact, except for the feed gears, the planer was symmetrical so that the widening would have to be done on both sides to make any kind of a job of it. A layout of



VIEW OF PLANER SHOWING METHOD OF WIDENING.

both ways and a cost estimate was made but both were rejected for the scheme which is shown in the drawing.

Instead of spreading the housings and

disturbing the alignment and rigidity of the machine, the cross rail was removed and placed on brackets six feet ahead of its regular position. This was possible because of the long table and consequent range of stroke adjustment and because the cross rail was as long, wide, as on most 60 in. machines. By means of loose pieces on the patterns, two patterns were made to do for all four castings used in the change.

Two of these castings were the brackets proper. They were fitted to the bed of the machine, bolted and dowelled. The thrust of the cut was born by two columns which were fitted on one end to the front face of the housings and on the other to the back of the cross rail—they spaced the rail just so far ahead and were secured by the same means as the rail in its regular position. With the rail in the new position, there was plenty of room to plane the castings which had been too large for us. The cuts were not heavy, but at that the rig was substantial and good for heavier work. In place of the two gears driving the feed, two sprockets were supplied and these connected by a link belt (not shown).

When the job was over, we had the 40 in. machine as good as ever. We had not spent $200 for the change. We had a widening rig that two men could change in an hour, and a good one. For work that does not require an up and down movement of the cross rail, this is an arrangement worthy of notice. Another thought, it is a mistake to get a long planer without proportionate width between housings.

## PATTERN POINTERS

By D. A. Middleton

"One reason why I always like to mould the Duplex Co's work is because they round all the corners on their patterns," said a moulder. "You know if you are going to machine a casting, is takes anywhere from an eighth to a quarter to clean it up even the smallest ones have to have a sixteenth, and that means that you could round the corner to a radius of from one-sixteenth to one-quarter depending on whether only one surface is machined or two adjacent ones at right angles." Then again if there is no machining to be done, you can't expect iron to fill up a sharp corner nor the average moulder to do his work that way—he'll make the little fillet in there if you don't—so you might as well round the pattern to begin with and have a better looking pattern, better wearing corners on it, and make the moulder a lot less trouble in drawing it. And where you are depending on an outside foundry for your iron, it pays to get the good will of the moulders in it."

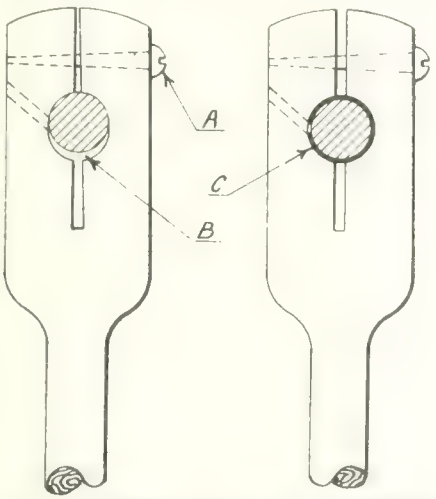
Before sending core boxes to the foundry, it is a good plan to try them out by filling with plaster of Paris and making a core for measuring and inspection purposes. This applies more particularly to small work—manufacturing where a little difference in the cored piece causes a big expense item in unnecessary shop work.

In some lines of manufacturing and in experimental work, steel parts are set in cast iron sockets or handles by running the iron around the steel. The pattern practice for this kind of work is to make the pattern as usual, adding to it an extension of the size of the steel part which is exposed when the article is completed. For instance, the heads of vise screws are sometimes cast on the screw and the pattern, besides the head part has a cylindrical part as big and as long as the screw is to be—but without threads. Then the screw is laid in the mould in the space made by the round just as if it was a core. And the iron is poured around it. It helps to make a tight construction if the steel pieces are heated before placing—the relative shrinkage is less. It is also imperative to notch or square or bend the steel pieces so the iron can get a more positive grip than by its contraction alone—the reason for this in the case of a vise screw is evident, the screw requiring not only something positive to drive it but a resistance to keep it from pulling out of the head.

## REPAIRS TO A CONNECTING ROD

By R. Hamilton

NOTHING is more annoying than pounding in a connecting rod, and this is particularly emphasized where noise is of special interest when it is absent. For a sewing machine to do efficient work it is necessary that no lost motion should exist in the various joints. One that is most likely to wear is the hole in either end of the wooden connecting rod, from the treadle to the crank on the main driving wheel. How one of these was repaired is shown in the accompanying sketch. On the left is the worn hole; when the clamping screw A was tightened there was an end play of over 1-32 inch, as shown at B. The repair is shown in the sketch on the right. The rod was taken off and the screw A backed away so that the slot was parallel; the sides of the worn hole were scraped out to round up the hole. A small narrow strip of [illegible] was cut and bent [illegible], and afterwards fitted into the hole so that when the pin was inserted and the screw adjusted the pin revolved freely but without side play, and when again placed in the machine ran perfectly free and without the slightest knock. To facilitate the lubrication of the pin the joint of the tin bush was placed adjacent to the oil hole.



METHOD OF REPAIRING WOODEN CONNECTING ROD.

## GRINDING ALLOWANCES

A QUESTION often asked is the amount that should be left on turned or bored work which is to be finished to size by grinding.

The answer is that this depends on certain factors which must be ascertained before the correct allowance can be determined. The object aimed at should be to so proportion the work between the lathe and the grinding machine that the total time taken by both in producing the desired degree of finish and accuracy is reduced to a minimum.

In many shops a great deal of time is wasted in turning too close to finished size and with too fine a traverse work which is to be afterwards ground.

In his desire to turn out a "good lathe job" the turner sometimes overlooks the fact that a smooth piece of work having only a small allowance may take as long to finish in the grinding machine as a rough-turned job on which more metal is left.

A good deal will depend on the grinding machines used. If these are heavy up-to-date machines, supplied with the right wheels, the speed with which a really rough-turned shaft or spindle can be reduced to size will be a revelation to many.

The chart printed on the opposite page shows the grinding allowances which are recommended for turned or bored work up to 12-in. dia. Although the amounts specified may, to some, appear excessive, they may be allowed with confidence in establishments possessing a grinding department run according to modern ideas of efficiency and lathes sufficiently powerful to take the coarse feeds recommended.

The following explanatory notes will serve to show the theory on which this article is based, and will assist in determining allowances for the exceptional jobs which will occasionally present themselves.

Taking first external work as being the more common, it will be noted that a larger allowance is made on articles which exceed twelve diameters in length than in the case of shorter jobs. This is to save lathe work.

A job over twelve diameters long will spring considerably under a good cut, and there is a possibility of bends making their appearance. The largest possible allowance is therefore made on this work, so that the turner need not waste time which would be taken in producing articles more nearly parallel and straight.

Then again, a distinction is made between rough-turned work and that which is produced by a fine feed or made on turret lathes with a box tool.

smooth finish so as to allow regular penetration of the casing compound, therefore the allowance specified for smooth work over twelve diameters long should be used for care-hardened work whatever its length. If such work is hollow it may distort after quenching, therefore great care must be exercised in hardening, as the allowance above specified cannot be exceeded or the hard skin would be entirely removed in grinding to size.

The allowance for carbon and high-speed steel work which is hardened will be the same as that provided for soft work, as any distortion which occurs must be corrected in the straightening press before grinding.

Internal work, which is dealt with by the lower portion of the chart is divided into three classes as follows:

1. Mild steel case-hardened.
2. Carbon or high-speed steel hardened.
3. Soft work, whether steel, cast iron or bronze.

Hardened and case-hardened work in which the hole is less than half an inch in diameter should, as shown in the chart, be bored or reamed to standard size, as there will be a sufficient shrinkage when the quenching takes place to provide a grinding allowance. It will be noted that the amount allowed in case-hardened work increases very rapidly up to 6-in. dia.; this is to allow for distortion in hardening. Above this size the increase is slow, and care should be taken to avoid excessive distortion as no larger allowance can be made, otherwise the hard skin would be removed by the grinding operation. In determining the allowance for soft work it should be remembered that the class of finish given to the hole will decide whether the high or low limit should be worked to. Thus, in holes which are rough drilled or bored the allowance should approach the maximum, whilst in reamed holes the minimum allowance should be left.—"Herbert's Monthly."

EXTERNAL GRINDING.

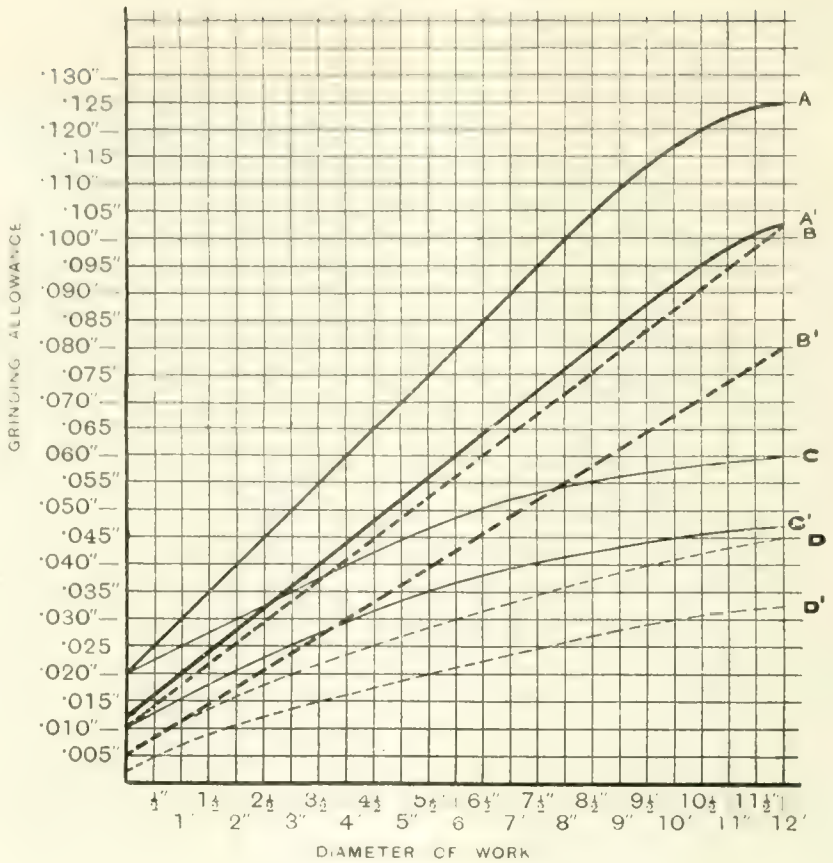


CHART FOR EXTERNAL GRINDING ALLOWANCE.

Curves A & A¹ show maximum and minimum amounts to be left on the diameter of rough turned work over 12 diameters long.

Curves B & B¹ show maximum and minimum amounts to be left on the diameter of rough turned work under 12 diameters long.

Curves C & C¹ show maximum and minimum amounts to be left on diameter of smooth turned and bar lathe work over 12 diameters long.

Curves D & D¹ show maximum and minimum amounts to be left on diameters of smooth turned and bar lathe work under 12 diameters long.

By rough turned is meant work having coarse traverse marks, the measurements being taken on the top of the ridges. The following are the finest feeds which should be employed:—

| | |
|---|---|
| For work up to 2 in. dia. | 30 per inch |
| For work from 2 in. to 4 in. dia. | 20 per inch |
| For work from 4 in. to 8 in. dia. | 16 per inch |
| For work from 8 in. to 12 in. dia. | 8 per inch |

INTERNAL GRINDING.

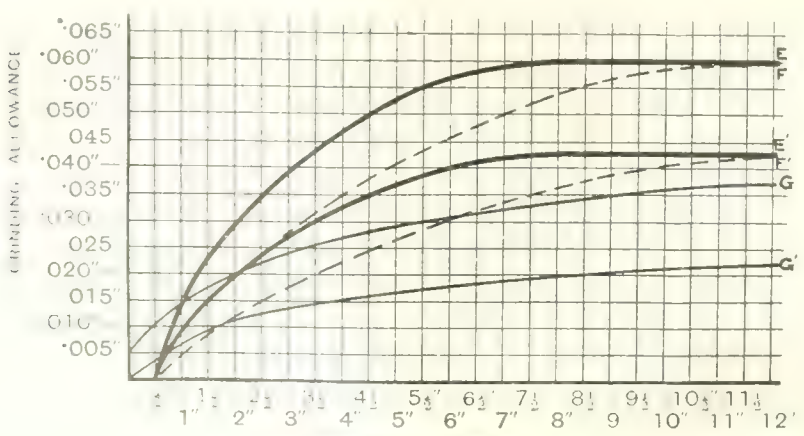

CHART FOR INTERNAL GRINDING ALLOWANCE

Case hardened work is an exception, because the finish must be fairly smooth to allow regular penetration of the casing compound. Use Curves C & C¹ for all such work.

Curves E & E¹ show maximum and minimum amounts to be left in the bore of mild steel work that is to be case hardened before grinding.

Curves F & F¹ show maximum and minimum amounts to be left in the bore or carbon or high-speed steel work that is to be hardened before grinding.

Curves G & G¹ show maximum and minimum amounts to be left in the bore of soft work, whether steel, cast iron, or brass.

# Heat Treatment of Large Forgings: Methods and Apparatus-I

By H. H. Ashdown.*

*Some [illegible] into the paper on [illegible] heat treating, and [illegible] the methods employed and the [illegible] on the subject with particular [illegible] problems in itself and must be [illegible] in the order. The present [illegible] with the [illegible] methods [illegible] the [illegible] of the [illegible] to [illegible]*

So much has already been said and written concerning the heat treatment of steels, and one finds in all works, where any form of treatment is practised, so many authorities on this subject, that the lay mind would think that perfection in every possible way had been achieved. Further, with the perfect system of pyrometric control now installed in most of our steel works, the impression gained is the impossibility of failures to occur due to incorrect treatment.

The heat treatment of steel may cover a very wide field, but the heat treatment of steel forgings suggests at once the impression of handling materials both in quantity and in the mass. To give a broad sense of comparison, one might compare the treatment of a piece of a piece of 1-inch round steel with a forging weighing some 60 tons, or a furnace full of forgings in the aggregate weighing 200 tons—this being on a parallel with the vastly different conditions ruling when casting ingots of a few cwts. in weight and those weighing 100 tons. From experimental evidence and casual observation it is quite evident that there is still much wanting in this direction, in spite of our greatly advanced knowledge and high attainments in research on this subject of recent years.

The author has been closely associated with the investigation, manufacture, and treatment of steels in all their phases for the past twenty-five years, and for the greater part of that period has dealt with them in a commercial sense. His proposal therefore is to treat this matter in as practical a way as possible, dealing with the subject from a commercial or works point of view rather than approaching it as a subject of research. Having thus mapped out the course of the paper, it has been decided to exclude, as far as possible, technical terms relative to structural conditions, and in the subsequent discussion to evade such technical references, the nomenclature of metallography being, generally speaking, more confusing than helpful to the practical man.

In order to introduce and prove the value of metallography in the works, it is expedient to submit photomicrographs together with some form of practical illustration, an example of which is shown in Fig. 1, which shows at sight the fundamental principles underlying a moderately careful treatment, and then to compare their relative comparative strengths with that of bricks and mortar and concrete. It will, of course, be appreciated that these protomicrographs are strictly comparative, each being of 100 magnifications. At the outset it is suggested that the greater percentage of failures occurring is not so much due to the lack of necessary scientific knowledge, but from the want of knowing how to apply that knowledge in works practice, and also in a large measure from the lack of observation generally, when forgings are subjected to heat treatment.

FIG. 1.—TENSILE AND BENDING TESTS OF STEEL FORGINGS WITH PHOTO MICROGRAPHS MAGNIFIED 100 DIAMETERS.

A. Forged and oil treated tensile, 51.5; elongation 16.6; reduction 17; bending 10.
B. After correct heat treatment. Tensile 50.6; elongation 16.6; reduction 24.1; bending 180°.

FIG. 2.—MISCELLANEOUS FORGINGS IN THE FURNACE ILLUSTRATING THE USE OF PYROMETERS.

The rough outline sketch of a furnace about 8 feet by 10 feet by 100 feet long, Fig. 2, contains miscellaneous forgings such as are now comparatively common in big commercial steel works. These furnaces are periodically charged up with forgings of all descriptions, say, for example, heavy gun forgings, marine shafting, turbine shafting, and the like, possibly amounting to 150 tons in the aggregate. In the first place they are heated to a predetermined temperature. Annealing temperatures vary greatly, from anything between 650 deg. C (1,200 deg. F.), and 927 deg. C. (1,700 deg. F.), and the results obtained from the forging naturally vary accordingly. These temperatures are questioned at times, and one is told that there is little need to trouble, as the forgings as a rule pass test. That may be so, but unfortunately one hears from time to time of forgings, machine parts of all descriptions, breaking down prematurely, due to fatigue. Fatigue compares very favorably with a medical practitioner's "influenza"; it temporarily covers a very wide field of inherent troubles. The cause of the so-called fatigue could often be located at the manufacturer's works before such forgings were put into service.

In Figs. 3 and 4, are seen various types of structures from similar steels in the so-called annealed condition. The author prefers not to suggest anything that might be embraced in already stringent specifications, but this condition of things is doubtless a matter that must receive closer attention in the immediate future. The temperature of 650 deg. C. (1,200 deg. F.) is, as all know, well under the change-point of steels in general, and unless that critical temperature is exceeded comparatively little change is effected in the structural condition. A forging which has been finished at a high temperature, or parts which have been raised to a forging heat and have received little or no subsequent work, on cooling retain a very coarse structure.

To make this point more clear, an example of two operations in the forging of a marine shaft, Fig. 5, is submitted

*A paper read before the Institute of Mechanical Engineers.

**Sir W. G. Armstrong Whitworth & Co., Newcastle-on-Tyne, England.

...withdrawing the already forged billet A from the furnace, the amount of work done on B is performed. Portion B is overheated, but in order to heat up portion $B_1$ for the subsequent forging operation, portion of $B_1$ must also be included in the furnace, and this naturally ...subjected to a prolonged forging heat, subsequently receiving little or no work upon it. The structural condition of this portion of such a shaft may not be unlike that of an unannealed steel casting, an example of the structure be-...description came before the author's notice some little time ago. The forging in question was a double intermediate shaft which actually cracked in the lathe during the turning operation; and, within the writer's knowledge, this is by no means an isolated case. The shaft in question was cut through this defective area, and tests taken in the immediate neighborhood gave the results shown in the illustration.

The shaft was then subjected to a prescribed heat treatment, and the results of the test, together with the microstructure, are given side by side for comparison in Fig. 8. This regrettable feature applies not only to large forgings, but equally so the whole way down the scale, even to drop stampings. It is not the intention to name any particular forgings of which examples are given, nor their source of manufacture; suffice it to be said that it has been my privilege to visit many large steel works both at home and abroad.

By way of an example of a comparatively small forging, a special type of heavy bolt was made by heating to forging temperature for their full length pieces of round bars and "upsetting" a portion to form the head as shown in Fig. 7. These forgings were subsequently normalized (this in the the author's opinion is a very vague term), at 677 deg. C. (1,250 deg. F.); but when such bolts were subjected to a shock test, it was by no means uncommon for the head to shell off. The reason for this will be readily understood when one examines what had taken place in the forging operation; the only portion which had received any work was the material forming the head, and where this adjoined the body one had two entirely different structures.

Although Fig. 9 was not taken from this particular type of forging, it will show the great contrast in adjoining structures when forgings are finished at high temperatures and are not correctly subsequently heat-treated. Now, after these forgings received a proper heat

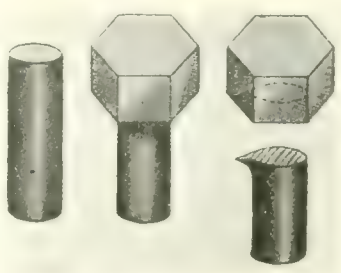

FIG. 7. HEAVY BOLT BROKEN UNDER SHOCK TEST

treatment, a uniformity in structure was obtained together with the disappearance of any further shelling of the head when subjected to the same repeated shock stresses.

A misconception more or less common in heat treatment of steels is that full advantage can be taken of the initial forging heat, and that forgings or stampings finished at a high temperature will, on cooling, regain a fine structural condition. This is entirely wrong, and if it is desired to obtain the best normal structural condition, the heat in such forgings must be allowed first to fall below its recalescence temperature and then reheated somewhat above its calescence temperature and preferably cooled in air.

Actual size. Photo-micrograph on junction line. Magnified less than 100 diameters.

FIG. 1. ETCHED PIECE OF STEEL.

With regard to high-temperature annealing and high-temperature quenching for hardening, it is generally known that as soon as one has reasonably passed the calescence temperature of the particular steel under observation, a refining in the structure will result therefrom, and also that, practically speaking, the maximum hardness of the steel can be effected by quenching from this temperature. It is also known that after exceeding reasonable limits of this temperature, in conjunction with the time factor, the coarse structure redevelops, and develops more rapidly the higher the temperature. A most important point often overlooked is the comparatively long time taken to raise forgings of appreciable size or in quantity to these elevated temperatures, and it is during this unnecessary period, which is costly in both fuel and labor, that the forgings are caused to deteriorate rapidly. Some of the big industrial institutions are favorable to high-temperature quenching, and it would be interesting to learn their reasons for this. The author has never found it necessary to exceed, either for annealing or quenching, when treating forgings in the mass, a temperature of 843 deg. C. (1,550 deg. F.), and has had no reason to regret the results obtained.

Reference has already been made to the lack of observation during the process of annealing. Let us return once again to the annealing furnace, and give it a few moments' attention whilst the small sections have attained this heat, heat is being gradually taken up by the forgings. What does one notice? Naturally, the smaller or projecting sections become heated long before the larger or depressed portions. Assuming now, for the sake of argument, that the predetermined temperature is to be 870 deg. C. (1,600 deg. F.), it is easy to understand that if in a short time the it will be a considerable period before the larger sections acquire this same temperature, and, whilst the process of uniformity is being obtained, the smaller sections have been most unduly heated. Such points as these are often the fruitful cause of many failures, and they, unfortunately, are points which are frequently overlooked, and it is here where a good furnaceman becomes invaluable. The author has found it an exceedingly good plan first to get a good initial soaking heat through the forgings, just under the "change-point," say about 704 deg. C. (1,300 deg. F.), where, if at all, little harm is done by a long heating, and then gradually to raise the whole of the forgings to the predetermined temperature.

(To be continued.)

## SCIENCE AND INDUSTRY

By M. L.

THE formation in Sheffield of the first Association of Metallurgists and the Metallurgical Chemists means more than appears on the surface. It is perfectly true that the importance of applied science in the national organization has long been recognized by all thinking men in the industrial world, and that the alliance of the two has achieved notable triumphs, but whilst one of the primary objects of the new association is, very naturally, to make that alliance more effective and to lead to a broadened outlook and a freshening of ideas, it stands, if we mistake not, for something more.

The metallurgist and the metallurgical chemist should be inseparable allies. The path they together tread is broadening to a degree little anticipated, probably, before the war, and the return of peace will quicken not retard this development —a fact that is every day becoming better understood. There are great possibilities in front of the iron and steel and kindred industries, but a full realization of them may only be secured by the maintenance of a high scientific standard and more intimate contact between the scientist and the official responsible for the actual operations in the works.

Never before has the importance of the work's laboratory been so generally recognized, with the result that the number of firms adding a staff of chemists to their establishments is rapidly increasing. But those laboratories cannot be staffed at will, especially in these days of military demands. Metallurgical chemists are not kept hanging on pegs behind the door of a labor exchange The danger is, therefore, that through the present urgent request for such men there may be a lowering of the standard of efficiency demanded in normal times, with consequent injury to the reputation of a profession that ranks high in the list. This, we fancy, is where the association seeks to come in. The only entry to it is ability, but that condition is to be insisted upon. Nevertheless, provision is to be made for a student section, which apparently will be open to every young fellow of the right stamp. The aim of the association is to lift up, to encourage study and healthy ambition, and to assist in the development of the application of science to the industries with which its members are associated.

The association will work in harmony with the Institute of Chemistry, five Fellows of which, we observe, have accepted seats on its council, and with the recently-constituted British Association of Chemists. We regard it as one of the most important developments of the Sheffield iron and steel industry and look for the formation of similar associations in other steel centres with a federation of the whole.

## MANY VOLUNTEER SHIPBUILDERS REGISTER IN UNITED STATES

WITH figures for many States missing, returns received by the United States Public Service Reserve of the Department of Labor show that 200,000 mechanics have registered as shipyard volunteers for future service in the shipyards of the country. Several States have exceeded their quotas, but they are continuing enrollments. Illinois, which more than a week ago reached its quota of 23,662, is continuing to register men suitable for work in the yards and now has more than 29,000 enrolled. New York City has passed the 20,000 mark, which was its quota, and is enrolling at an uninterrupted rate. Through the New York City office of the United States Employment Service, of which the Public Service Reserve is the "recruiting" division, has sent a number of the volunteers to yards in that section and to Hog Island, at Philadelphia.

California last week passed its quota of 11,310, the reserve officials said. Oregon went more than 400 above its quota of 3,204, and the District of Columbia has recruited more shipbuilders than were expected of it. Minnesota, Nebraska, Iowa, and New Hampshire are enrolling at a rapid rate.

## CONSERVATION OF FUEL

[illegible] that the Canadian factories economize. They [illegible] intelligent people are wondering where it will all end and at the same time these people are doing everything they can in their own homes to try and save coal. It is not a question of how many tons can be saved but of how many shovelfuls each individual householder can conserve. A few small details such as keeping the building at a temperature just warm enough and no warmer, say 65 degrees Fah., which will be suffcient, and will result in better health. Double windows, etc., can be fitted better and the furnace fittings can be made tighter and the pipes insulated, while the flues and chimneys should be kept clean.

Are the manufacturers paying as much attention to details as they might?

It seems that there are many ways of effecting economies such as selecting the firemen with a view of obtaining conscientious, intelligent men who will follow instructions and not fire irregularly—light and heavy—and who will distribute the coal evenly. Railway officials, who have spent considerable time on the general fuel situation have found that firing a boiler is a job which requires intelligence if the maximum efficiency is to be maintained because, at best, burning coal is wasteful. The boiler settings should be checked, the draft and grate area considered and the flues should be thoroughly cleaned and made free from scale without waiting for the boiler inspector to come around as these details are just as important as shovelling in the coal. How many of the manufacturers have been asked by the fuel controller to have these details attended to? Not very many. It is not the average householder who is wasteful but it is the factories and hotels.

### Plant Economies

It is a good idea to have a recording thermometer showing the room temperatures at all times and it will be noticed how soon the firemen will become interested and the fuel consumption will drop. Conditions have existed where a recording thermometer reduced the fuel consumption over 30 per cent. and this plant was an average factory. It should be borne in mind that sudden changes in the firing should not be made if the maximum results are to be obtained but any changes should be foreseen and gradually made.

Formerly it was possible to specify the brand of coal and to see that the quality was kept up by checking the various ingredients but now the consumer is obliged to take anything he can get, with the result that there is little economy obtained from selecting the different grades.

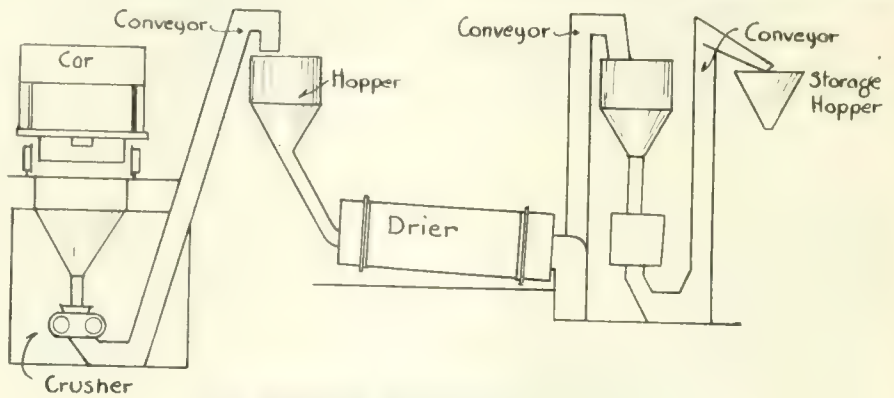
For the small plant, fuel oil is probably cheaper as it possible to control the heat with such ease that slight variations in atmospheric temperature can be allowed for and advantage taken of the mild spells by shutting down periodically or altogether. This flexibility or operation has made it possible to effect considerable saving and on account of the possibility of regulating the fuel and air with precision more perfect combustion is obtained.

The first cost of the oil compares favorably with the increased price of coal, and actual results have shown it is preferable for the small plant. No very radical changes are necessary to alter the equipment except in the drafts and brick work. The only change to the grates is the reducing of the volume of air coming down through by making a checker work of brick. A little experimenting with the different types of furnaces will very easily establish the correct area of combustion chamber, etc. The extra cost for piping tanks, etc., is quite within reason.

### Powdered Coal

The use of powdered coal has many advantages over the ordinary method of burning coal and is far more economical as every particle of coal is surrounded with the necessary amount of air to insure complete combustion.

Formerly the specifications for the quality of the coal to be used in pulverizing coal plants were rather exacting but up-to-date practice shows that if due care is given to the operation of a powdered coal plant quite a lot of latitude may be given and the results will not be impaired. Coal containing 28 per cent. volatile combustible matter is being used successfully and even poorer grades may be used. Except in the case of open hearth, puddling of bushelling furnaces, where the composition of the material being worked would be affected sulphur is of little importance, and even in these cases it is a debatable point as to whether the composition would be affected enough to matter. Moisture is absorbed very rapidly by powdered coal; it may amount to 0.01 per cent. per minute for a definite period, after which the absorption rate will diminish. Like fuel oil, if the air is preheated to say 500 degrees Fah., a saving of 20 per cent. may be effected. A simple way of accomplishing this is to pass a few lengths of blast pipe through a chamber heated by waste gases. The feed control and burner sizes are important factors in burning powdered coal. A few typical analyses of coal used in the powdered form are given:



COAL HANDLING AND PULVERIZING PLANT.

| | % | % | % |
|---|---|---|---|
| Volatile combustible matter | 33.2 | 23.55 | 35.50 |
| Fixed carbon | 56.07 | 67.3 | 55.15 |
| Water | 1.12 | 0.35 | 0.40 |
| Ash | 9.61 | 8.08 | 8.95 |
| Sulphur | 1.00 | 2.04 | 1.51 |

An idea of what a pulverized coal plant is like may be gained from the accompanying illustration which shows a permanent installation.

The total equipment necessary for pulverizing, handling, drying and milling 2½ tons per hour, which is sufficient for five forge furnaces, would cost around $60,000.

### Equipment Necessary

The coal is dumped from the car into a steel car hopper located at the end of the milling building and in a concrete pit under the track. The hopper is made of ⅜-inch steel plates, and is 8x8x6 ft. deep, with sides sloping to a square opening where the feeding conveyor is located. A slide gate can be used to control the feed. The conveyor is a 6-inch standard horizontal, U shape, and conveys the coal from the hopper to the milling room. A crusher 20 x 24 in., with two cast iron toothed rolls is capable of crushing lumps from 8 inches

to a suitable size for the pulverizer, which is about ¾ inch. The rolls are provided with a spring release in case some foreign substance should get into the crusher. From the crusher there is a boot-legged conveyor to the crushed coal bin. This conveyor is of the bucket type with 35 ft. centers and is covered to make it dust proof.

An arrangement is provided to distribute the coal uniformly in the coal bin which has a capacity of 60 tons and is reinforced 5-16 in. steel plates. The bottom is hoppered and arranged to connect to a conveyor which feeds the drier. The drier should be in a separate building on account of the liability of explosions. The drier reduces the moisture from 7½ per cent. to 1 per cent. It is composed of two shells made of heavy steel plate and having butt joints with inside lapping strips. The outer shell rotates at a speed of 6 r.p.m. and the inner shell connects with the furnace, the hot gases passing through it and at the end are carried away by a fan. The discharge goes to a dust collector which catches the finely divided particles of coal taken up during the passage through the drier. The shell of the drier is 48 in. x 20 ft. long, supported by rollers operated by spur gearing. The whole is placed at an angle and the outer shell contains helical vanes which convey the coal from one end to the other. At the firing end grate bars and ash pit doors for hand firing are arranged. The combustion chamber is lined with fire brick as is also the steel flue which connects with the drier shell.

The exhauster is belt-driven and of the centrifugal type. Provision can be made to deflect the hot gases from the drier when it is not in use by providing an auxiliary pipe connected to the fire box. The dust collector can be of the cyclone type. From the drier the coal is taken to a bin which is connected to the pulverizing mill by a conveyor. A 33-inch belt-driven vertical type with automatic feed and with a screen separator will take care of 2½ tons per hour. The pulverized coal is conveyed to a storage. Coal is taken as required to the furnaces by screw conveyors which lubricate themselves with the coal.

It is important that the pulverizing be fine enough so that the product will have at least 90 to 95 per cent. passing through a 100 mesh sieve. A relatively small air pressure is used by most people, this varies from 1 to 6 ounces, but some use as high as 10 to 15 ounces and have the mixture rotated in a mixing drum which tends to make a more thorough mixture instead of throwing the suspended coal across the furnace, and in some cases having it unburned. Some concerns use slack coal, and by first passing over a trommel the large material is segregated and the small coal sent to the pulverizer. The large coal is sent to the power house and consumed.

## WATERPROOF WHITEWASH

By B. M.

A NEW mixture has been recently introduced producing a waterproof whitewash. The influence of bichromate of potash on glue, rendering it insoluble when once dry, is made use of as follows: Dissolve 1 pound of glue in 3½ pints of water. Dissolve 3 ounces of bichromate of potash in ½ pint of hot water, and mix the two solutions. Then add enough of whiting to produce the right consistency, and apply in the usual manner. The action of the sun on the potash and glue render them insoluble and waterproof. The mixture adheres firmly to slate, glass, metal, masonry and plaster. Authorities seem to vary on the subject of the amount of bichromate of potash required to make glue insoluble; one-fortieth by weight is considered by many to suffice, in which case one ounce would suffice for 2½ pounds of glue. Again, the weight of whiting that the above amount would hold together and bind to any surface should not be more than could be carried in 4 pints or 2 quarts of water. This is a matter that the experimenter must ascertain for himself, on a small scale preferably.

Glue dissolved in skim milk becomes insoluble when dry and might serve the purpose, and 1½ pounds of the cheapest sweet oil added to 8½ pounds of quicklime while slaking makes a well known insoluble coating that is available everywhere in India. The pores of the most porous plaster are readily filled with good limewash, and, if it is waterproof, one coat well applied should protect the plaster against saturation. A thick porous wall takes a little longer to penetrate than a thin one, but it also takes so much longer to dry. An impervious outer coating renders them both equal.

The need for cheap waterproof coatings in India is brought to mind in each succeeding rainy season when the monsoon wind drives the water through our very porous walls. Although a damp atmosphere at a temperature of about 80 degrees has no bad effect on public health it is most injurious to household goods and to merchandise of many kinds, besides being destructive to buildings.

## PRODUCTION, OPERATION AND DESIGN

By M. M.

THE two main divisions in engineering activity may be described as production and operation. It is, perhaps difficult to say where one ends and the other begins sometimes, but the classification and recognition of the division is convenient. The two sections are independent in a very real sense; an engineer concerned mainly with operation must be qualified, have experience of production, although numbers of first class men engaged in production have had but scant experience of operation. The complementary division making a trinity of the engineering world is that of design. Lacking experience in any single division the individual cannot expect to be an all-round man. There are draughtsmen, for instance, lacking experience in either of the other fields, operators and producers without knowledge of the problems of design.

There is this fact certain that the severest critic of design is the operating engineer. The producer is quick to point out the difficulties of production, while the designer and operator both are concerned with the utility of the finished mechanism. It is operation, the one test of fitness, durability and purpose, which influences design in the long run. The accumulated evidence of experience which time alone affords alters details proved troublesome, and sometimes condemns product, leading to eventual redesign.

The older school of mechanics, whose output was smaller, were reared upon the finished purpose of the job; to-day production is apart from purpose and is sometimes at the sacrifice of ease of operation. It is certainly a temptation to get output at the expense of the finished job. Assembly has taken the place of erection and the small adjustments once needed, which often meant much to the individual job, are out of date.

There should be a co-ordinator of divided activity or, more properly a works tribunal, which should return a member from each division to thrash out differences. One firm leaves the adjustments to the tester, another makes limits coarser to cut out any individual adjustment needed. Manufacture and engineering skill are apart from each other although the former depends initially upon the latter.

Certainly the designer should have had previous experience in production and operation; if he has it cuts out lots of trouble in the shop. Failing this there is the expedient of the production man, with unspecified duties and the power of unlimited criticism to co-ordinate the departmental activity. Neither the designer nor the operating engineer can ever be a specialist in any narrow sense, still there is yet room for closer co-ordination in many large concerns. Whatever the system of organization, one live man is worth many card indexes, and a referee with power to settle each case as it arises, who can, with tact and firmness, bring production, operation and design into line, seems advisable. Obviously the selected individual must have had experience in all three capacities.

## METHODS OF METAL FUSION

By O. C.

DURING the progress of the world-war the scientific welder has risen to the heights of fame, for he has grasped with both hands the opportunities given him to make good in a profession which hitherto had never come fully into its own. The making of permanent metallic joints had been practised in one form or another from the remote days when the ancient craftsman pursued his task by hammering pieces of metal together which had been previously raised to welding heat. The success of the method depended largely on the skill of the mechanic, particularly as to the exactness of his observations of temperature and the conditions of the surfaces of the metal to be joined.

higher form known by the name of the oxy-acetylene process, which is the last word in this industry. The tensile strength of soft solder is extremely low; it has a much lower strength than the metals to be joined and is principally used for tin-plates, zinc, lead and sometimes brass or copper, wherever no serious strain is encountered. Riveting, brazing welding by water-gas, electric welding and thermit welding are all more or less in practice in various directions, whilst all have their respective uses. These systems are not in general use to anything like the extent of the oxy-acteylene method.

### Processes

Thermit-welding is a process specially applicable for the joining of iron and mild steel of great thickness, and has been much used for the welding of rails and the repair of large steel castings. Perhaps its greatest use has been in connection with the welding of tramway joints; but there can be little doubt that this process is destined to be much more largely utilized than heretofore.

The term "autogenous" is usually applied to welding joints by the fusion of metal in action by the flames of the blowpipe. Generally speaking, however, it is more particularly applied to the oxy-acetylene process—most commonly employed in the use of oxy-acetylene welding, which is of comparative recent date. The first blowpipes working with acetylene under pressure were made in 1901 by MM. Fouche and Picard, but since then the process has been subject to extremely rapid strides of progress and its great success has given rise to birth of other processes.

In starting to weld, the operator has one main object—to succeed in uniting metal in such a manner that its properties are not weakened or destroyed. In constructional work certain joints can only be satisfactorily made by autogenous welding, from the industrial point of view, such as in the case of certain branches to tubes, pieces for machines, aeroplanes and other special devices.

### Limitations

Considered in the light of a process whose chief function is to restore to use machinery which has broken down under the stress or strain of use or in accident there is nothing in sight to approach it either in efficiency or in economy. It is a process which, used by capable well-trained workmen with a good knowledge of the principles involved, has no rival for the perfect repair of broken metal. There are cases where the application of autogenous welding does not give results, as in the joining of a thick portion to a thin piece where it is impossible to avoid the effects of expansion; but, obviously, no expert would ever set out to achieve results which he knew from the first were unattainable. For the repair of articles in cast iron, bronze and alloys of aluminum it is often indispensable to have the pre-heating of the article followed, after welding, by a slow-cooling in order to avoid the effects of expansion and contraction.

The successful welder should naturally understand the physical and chemical properties of the products which he uses, and which can leave such effects that the strength and solidity of the joint he makes are seriously compromised. It is necessary that he should know the value of the different metals and alloys which he may have to join and the melting point of each. It is of prime importance that he study fully the questions of expansion and contraction. If the temperature of a metallic body is raised progressively throughout the mass, or is lowered in the same way, the phenomena of expansion generally has no bad effects such as breaking or deformation, since its action is uniform. This is not so when the heat is applied at one point or part of the body. The metal tries to expand at this place, and since no force can stop it, it breaks or deforms from that which opposes it. It is necessary to obviate these effects, and in autogenous welding there are numerous devices at the disposal of the experienced operator such as allow for free play in preparing the work of warming the whole piece simultaneously, heating opposing parts, artificial breaking, and the sprinkling of common water in parts to create a force of contraction to counterbalance that of expansion. The method of treatment varies with each metal, and each piece according to shape and dimensions. The effects of expansion are now more or less due to the inferior character of the metal.

It is important to note that the tenacity of various metals, however strong, becomes practically nil when raised to a temperature which is still below the melting point. Breaks on cooling are much more common in these matters than in others, and one is able to avoid them on knowing that at a certain temperature their tenacity diminishes very rapidly. The texture of the metal considerably influences the mechanical properties.

### Material Used

Another point which cannot safely be overlooked is the necessity of adding special metals in order to produce the perfect weld. The principal quality which one should require of the metal to be added is that it should be as pure as possible. Metal of the same nature could be added when there is no risk of lowering the quality of the parts to be joined, but this is not generally the case, and the addition to the line of welding a metal which is purer and better improves the holding power of the joint.

Autogenous welding can be applied advantageously in multitudes of repairs in iron and steel. It is often the only process by which fractured, deformed or worn-out parts can be re-created. The application of the process to the manufacture of material for war purposes and to the reconstruction of derelict plants during these last years of abnormal activity in Britain has been on an abnormal scale, and it has nowhere as yet been possible to form even an approximate idea of the extent to which the process has been tried. One may, however, glimpse something of the utility of autogenous welding when it is learned that one firm alone is reported to have dealt with something like ten thousand fractured machines per annum. Great strides have been made by British engineers in this industry, some branches of which Germany had made particularly her own, principally in the method of early apprenticing her youth and specially training them for a long period for the work involved.

There is nothing mechanical or slipshod about the process. It demands the very highest skill and a special course of study if the operator is ever to become a master craftsman whose work can be depended upon. Such is the nature of the business that the repaired part may be made to appear to the eye a perfect model of the original machine and yet prove wholly illusory in operation and fail to stand up to its work. Thus, it need hardly be said, it is not necessarily due to design or a desire to deceive. It simply means that the operator, in his ignorance, has failed to take account of one or other of the vital factors essential to complete success. Firms of the highest repute in the trade, knowing how deceptive outside appearances may prove, enforce the most rigid tests, and no repaired unit is allowed to leave the works until it emerges successfully from the ordeal. It not infrequently happens that the weld proves stronger than the rest of the machine, so much so that ordinary cutting tools altogether fail to make an impression upon the superfluous metal.

As the art of welding becomes better known, so its uses extend. To-day thousands of welders are engaged in helping to turn out wonderful machines and devices, from which perhaps other yet more wonderful things may be evolved.

---

THERE has recently appeared on the commercial market an anti-friction alloy which is made by impregnating praphite with molten metal under hydraulic pressure. By this method the high lubricating nature of graphite is combined with the mechanical strength of the metal used, and the resulting alloy has been found to possess many desirable properties which tend to give a very promising future in the realm of mechanics. Whilst bearings made of this substance must of necessity be restricted to a limited size their manufacture forms a practical and noteworthy achievement in the great field of scientific endeavor. This substance has become known as graphalloy.

---

A NEW high-speed steel has been patented by a German company. The patent specification states that the steel shall contain carbon, 1.2 per cent.; manganese, 1.2 per cent.; silicon, from 0.1 to 0.3 per cent.; chromium, from 3 to 10 per cent., and cobalt, 1.5 per cent. This material is said by the inventors to be an improvement upon a similar steel which they patented last year containing molybdenum. In its manufacture the molybdenum is omitted, and the percentage of manganese and chromium is increased.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

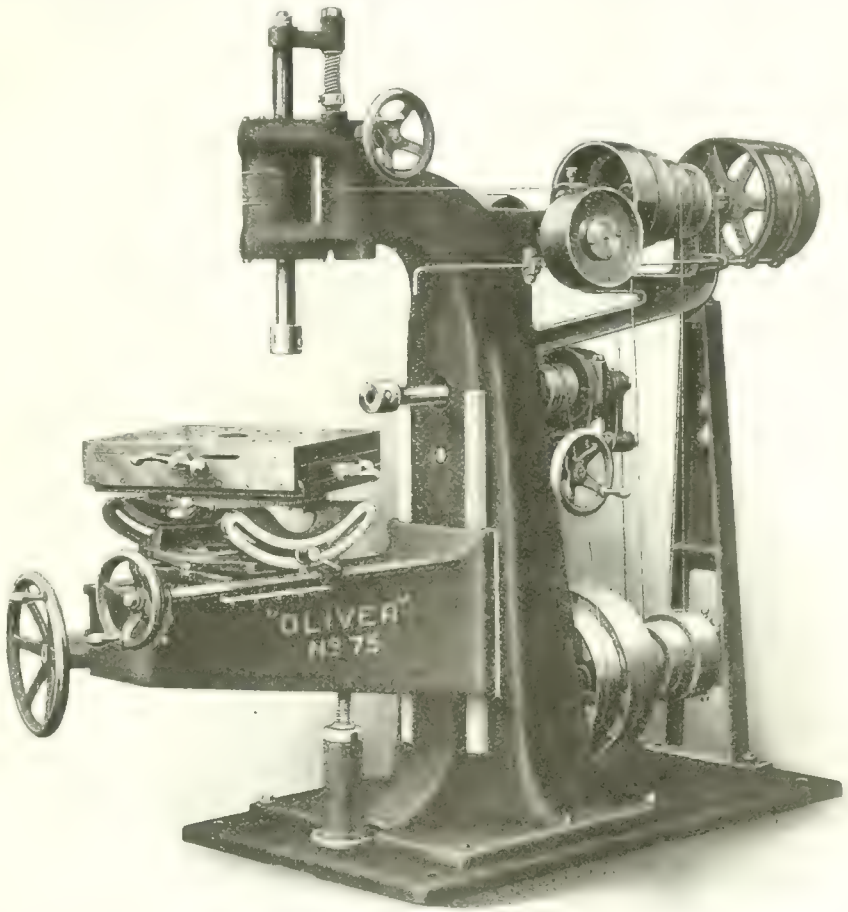
## WOOD MILLING MACHINE FOR THE PATTERN SHOP

THE machine illustrated in the accompanying engravings has been developed by the Oliver Machinery Co. of Grand Rapids, Mich., to eliminate much of the tedious pattern shop work formerly done by hand, and it is capable of as wide a range of operations as the milling machine forming a part of every tool room.

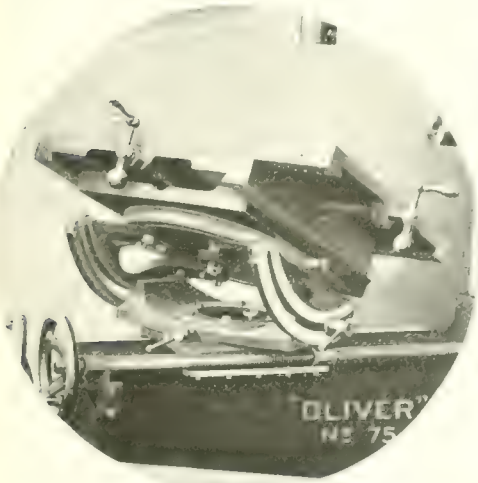
By the use of a similar dividing head gear teeth may be cut and work accurately indexed in any desired manner. Core boxes of any section may be routed out.

The table is 20 ins. square and is divided accurately in 1 in. squares by etched lines and tapped at convenient locations for attaching general purpose clamps. A 3-in. removable centering disk permits boring below the line of table without injury to boring tools. For circular work where the work revolves, two centering plugs ½ in. and 1 in. diameter respectively are furnished. The table swivels on ball bearings, full 360 degrees and at 90 degree points a positive lock operates to locate these important table positions correctly. The table tilts 45 degrees in either direction and cross-feed of table is secured by screw and ball crank lever, which may be operated from either side of table. A positive centering device locates center directly over the ball-bearing swivel center for circular work. The cross feed travel is 12 inches.

The spindles are made from high-grade high carbon stock and are accurately ground. The spindle diameter is 1⅞ ins. in sleeve with a 3 in. head for receiving cutters with No. 4 Morse taper. Both the vertical and horizontal spindles are hollow to allow the draw in rods to safely hold the fly cutter holders in place. The vertical travel of spindle is 10 in., while the horizontal spindle has 11½ in. travel. Both spindles are controlled by handwheel and spiral gear acting on a double square thread screw of large diameter. A micrometer adjustment to both handwheels permits of very accurate control of the cutting tool. Each spindle control screw is provided with a knurled brass positive stop lock nut to insure cutting to given depth. The spindles slide easily in accurately bored pulley sleeves, the construction of which is such that no belt strain whatever is transmitted to the spindle. Distance of center of vertical spindle to the face of column is 18 in., and when in the highest position it is 24 ins. above the table. Center line of horizontal spindle is 14 ins. above table at the lowest position.



WOOD MILLING MACHINE—VIEW SHOWING FOUR SPEED COUNTERSHAFT BELT DRIVE



VIEW OF TABLE SHOWING COMPOUND CROSS SLIDES, DOUBLE SWIVEL AND METHOD OF TILTING

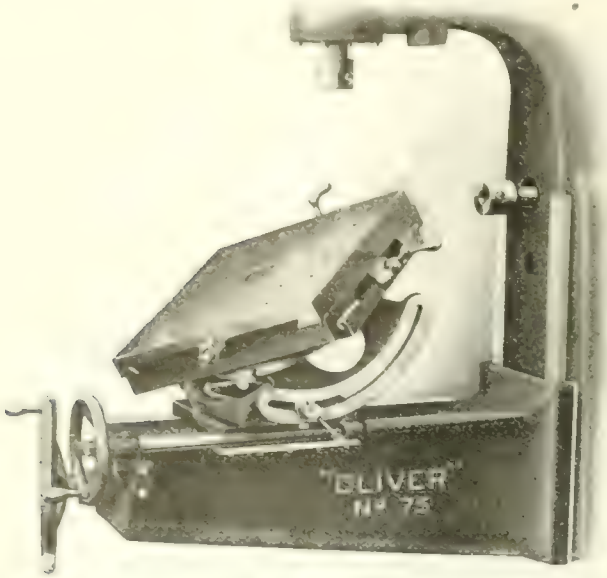
### Bearings

Both the vertical and horizontal spindles run on ball bearings of large diameter, allowing a maximum speed of 5,000 R. P. M. if desirable on certain work. The regular speeds of each spindle are 1,250, 2,000, 3,000 and 4,300 revs. per min. Idler pulleys are 10 in. diameter and 4 in. face, and are provided with ball bearings, thus eliminating all lubrication troubles of high speed loose pulleys. The countershaft bearings are of genuine babbitt as the slower speeds render ball bearings needless, and the loose driving pulley has a die cast white bronze bushing.

A box type knee is provided, closed on top to prevent chips interfering with the raising mechanism. Horizontal planed ways permit the table to travel to and from column a distance of 17 ins., a large square thread screw and handwheel giving rapid traverse. Additional support to the knee is rendered by a centrally located telescoping screw. An extra large handwheel operating this screw lowers and raises the knee for its 21 in. of vertical travel.

By using the vertical spindle work up to 19 ins. diameter may be turned by means of the revolving table. By centering the work on the table center plugs, work up to 28 ins. diameter may be turned by revolving work on table. By using horizontal spindle and revolving table, work up to 48 ins. diameter may be turned.

[illegible] spindle is used and the dividing head is tilted to suit. Two cutters are used, [illegible] front and one for the correct shape at the smaller end or back.



VIEW SHOWING TOP OF TABLE IN A TILTED ANGULAR POSITION

For spur gears one cutter only is necessary and no hand work is needed.

The machine may also be used upon soft white metal patterns in which case slower spindle speeds and proper cutters are required.

A very complete equipment of cutters is supplied and additional ones may readily be made or purchased at any time.

The scope of the work possible is realized when it is used for recessing [illegible] turning and boring, mortising and tenoning, and other pattern shop operations.

The machine can be fitted for either countershaft or motor drive and in the latter case a 5 h. p. motor is required.

## HIGH-DUTY 25-INCH LATHE

THE illustration shows a 25 in. double back-geared lathe fitted with semi quick change gears, built on a 10 ft. bed. This lathe is also built in the quick-change gear style and beds are available in from 10 to 20 ft. lengths.

The bed is made with heavy double wall cross girts, spaced two feet apart, forming a rigid construction. One large way is cast on the bed in front, and one small way on the back. The ways of the bed are cast with a 20 per cent. steel mixture, providing a very hard metal for the carriage bearing, thus the wear which takes place will largely be confined to the carriage where it will not imperil the accuracy of the alignment.

Large bearing surfaces are provided for the carriage, the front V being 3 ins. in width and the rear one 2½ ins. The carriage bridge is also of ample depth and is 10 ins. wide; the length of the carriage is 3 ft.

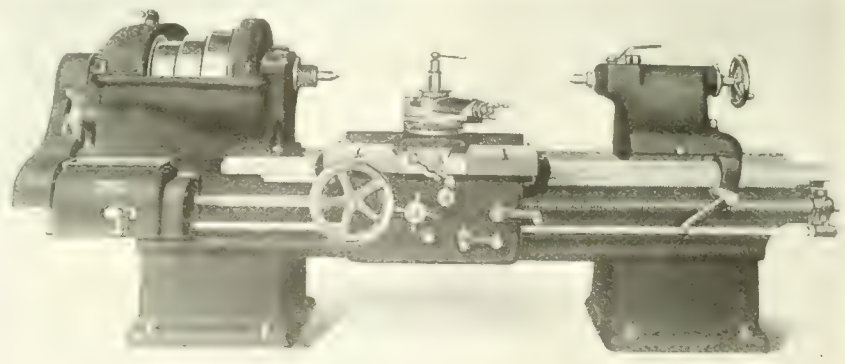
The compound rest is of a rigid design and the swivel is made completely circular. Full length tapered gibs are provided on both the cross and compound rest slides and are placed on the negative side where they will not receive the thrust due to tool pressure. The compound rest travel is 5 ins.

The tail stock spindle is 3 ins. in diameter and is provided with a positive clamping bolt.

The head stock is of the closed type with ample phosphor bronze boxes carrying the main spindle which is provided with a 2 3-16 in. hole.

A double apron is provided for the carriage giving double bearing to the gears and is grooved, pinned and bolted to the carriage. All the gears in the apron as well as those in the gear box are of steel.

The lead screw is made of 40 point carbon steel and is 1 11-16 ins. diameter. It is turned from ground shafting and is fitted with a two pitch thread. The quick change gear mechanism forms a complete unit mounted on the front of the machine. It provides a wide range of threads and feeds, all of which are listed on a reading index plate above the tumbler lever.



25-INCH DOUBLE BACK GEARED LATHE FITTED WITH SEMI-QUICK CHANGE GEARS

## A NEW END SUCTION CENTRIFUGAL PUMP

A NEW design of pump manufactured by the Wheeler Condenser and Engineering Co., Carteret, N.J., is illustrated herewith. This pump is of unusual interest because of the unusual position of the suction opening which is directly beneath and parallel to the end bearing. In this position it is out of the way, yet in a convenient place for the erection man for inspection and for upkeep.

This arrangement makes it possible to place a pumping unit in a room of small ground area—considerably smaller than where the suction end is opposite the outlet end as is the most common practice. In many cases this also facilitates the making of pipe connections, sometimes saving elbows and reducing the length of piping more or less.

The capacity of the particular pump shown is 45,000 gals. per min. against a head of 20 ft. The diameter of the outlet pipe is 36 inches. The speed of the pump is 240 r.p.m., and it is coupled by a 10 to 1 reduction gear to a steam turbine whose speed is 2,400 r.p.m.

## GAS FROM STRAW

THREE Prairie Provinces in Canada produce every year 20,000,000 tons of straw. This straw is at present regarded as having no commercial value and is burned. A retort has recently been invented in which the straw is carbonized and thus decomposed into combustible gases, tar, and ammonia. A number of experimental plants have been made, and it is hoped to get them installed on a certain number of farms during the present winter. The gas thus obtained will be utilized by the farmer for purposes of lighting, heating and power, thus producing useful fuels from hitherto waste material.

The retort is made out of highly refined steel and is designed in such a shape that the gases are removable in a very short time; it is also designed for individual use on the farm and is of small dimensions. It consists of three oval cylinders 7½ feet long, with a major axis of 24 inches and a minor axis of 6½ inches, the retort being enclosed in a metal or fire-brick casing with a fire box below. With a scrubber and a gasometer the total cost including installation is expected to be $500.

The straw, compressed into bales the size and shape of the retort, is placed in it, the doors are shut by a clasp, and straw burnt in the fireplace below. After the operation when straw is used as a fuel, a certain proportion of the gas given off is used for the purpose of the carbonizing process, about 30 per cent. of the total volume of the gas being

...ized in this way. The gas begins to come off at a temperature of 200 deg. C. and reaches its maximum between 500 and 600 deg. C. All the gas may be removed from the straw in about 30-45 minutes, rapidity of operation being an important factor from a commercial standpoint.

Each ton of straw produces between 11,000 and 12,000 cubic feet of gas, the quantity and the quality of gas varying slightly from different kinds of straw. The gas after generation in a retort passes into a scrubber (this being a metal cylinder 4 ft. long, by 18 or 20 ins. diameter), and thence into the gas container or flexible bag. If the gas is washed and purified so that the volume is reduced to 10,000 cubic feet, and, as stated above, 30 per cent. be utilized in carbonizing a ton of straw, there would be a surplus of 7,000 cubic feet for every ton of straw carbonized. The calorific value of straw gas is approximately 400 B. T. U.'s per cubic foot, so that one ton of straw would contain 1,000,000 B. T. U's. In this country we reckon that about 250 feet of coal gas is equal to one gallon of petrol, and the thermal value in B. T. U's of a gallon of petrol is calculated in the States at approximately 114,000. In this country we give it a higher value. Taking 7,000 cubic feet as the net output from a ton of straw, the heating value of the gas from that quantity of straw would be 2,800,000 B. T. U's, which can be taken as equivalent to 25 gallons of petrol.

From every ton of straw there is obtained between six to eight gallons of tar and ammoniacal liquors. This tar in its crude state would pay for the cost of baling the straw, which may be approximately put down as 4s. 6d. a ton, so that the farmer would have his fuel prepared ready for use at the cost of hauling it from the field to his retort. The carbon residue, of which there is about 600 pounds to a ton of straw, would find a ready sale as lamp-black.

As indicative of the importance of the scheme in the U. S. A. or Canada it may be mentioned that on the 20,000,000 acres which are cropped annually in the three Prairie Provinces of Western Canada only, assuming a yield of one ton of straw per acre, there is a total yield of straw of 20,000,000 tons. Allowing for washing and purifying and for the use of about 30 per cent. of the gas for the purpose of carbonizing the straw, there would be procurable 140,000,000,000 (one hundred and forty thousand million) cubic feet of gas, which may be taken to be equal to 22,000,000,000,000 (twenty-two million million) h.p. hours.

STEAM TURBINE DRIVEN CENTRIFUGAL PUMP WITH END SUCTION ADAPTED TO CONDENSER PRACTICE

## MAKING MATERIALS PAY

THERE seem to be solid grounds for believing that the German Government has selected its expedient for raising revenue to pay for the war. Without foregoing hopes of indemnities, it has accepted the certainty that large obligations will have to be met by taxation. Desperate diseases justify desperate remedies, and the Germans are not counting upon profits tax, income tax, or Customs duty to get them out of their difficulty. The favored remedy is more heroic, being nothing less than 30 per cent. impost upon raw materials. Metals, coal, oil and textile fibres of home production will be made to yield one-third of their value upon the average to the State, and in this way it is hoped to raise towards $500,000,000 a year.

The decision, when it is finally ratified, will have interest in relation to international trade, for we may assume that the burden cannot by any means be confined to goods for home consumption. The system adopted will severely handicap German industry in foreign competition for a few years, but it will provide for a fairly early release, when it is no doubt hoped that German export business will leap ahead.

Britain, for instance, will have a dragging financial burden to impede its trade movements, however the weight be distributed and irrespectively of whether one means or another is taken to discharge it. The British have a better ...than the Germans if ... the weight by imposing taxes upon raw products, if that course should seem best, and it is manifest that German action in that regard ought to influence their decision.

Nobody likes taxes upon the raw products of his industry, but the choice lies between evils, and a great deal is to be said for any system that promises to be severe but short as against systems nearly as onerous which are interminably long. The enemy's action lends a decided impetus to proposals for putting the cost of the war upon the price of raw materials.—M. L.

IN a paper read before the Society of Automobile Engineers by E. H. Sherbondy some interesting facts relating to the design of aeroplane engines were brought forth. The number of cubic feet of mixture which they will handle per minute is recognized as being one of the most important features of design. The mean effective pressure arrived at in the Sunbeam engines is within 15 per cent. of the theoretical maximum that is possible, while there may be some improvement secured in the future in the matter of horse-power weight efficiency by further refinement in the mechanical construction. The author believes that it is now necessary to make some change in the cycle of operation. This should be a splendid opportunity to try out supercompression and super-charging schemes of one sort or another. Possibly the two-stroke cycle engine, with its maze of new problems, stands as an opportunity, says the author.

THE Bessemer process for the making of steel was the starting point of the steel industry of the United States, according to Mr. J. G. Butler in an address before the American Iron and Steel Institute. The idea of removing carbon and silicon from blast-furnace iron in this way was undoubtedly first conceived by an American, although he failed to develop the machinery for its use, and, as a consequence, reaped very little benefit from it. When William Kelly, who first decarbonized iron by means of an air blast in a furnace he had erected for that purpose at Eddyville, Kentucky, about 1850, came to file his claim for a patent in 1856 he found that Henry Bessemer had filed similar claims, and had been granted patents a few days previously. Kelly had worked for years on his scheme, which was identical in principle, but he had not yet made it a commercial success, and did not attempt to make steel in that manner. Nevertheless, his use of the pneumatic process first was not disputed, and he was granted an interference as against the Bessemer patent.

ALLOYS of from 57 to 63 parts of copper and the balance of zinc are used in the extruding process for making rods, tubes and shapes and a mixture of approximately 50 parts of copper and 50 parts of zinc has the highest content of zinc the alloy may contain and be workable.

## WHY NOT INDUSTRIAL CONSCRIPTION, TOO?

IF it is right and proper that an administrative order-in-council should be passed "to prevent persons capable of useful work from remaining in idleness at a time when the country most urgently requires the services of all human energy possible," then it should not be a difficult matter to develop the principle involved to a point where not only idle energy but energy already engaged in more or less selfish pursuits will also be harnessed to the war team of the country.

The embargo which is at present under consideration might very well turn out to be a bird of a different feather and in addition to being a remedy for disturbed financial equilibrium, it may easily become a means of directing much industrial effort toward winning the war instead of piling up private profits.

If there is really need of "all human energy possible" the country should be willing to forego much in the way of private and public habits involving ostentatious display or the gratification of personal pleasures.

The cry will no doubt go up from some quarters that preparedness for future conditions necessitates the continuance and development, if possible, of numerous lines of manufacture which are not essentially war winners.

In this respect some neutrals have suffered much and gained nothing. With their food supply controlled and regulated in proportion to their least possible requirements, with embargoes on much of their distinctive national products, markets gone, raw materials vanished and tonnage pre-empted, these world waifs have felt, to a degree unthought of here, the buffetings of fortune.

How, therefore, can there be any valid reason for not controlling industry in addition to individuals?

There are many firms who, all things considered, are better off now than they expected they would be, whose products are not essential to the winning of the war, but who by reason of war-time prosperity are reaping large profits. Much of their profit is from trade due to the disbursement of war funds, and a considerable proportion of these same profits is finding escape from war taxation by expenditure on plant.

The individuals aimed at by the order-in-council are, most of them, doubtless subsisting on resources which existed before the war. They have to pay their income tax and cannot evade it by changing their profits into plant. They are not making profits from other people's labors and if their personal expenditure is at a minimum it is probable that government loans already have a large proportion of their surplus.

If the man who fails to work voluntarily is to be called to work under compulsion, why should not the firm which thrives on war-time extravagance also have its efforts directed to more necessary work?

## A DESIRABLE DEVELOPMENT FOR CANADIAN INDUSTRY

THE extent to which Great Britain's industrial awakening may develop is indicated by the announcement that Manchester School of Technology is to have a lecturer in Industrial Management. It is stated that through the beneficence of several large public-spirited firms in the district sufficient funds have become available to maintain the position for a period of five years.

The salary mentioned for the position, viz., $3,000 a year, should be ample to secure, in England at least, a party of suitable experience who is to organize a department of industrial management, conduct research work, lecture and assist business houses in the solution of management problems.

A significant feature of the development is the intention to offer sufficient remuneration to managers, directors and scientific experts to induce them to lecture on their experiences so that the department will maintain a healthy contact with actual practice.

The reputation of Manchester as a centre of export activity will cause the development to receive close attention in all parts of the world. Much of the efficiency effort and management discussion available at present to the anxious student is the product of personal specialization in restricted lines. The views, opinions, advice and ideas of men who have kept Britain's trade in its present unique state will be awaited with more than ordinary interest.

## COUNTERING THE ALIEN MENACE

AT the invitation of the Secretary of the Interior a national conference has been held at Washington for the purpose of considering the national plan of Americanization projected by the Department of the Interior.

The activity of the department is aimed directly at the anti-American propaganda among aliens which is mostly conducted in industrial plants.

Those present at the conference included the governors of the States, the chairmen of the State defense councils and about three hundred presidents of corporations and chambers of commerce along with other industrial leaders.

"English, the language of the United States," is the encouraging slogan adopted by the authorities and an appropriation is asked on behalf of the United States Bureau of Education for the purpose of rendering financial aid and other assistance to the States joining in a concerted plan to Americanize the many millions of foreign birth who are engaged in the industrial and commercial activities of that country.

The presence of prominent industrial men at the conference should give the event special importance in the eyes of our Canadian manufacturers. The manner in which alien labor has been allowed to fatten on war contracts is already notorious and the subtle influence of Teutonism may well have future trouble in store for Canadian firms if counteractant steps are delayed beyond the present favorable moment.

Alien exclusion after the war may become a fact, but that will not alter the point of view of present aliens who have prospered as never before and whose presence here in the future may not be desirable, let alone conducive to stable labor conditions.

ONE of the biggest difficulties connected with the quantity production of ships is the question of rivet driving. An idea of the task may be obtained when it is said that if a concern were to build one ship a week, a weekly number of 650,000 rivets must be driven. When we consider that the best rivet drive is by a company which drives 250,000 per week, and the next best is by the three largest shipyards on the Atlantic coast, the magnitude of the task involved in driving 650,000 rivets in one week may well be imagined.

# MAN'S OWN EXPERIENCE IS WORTH A LOT TO HIM

**H. L. Treat is Production Superintendent for T. McAvity & Sons, Ltd., of St. John, N.B.—His ideas are worth considering.**

THE shipbuilding industry is pulling men east and west. It is also pulling them from the south. That's how it happened that Harry Lee Treat is connected with the T. McAvity & Sons, Ltd., of St. John, N.B. He has made a success of the munitions business, and was early in it at a time when a great deal that is now accepted fact was in the experimental stage.

Mr. Treat graduated from the Middletown High School, in which town he was born. He started as an apprentice with Messrs. Pratt & Whitney Co., of Hartford, Conn. Soon after he completed his training he developed a special aptitude for tool and experimental work, holding a series of positions with the Royal Typewriter, Noiseless Typewriter, and Bryant Electric Co. He also spent some time designing tools and fixtures with the Singer Mfg. Co.

HARRY LEE TREAT

### In the Munitions Business

Mr. Treat was called on by the Ansonia Mfg. Co. when they started the manufacture of munitions. There was little or no precedent to go by in those early days, neither had the technical papers started in with their splendid work of explaining the making of shells and fuses. It was a case where individual initiative alone could solve the problem. To this work of laying out and designing special machinery and tools, Mr. Treat devoted his best energy and training, and he succeeded.

It was about two years ago, early in 1916, that Mr. Treat came to Canada, joining the McAvity Co. staff as production superintendent, which position he still holds. He has always taken a keen interest in sports, holding city championships several times as a bowler. Baseball owns him as an ardent supporter, and basketball is also a favorite. Much of his interest in sport has been in connection with the Y.M.C.A. in the various centres in which he has lived.

The McAvity people have consistently developed along sane and legitimate lines. They followed the increased demand with increased facilities for turning out the work.

Mr. Treat has very pronounced views of his own regarding the chances of the mechanic for advancement to the better positions in the industrial world. "A young man," said the St. John man, "has simply got to gather his own experience. That sort of training is, after all, the most valuable. He must, as he goes along, sift out the worthless—for after all, one is bound to meet with considerable of that. After a man gets his start and experience he can decide what line is his channel. Let him take the work that interests him, and then go ahead and stick to it. Jumping around from one line to another seldom gets a man anywhere. A man is never educated," continued Mr. Treat, "in fact life is a perpetual education to the man who will keep his mind open, and never allow himself to get to the point where he thinks he can learn no more. Keep in touch with the technical and trade papers. There are excellent opportunities presented in them. If mechanics would use the staffs of the technical papers more they would find many problems easy of solution. It is a good thing for a mechanic to get a problem of his own under discussion in these papers. In that way he can bring to bear on it the experience and opinions of other mechanics who may have encountered and mastered the same point. In brief," concluded Mr. Treat, "the man who succeeds can never quit picking up new points. They are coming out all the time, and there are lots of good ones in the list."

# INSURANCE COMMITTEE WILL DISCUSS THE RATES

**C.M.A. Insurance Department Will Consider Best Methods Of Dealing With Situation Caused By Increased Rates**

The insurance committee of the Canadian Manufacturers' Association will be called together soon, probably this week, to see what attitude they will take toward the increase in insurance rates which have been announced. They apply most directly toward the munitions plants, especially those that are working overtime on their orders, and the longer the period of overtime the higher the proposed increase in the rates will be. John A. Robertson, secretary of the Canadian Fire Underwriters' Association, claims that war conditions, increased cost of labor and conditions, the consequent spread of losses and the decrease of reasonable profit on the business have all worked toward making the higher rates necessary. Dwelling places, risks protected by automatic sprinkler devices and a few other special classes will not be affected by the increases. Factories working through the full 24 hours will be most severely fined by the new schedules as an additional charge of 50 per cent. of the basis rate will be imposed in all such cases. Shell factories will suffer the most severe increase, according to Mr. Robertson, as the basis rate has been increased from 2 per cent. to 2.25 per cent., with 1.12 per cent. added if they are operated all night, making a total premium of 3.37 per cent.

A representative of the insurance department of the Canadian Manufacturers' Association in speaking of the matter to CANADIAN MACHINERY stated that it was certain there would be little change in the rates announced. Much of the business done now is restricted to the operations of Canadian and English companies. This came into effect some time before the United States entered the war, the idea probably being at that time to prevent information leaking out about what was going on in the munition plants of Canada. The insurance men have picked out the class of risks that have not been paying their way, and the added assessment goes to them. There is apparently no chance of trying to raise sprinkler or fireproof risks, as according to the C.M.A. official, the independent companies would be too keen to come in and bid for this preferred class of business. Of course, he concluded, the insurance men are in the position of being able to sell insurance or let it slide. You can't force them to take a risk at anything but their own figures.

CANADIAN MACHINERY discussed the matter with several large munition men in Toronto but in very few cases will the rates be operative, as the plants are well protected by sprinklers, hydrants and other appliances. They have worked in close touch with the underwriters and consider that there is a very low risk in their plants, considering that the danger from the malice of foreigners has been reduced to the minimum. Despite any ruling, there is considerable United States mutual insurance on many of these plants.

# Dealers Announce Ten Per Cent Drop In Prices of Steel Plate--U.S. Speeds Programme

Pittsburgh Reports Improvement in the Production of Coke and Ore—U.S. to Turn Out Tankers to Store Oil to Fleet—Some Fluctuations Noticed in the Price of Non-Ferrous Metals.

The [illegible] have been looked for in prices of steel plates. Canadian buyers have taken definite [illegible]. Plates ¼ to ½ inch, are now listed at $5 per hundred pounds, a drop from the $10 mark. Heads and tank plates have also followed this lead and are selling at a range of [illegible]. Slight fluctuations are also noted in some of the non-ferrous lines, and as a result slightly lower prices are given. Supplies are not arriving in any faster order. This refers especially to the tin situation. Although certain prices are quoted for tin they are not adhered to, for the reason that the seller of tin is almost in a position to name his own price and pick the sale he desires.

United States mills are covered with orders apart from the government work, which has precedence over everything else. An estimate places this volume of business at twelve million tons. Just what amount of it is still to be regarded as real business is problematical, as much of it has been on the books at the rolling mills for months. Indications are for an improvement in the supply of the basic metals as outputs by actual performance of iron ore and coke are showing a steady improvement.

United States is preparing to turn to the concrete oil tanker to solve the problem of dealing with the carrying of oil for supplying its merchant and war fleet, and work is under way on the construction of a number of these poured-to-order boats.

Business is brisk in the machine tool trade. There are some Ontario inquiries about equipment for plants that will handle the larger shells, the 9.2. Dealers in machine tools are not keen to take on any more stock just now as their sheds are well filled. Unless they see a ready sale they are not quick to buy. Business remains good in supplies, there having been an exceptionally heavy run on high speed goods.

## CONDITIONS NOT FAVORABLE FOR SPEEDY COMPLETION OF STEEL MILL

Special to CANADIAN MACHINERY

MONTREAL, Que., April 8, 1918.—Industrial conditions have become more settled following the announcement that the steel situation will remain practically unchanged during the ensuing three months and possibly longer. The near approach of spring and the opening of navigation promises to relieve the transportation problem, but the requisition of many lake boats for ocean service will undoubtedly disorganize the inland tonnage to some extent. Montreal harbor officials intimate that the port will likely be open on or about the 27th of the present month, as prospects look good for the clearing of the river by that time. Some difficulty is expected in obtaining ample tonnage for maximum requirements. Future fuel supply has been under consideration by the Government, and on recommendation of the Advisory Council for Scientific and Industrial Research the Federal Government, in conjunction with the Provincial Government, has decided to erect a plant in the Province of Saskatchewan for the production of high grade domestic fuel from the lignite in that locality. Steps are also being taken to develop the peat bogs of Ontario for use as merchantable fuel. Steel conditions have become more stable following the reaffirming of fixed prices. Metals are unchanged, with tin developing an acute tone. Demand for machinery is comparatively light, but general business is steady.

### Steel

Despite the fact that some sections of the trade were looking forward to lower levels in the prices of steel products, the situation at the present time would appear to indicate that existing conditions will prevail for at least three months, if not longer. The relative stability of the market, particularly in the States, was manifest recently in the attitude of the American Government in renewing the prices that have governed the transactions during the winter months. With few exceptions these quotations have been recognized as a fair basis for present operations. The changes that were effected were made more to balance up the general situation than to alter the tendency in any particular commodity. While lower prices are not unlikely on the Canadian market, it must be remembered that conditions here are governed very largely by those prevailing in the States, especially in those lines that are not extensively manufactured in Canada. The greater volume of present business is for steel for munitions; Allied Government demands for shell steel are exceedingly heavy and British inquiries for upwards of 300,000 tons of steel plates has recently been reported. Some curtailment of domestic business in rails and structural materials is anticipated to meet the export requirements for shell bars. The steel situation has become increasingly acute owing to the recent heavy contracts placed by the American Government for freight cars, involving 1,000,000 tons of plates and 25,000 tons of shapes, so that ordinary contracts are incidental to present developments. Standardization in car construction is a feature of present activities; this, while tending to maximum output, has the tendency to disturb the market in certain car specialties. War needs are the dominating factor, and Government requirements are approximately 75 per cent. of total mill production. Although the establishment of a Canadian plate mill has been definitely settled, it will have little bearing on the existing market, as it will be impossible to have this plant on an operating basis inside of eighteen months. Every facility will be supplied for the securing of the necessary structural material and equipment, but present market conditions are anything but favorable for the speedy production of such a large undertaking. Dealers report a little easier situation and state that shipments are coming more regularly owing to the freer movement on the railroads; freight congestion is less pronounced, but in some instances difficulty is still experienced in tracing material in transit. Quotations generally are very firm and no changes are reported.

### Metals

The market in general is featureless, and with the exception of tin no developments of special interest are reported. Shipments from source to destination are more regular, and plants are suffering from non-delivery of material. Copper maintains its steady tone, with interest centred in the possible attitude of the War Industries Board towards prices for the ensuing period. Tin is still the dominating factor in metals owing to the continued difficulty in getting shipments through from England. Spelter is firmer. Lead is dull and inclined to weaken. Antimony and aluminum are firm and unchanged.

**Copper.**—The copper situation is undisturbed by the general trend in other markets, and is less affected than any

other. The present fixed price appears to operate with entire satisfaction, although reports from certain quarters would indicate that a higher price should prevail. One point that apparently favors higher prices is the gradual increase in the cost of production since the establishing of the existing set price. It is anticipated that when readjustment is considered prior to June 1st that small refineries at least will be given additional inducement for greater output at reasonable profit. Dealers here report a fair business at the quotation of 29c and 30c per lb.

**Tin.**—Recent developments have not been conducive to the relieving of the tension that has been so pronounced in the tin situation during the past couple of months. The shortage of metal has become additionally acute owing to the cutting off of much of the metal through Dutch sources. The seizure of Dutch vessels by the American Government has been a factor closely allied to the tin situation, as Holland is reluctant to permit steamers to leave Batavia for the United States. The danger is not so much in the further seizure of the vessels as to the possibility that Germany may exercise particular care in sinking these boats. This action has, therefore, added to the difficulties of getting ample supply for early future operations, and the situation at the present time is none too encouraging. The market in the States is very strong, and the situation here is very firm and likewise uncertain. Last week's prices are, however, maintained, and selling is confined as far as possible to essential requirements. Dealers are asking 98c per lb.

**Spelter.**—A little better tone has developed in spelter, and those dealers who were so anxious to sell last week are less prominent on the market. The undertone is undoubtedly stronger, and it is not unlikely that a little strength may develop from the present activity. New York prices, while lower than those of a week ago, are firmer than during the past few days, and further strength is indicated by present interest. The market here is unchanged at the quotation of 10½c per lb.

**Lead.**—Slightly lower levels are reported on the New York market owing to the light demand for home consumption. Concessions offered by producers create little additional interest. Government consumption is very heavy and shipment to England has recently been excessive. The weaker New York market has had a similar effect locally, but prices so far are unchanged; dealers quoting 10c per lb. on a quiet but steady market.

**Antimony.**—The situation is firm and prices are unchanged at 17½c per lb.

**Aluminum.**—The market is steady and with a slight undertone of strength. Prices asked are firm at 55c per lb.

### Machine Tools and Supplies

Another quiet week has been experienced in the machine tool industry here in Canada, although the abnormal activity still continues in the States; so much so that dealers here requiring equipment from American centres are uncertain of obtaining delivery within specified period, owing to the possibility of the American Government prohibiting shipment of machinery that is urgently needed for home use. Canadian manufacturers are fairly active and orders for general equipment, thought light, are comparatively steady. Business in small tools and supplies is reported good and prices on all lines are firm and unchanged.

## POINTS IN WEEK'S MARKETING NOTES

**The tendency toward a lower price for steel plate in Canada has this week found evidence in the listed prices showing a drop of 10 per cent. Lower levels are also asked for spelter, lead, antimony and aluminum.**

—

**The transportation condition continues to show improvement, although there are many evidences still in existence of the serious blockade during the past few months.**

—

**United States steel mills have orders to roll over 12,000,000 tons apart from war business. It is hard to say how much of this remains as real business, as much of it has been on the books for some time.**

—

**Reports from industrial centres in U. S. and Canada show a better feeling than for some time. Several embryonic strikes have failed to take form.**

—

**Pittsburgh reports indicate a decided improvement in supplies of coke, pig iron and finished steel, the change in condition, it is claimed, being quite noticeable.**

—

**The output of U. S. tonnage for the month of March fell below the outlined programme to the extent of 31,000 tons. Builders are urged to speed their work, regardless of expense.**

—

**Experiments will be made with concrete tankers for oil carrying, to serve the U. S. merchant and fighting fleet. On completion, the concrete ships will haul the Mexican oil output.**

—

**More regulations, aimed at restricting the supply of steel and steel products to war industries, are expected. President Wilson has been considering this matter for some days.**

—

**The output of steel in U. S. increases, but it does not keep pace with the rapidly-increasing demand.**

### Scrap

Activity in scrap materials is less pronounced than last week, and the market is inclined to dullness. This development has arisen from the want of unity between the holders, the dealers and the consumers. With the dealers' commission removed they are operating under difficulties that do not tend to the betterment of existing conditions. Under the circumstances many consumers are covering their immediate requirements only in the expectation that the situation will become more stable in the near future. Dealers report an easier tone in machine composition, but last week's quotations are still in force. A little heavier demand for brass scrap has added strength to this particular line, but prices asked are unchanged.

## PRICES OF PLATE REACH LOWER LEVEL

**Jobbers Able to Strike New Average by Better Buying at the U. S. Mills**

TORONTO.—It has been intimated in these columns for two weeks past that there was a decided tendency toward an easier price on steel plates and kindred lines for the Canadian buyer. This has now become an accomplished fact. For several weeks past dealers have been willing to accept what they termed desirable business at about ten per cent. off the price that was accepted at list. They did not come to the point though where they would put the figures down on the list until to-day. Plates, ¼ to ½-inch, eased off from $10 to $9. About the same thing happened in several other lines. Heads went from $10.25 to $9.25, while tank plates, 3-16, are quoted at $9.10, as against the old price of $10.10, which has stood for some time.

Local dealers explain the situation this way: Some months ago the Canadian jobbers stocked up at prices much in advance of what prevails in U. S. at present. Orders were rolled for them while the U. S. was contemplating the setting of prices. When the announcement was made of the new scale of prices it was [illegible] with high price material. The present downward tendency is really a relaxation on the part of the jobbers, and cannot be accepted as indicative of a similar move on a wider scale or for more basic reasons. Stocks that are being brought into the Canadian yards at present have been secured at a lower level, and this is having the effect of allowing the jobbers to strike a lower average scale. They have realized for some time that it was necessary to work toward a lower level for the sake of the Canadian consumer. The only way that this end could have been arrived at more quickly would have been for the Government to take arbitrary action that would have had the effect of breaking the jobbers.

Boiler tubes are short, and it is expected that there will be very little improvement in the situation. The Government of course has first call on all the stock that is produced. It is expected that it will be well on into May before there

[illegible] in the outlook, and [illegible] will only be very gradual.

Slightly lower tendencies are noticed [illegible] non-ferrous metal markets. No [illegible] reason can be ascribed for this. Spelter, lead, antimony and aluminum are all breaking away from the level of [illegible] weeks, aluminum going from $52 to $50, antimony and spelter each a dollar off, and lead 50 cents.

### Iron and Steel

With the easing in prices for Canadian trade now an accomplished fact it is expected that business will move more rapidly. The plate market is an interesting one, and the new avenues that open for business are interesting. "Whether from the increase in the amount of war bonds or other securities of a similar kind being held in the country," stated one dealer to CANADIAN MACHINERY to-day, "there is a bigger demand than ever for safety deposit boxes. Of course this means that there is a corresponding demand for the steel plate to make them. This refers to several of the smaller sizes, and it looks as though the demand would go on increasing."

### Machine Tools and Supplies

Business is brisk, deliveries better and trade generally satisfactory. The fire in the shipbuilding plant in Toronto caused a big demand for certain lines in replacement. High speed drills were bought in large quantities. Certain lines of tool holders are scarce, and the demand for B. & S. oil pumps is so persistent that deliveries now range from three to four weeks off. Shell plants keep the supply houses busy. There has been a stronger demand than usual for nose threading hobs. As a result certain sizes in these are getting to be scarce. The larger sizes, those that would be used for the 9-inch shell, are nearer the bargain counter than any others at present. Rumors of 9.2 orders are current on the street to-day, and some of the machine tool houses reported that there had been Ontario inquiries concerning the placing of the necessary equipment for the manufacture of this line. Local dealers are pretty well stocked up with second-hand machinery, and unless there are prospects in sight for a quick sale they are not keen on taking in much of this class of equipment. There is plenty of second-hand machinery offering at present, one dealer saying that it had been a long time since such an amount and range had been placed at their disposal.

High speed cutters seem due for a rise, possibly the usual ten per cent. The advanced price has not been actually listed yet, but it has been charged on several orders that were delivered in Toronto to-day, and it seems likely that this indication will be confirmed on the quotations.

The warehouse business has bright spots and dull ones, too, at present. Trade in bars and small shapes is good. Deliveries for this class of work are also showing an improvement, but such a thing as rolling plates for warehouses is out of the question at the present time, with the result that this section of the business can be said to be almost at a standstill.

### Non-Ferrous Metals

TIN. Tin prices are uncertain, even though quoted. There is virtually no such thing as an asking price for tin, as the values named are either bid prices or a mere appraisal. "The man who has tin to sell does not need to pay much attention to any price that is quoted in the market reports." That view, the opinion of a leading Toronto dealer, seems to sum up the situation pretty well at the present, and it is not risking much of a guess to believe that the same thing will apply for some time to come. Prices are quoted, but they are not adhered to. It comes right down to a point of bargaining between the man who has the tin and the man who wants it, and between them there is always present the man from the Government who has the right to step in and take the article.

LEAD.—There are no features of outstanding importance in the lead market. Business moves a little more slowly, the demand being less keen. Toronto prices to-day showed a drop from $9.50 to $9.

ANTIMONY.—Local dealers quote a lower level to-day, placing the mark at $16, which is a dollar off the price that has stood for some weeks.

ALUMINUM AND SPELTER.—Both these metals have felt the downward trend, and the latter is quoted to-day at $10, while for aluminum $50 is asked, against a previous fifty-two mark.

Little credence is given to the report published some days ago that nickel prices had been fixed. The whole output is well in the hands of the Government, as the International Nickel Co. is working in close harmony with the Allies. There is no need for a fixed price.

TUNGSTEN.— Increasing output is promised. Near Falcon Lake, east of Winnipeg, deposits of tungsten are reported. Denver reports point to one big mine yielding more than 100 one-ton tram cars of crude per day. Other mines are opening and showing satisfactory results.

### Scrap Metals

No price changes are recorded in the scrap metal market this week. Business remains within the smaller scope brought about by reason of the embargo remaining in force. Dealers in Toronto declare that they see no chance of a change in the situation. It may be that the American situation is being reflected in the Canadian trade. In U. S. centres the complaint is that users of scrap are buying too close. They are using only what they have to and buying accordingly. The dealers, with their customers in this frame of mind, find it a hard matter to properly interpret the future possibilities of the market. Locally trade is normal with a fair volume of business moving.

## WHAT HAMILTON MEN THINK OF THE PROPOSAL ABOUT AN EMBARGO

The Hamilton *Herald* interviewed a number of manufacturers regarding the probable effect of the proposed embargo on products coming from United States to Canada. The *Herald* says:

J. J. Greene, managing director of the Sanford Manufacturing Company, says that he thinks the law, although it would be hard on some dealers, would eventually serve as an incentive for increased production, and as a war-time measure be beneficial.

The manager of the McLaughlin Carriage Company is also in favor of the proposal. He states that it would be the best thing for the automobile business on the whole, and that it would certainly stimulate trade in Canada and help home production by keeping Canadian money in Canada.

John Lennox, of the Lennox Company said: "I am in favor of an embargo upon American goods. I am sure that, with the incentive such an embargo would create, the Canadian manufacturers would be able to produce goods quite as efficiently as the Americans do."

C. H. Martin is bitterly opposed to the embargo. He declared that it would put many automobile dealers out of business, as Canadian manufacturers could never, at such short notice, hope to produce as much or manufacture cars as efficiently as the Americans.

## SPEED BUILDING IN SPITE OF THE COST

### Orders for This Have Been Issued to Contractors in United States on Government Work

Special to CANADIAN MACHINERY

WASHINGTON, April 8.—Drastic regulation of the steel supply of the United States is in sight. Reports coming from shipyards of a serious steel shortage have aroused officials to action and it appears now that some strict orders will be issued by the President regarding the sale of steel and the output. The first regulation will undoubtedly be aimed at the non-war industries.

There is at present an argument going on among steel manufacturers as to the advisability of any such action. Some steel men maintain that there is a sufficient supply of steel in the United States whereas others take the stand that the country is confronted with a serious shortage.

### Shortage is a Fact

J. Leonard Replogle, director of steel supplies of the War Industries Board, and one of the leading steel men of the United States, maintains that there is a steel shortage. He declares that the output of steel in the United States is the greatest in history at the present time but that the demands have grown faster than the output. He urges that the closest co-ordination be adopted in the use of steel by all in order that there

may be no hindrance of the war program of the United States because of a lack of steel.

### Blame the Rails

Other manufacturers are inclined to place the blame for the apparent shortage of steel upon the transportation situation. It has been shown that in the instance of the Hog Island yard there exists a shortage of some twenty thousand tons of steel plates. At the same time the records show that 60 per cent. of the total tonnage of steel ordered for the Hog Island plant has been turned out by the mills. But about three per cent. has been delivered. The remainder is caught in traffic congestion somewhere between the mills, the fabricating plants and the shipyard. To remedy this an absolute priority on all steel for shipyards will probably be issued. This will give a priority to steel over everything else except supplies urgently needed for the army and navy.

### Speeding Up the Work

During the past week the United States Shipping Board has taken steps to speed up the shipping program. Builders have been urged to take all steps, regardless of expense, in order that time may be saved. Chairman Hurley after a most optimistic statement last week, issued a statement this week showing that the output of vessels during March fell below schedule. During March, according to Mr. Hurley, but twenty-one steel vessels were completed. This gave a tonnage of 166,700 tons and the minimum tonnage for March on the program of the Shipping Board was 197,075 in steel vessels. Eleven wooden ships with a tonnage of approximately 40,000 tons were launched.

### Building Tankers

The problem of tankers is giving the Shipping Board some trouble now. Chairman Hurley declares that the steel program is coming along in such shape that it faces the problem now of a number of steel vessels without sufficient tank vessels to keep these ships supplied with oil. To relieve this situation as far as possible the Shipping Board is to attempt the experiment of concrete tankers. Contracts are being prepared for seven concrete tankers, four of a large tonnage and three of a small tonnage. These vessels will be under construction within sixty days and it is expected that it will take approximately sixty days for their completion. They will be placed in the Mexican oil trade.

### Has Wide Powers

Wide extension of the powers of the Federal Government over shipping, shipping rates, and shipbuilding are being asked. Legislation has been offered to Congress, which gives the President the power, through the Shipping Board, to charter and take over ships, docks, wharves and terminal facilities. Another bill would widen the powers of the Shipping Board to grant it authority over the ownerships and transfer of vessels, existing or under construction.

In order to man the merchant marine fleet which is now in building the United States Shipping Board has secured the use of several vessels to be used as training ships for boys between the ages of 17 and 27 as seamen.

### Some Big Orders

The United States Navy is about to ask for bids on a large amount of hand tools and hardware. Specifications may be secured from the Bureau of Supplies, United States Navy Department, Washington, D.C., by calling for schedules 1755, 1758, 1759, 1760 and 1761.

According to reports of the United States Shipping Board 182 vessels have been launched in the United States since the creation of the Shipping Board. To a large extent this represents vessels which have been requisitioned.

Reports show the production of bituminous coal has been increased. The week of March 31 shows that the total production is estimated at 10,972,000. This shows an increase over the last weekly report, which showed a decrease.

There is a serious shortage of chromite in the United States. Officials have decided that this Government will have to call upon the Canadian Government for relief. The chromite secured from Canada last year approximated 20,000 tons. It is estimated that nearly double this amount will be needed during the year 1918.

Labor conditions in the United States are in better condition at present than they have been for some months past. Embryo strikes in shipyards have been stalled and there is a better feeling existing between labor and capital than there has been since the war began.

## MACHINE TOOLS ON UPWARD TENDENCY

### Great Demand is Having Effect of Making the Price go Even Higher

Special to CANADIAN MACHINERY

NEW YORK, April 6th.—The U. S. Shipping Board is making a strong effort to expedite the building of merchant boats at various yards. The delay in the shipbuilding program has been almost entirely due to the breakdown in transportation service during January and February, but with a better movement of steel and other raw material by the railroads, and the assembling of fuel and other needed supplies at the plants of the steel companies, more active operations at shipbuilding plants are insured in the next two months. The steel companies are now producing plates and shapes designed for shipbuilding purposes as never before. Some important launchings of merchant boats for the Government will be made the latter part of this month and early in May.

### The Emergency Fleet

Another contract for 60 8,300-ton cargo boats has been placed by the Emergency Fleet Corporation with the American International Shipbuilding Corporation, which is building and operating the Government owned plant at Hog Island. These boats will require about 168,000 tons of steel plates and shapes, but the boats will not be con-

## ALREADY DISCUSSING HOW TO MEET GERMAN AFTER-WAR COMPETITION

A London, Eng., correspondent, discussing the future marketing conditions in the competition for after-war trade, says:

"On the other hand, Germany's organizing genius is such—the co-operation between manufacturers, merchants, bankers and the Government is so complete and thorough—that unless there is something like corresponding unity of action among our people and between our trades and the State, we may find ourselves beaten even more seriously by the Germans after the war than we were before. Although hampered by certain great disadvantages, including a late start in the race, less favorable assemblage, manufacturing and shipping facilities, a much smaller colonial Empire needing iron and steel, smaller capital investments abroad in steel-consuming countries, and a less economic dependence on manufactured exports to balance food imports, Germany was actually exporting iron and steel goods at the rate of nearly 7,000,000 tons a year on the eve of the war, against our 5,000,000 tons. Organization was the chief factor in German success. Lack of organization was the chief cause of our failure.

"The German trade syndicates intend to renew, in an intensified form, if possible, their bounty-fed 'dumping' policy, and the German Government has promised to subsidize shipping, which means a more liberal exportation of German goods in the future than in the past. Obviously, organization is one of the essentials of success, alike in our defensive and offensive trade compaigns. The only debatable point is that of the principle, or method, of our organization. Much of the evidence given before the Iron and Steel Trades Committee dealt, naturally enough, with the methods of the German steel cartels, or syndicates, for it is chiefly to meet the highly-organized competition of these German unions that combination is so imperatively needed on our side. German competition is not only highly organized by associations of manufacturers, but it is bounty-fed by the syndicates and subsidized by the Government. It is too much to expect individual British firms, unorganized among themselves and unsupported by Government, always to compete successfully against the State-supported syndicates of Germany."

[illegible] contracts for 180 [illegible]

Another contract for 12 all-steel freight boats has been awarded to the Carolina Shipbuilding Corporation by the [illegible] Fuel Corporation. The Carolina [illegible] recently incorporated under the laws of Delaware and will build yards at Charleston, South Carolina. Lorenzo Dilkes, formerly president of Miliken Bros., Inc., is president, and Eads Johnson, naval architect, of New York, is also interested in the new company. Cranes, tools and other [illegible] to be purchased in the near future.

### Needing Equipment

Several other shipbuilding companies on the Atlantic coast, including the Federal Shipbuilding in the Hackensack Meadows and the Tank Shipbuilding Corp., a subsidiary of the Southern Oil and Transport Corporation, which is extending its shipyard at Newburgh, N.Y., are buying machine shop equipment and other machinery, including steam hammers and cranes.

Several small machine tool shops in the vicinity of New York that have received orders from the Ordnance Bureau of the War Department for gauges and other munition parts, have been buying machine tools in this market. The Harroun Motors Corporation, Wayne, Mich,. has also been buying shop equipment for fulfilling a large Government contract for projectiles.

### Prices on High Level

The higher wages paid labor, both skilled and unskilled, and the higher prices paid for material are held responsible for additional advances in prices of machine tools that became effective April 1st. Manufacturers of precision lathes have advanced selling prices 10 per cent. and one maker of hand screy machines has announced an advance of 15 per cent. to be effective April 15th.

Another small list of tools put out by the Watervliet arsenal has reached the New York trade in the last week. Other Government orders for tools are pending.

Railroads, generally, are quiet, but the Chicago, Burlington & Quincy is asking for prices on 100 machine tools from manufacturers in the Chicago district. Eastern roads are more interested in structural work, the Lackawanna having put out an inquiry for a coal breaker requiring 2,000 tons of structural shapes. The Chesapeake & Ohio and the Southern Railway are asking for prices on several thousand tons of bridge work.

The Standard Oil Co. and the American Tobacco Co. have each issued lists of tools for repair shops. The oil company asks for prices on drill presses, drilling machines and one planer, one shaper, and one lathe and for one milling machine.

Orders for about 60,000 tons of special barbed wire for export to Italy have been distributed among the wire mills. The U. S. Government has also placed additional orders for wire nails for domestic shipment.

## LOOKING FOR MUCH GREATED PRODUCTION

### Shipments of Coke, Pig Iron and Finished Steel Are Showing Improvement

Special to CANADIAN MACHINERY

PITTSBURG, Pa., April 8.—All the news has suddenly become very favorable as to there being in the near future ample supplies of coke, pig iron and finished steel. The reversal in conditions, that has appeared from theoretical considerations to be likely at some time in the future, is now becoming possible of actual apprehension by the development of concrete facts. These facts are, in brief, heavier shipments of Connellsville coke actually recorded, the nearing completion of many new by-product coke ovens, a large increase in pig iron production actually recorded in March, the completion of three new blast furnaces and the blowing in of several blast furnaces that were kept out of blast during the period of extreme coke shortage.

As to Connellsville coke shipments, which are reported weekly by the *Connellsville Courier*, there were shipments reported for last week of no less than 383,708 net tons, against about 334,000 tons a week in the three weeks preceding, and an average of only 250,000 tons a week in the first five weeks of the year.

As to pig iron production, there was a reflection in the March output not only of the increased supplies from the Connellsville region, but also of better working of beehive ovens in other districts and of practically full operation of the various by-product ovens. Pig iron output during March was at the average rate of 38,250,000 tons a year, while during the latter part of January and the early part of February output was at but little if any over 25,000,000 tons a year.

### Railroads Improving

The heavier operations of the past few weeks are a reflection of the better conditions that are gradually coming to obtain on the railroads. While the progress appears to be slow, when there is still congestion and car shortage after two full months of favorable weather, fresh evidence has appeared as to the seriousness of the situation early in the year. A partial report of railroad operations in January, just issued by the Interstate Commerce Commission, shows that the railroads actually had a deficit in January, following their very large earnings in preceding months. It is assured that traffic conditions, as relate to the iron and steel industry, will continue to improve. After the extremely bad weather disappeared, the first week in February, there was for several weeks a particularly heavy movement of foodstuffs to seaboard, at the instance of Washington, and this retarded the improvement in the movement of other commodities.

A general survey of the situation shows that there is capacity for making much more pig iron than was produced, and consumed, in 1916, when the output was 39,400,000 tons, the 1917 output having been 800,000 tons less because while some new furnaces had been completed there was not enough coke to operate all furnaces. Four new blast furnaces were completed in 1916 and 14 in 1917, while last month three additional new stacks were blown in, making a total of 21. On the basis of the actual performance in 1916, the capacity at present, with the additions, is easily 43,000,000 tons.

As to coke making capacity, it is clear that there is an excess over the entire requirements of the existing blast furnaces, and this is in keeping with the fact that the beehive process is rapidly yielding to the by-product process. If there had been full transportation facilities the large excess of coking capacity would have been visible during the past year. The by-product ovens completed in 1917 represented 3,500,000 tons of coking capacity, while by-product ovens now nearing completion, and likely to be put in operation in the next few months, represent 6,500,000 tons in addition, making a total of 10,000,000 tons new capacity over the capacity that was active in 1916, and supplied fully the blast furnaces then in existence. The furnaces since completed, however, would require not more than about 5,000,000 tons of coke a year.

The most important of the by-product plants nearing completion is that at Clairton, near Pittsburgh, 640 ovens. It will probably be making some coke before July 1, and should be producing its full output, some 2,700,000 tons a year, within a short time thereafter. It will receive its coal entirely by water, and will deliver coke to the attendant blast furnaces (of the Carnegie Steel Company) over the interplant railroad, so that the whole operation will be entirely independent of the railroads. It would have meant tens of millions of dollars additional earnings for the Carnegie Steel Company if this plant had been completed on schedule time, six months ago.

### Dull Market

The markets are extremely dull, in pig iron and practically all finished products. This is a reflection of the fact that there are no new projects coming up except in connection with the war, and the trade does not consider allotments for the war as part of the market. The requirements of jobbers and manufacturing consumers, in connection with commercial or peace work, are fully covered, in many cases more than covered, by engagements already on books. The steel mills have more than 12,000,000 tons of obligations on books, entirely apart from the war. How much of this is to be real business remains to be seen. At the rate at which shipments have been made in the past two or three weeks it will not be long until customers assure mills they are well supplied, ending the steel scarcity that has now prevailed for two years and a half.

### Ship and Car Requirements

Actual facts as to shipbuilding, not shipbuilding plans or prospects, are now beginning to come out. It appears that a monthly statement of ship deliveries

(Continued on page 71.)

# SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

## ENGINEERING

Yorkton, Sask.—Yorkton Board of Trade is a result of advice from John T. Reid, M.P. for Mackenzie, that the Minister of Railways has definitely promised that steel will be laid on the Hudson Bay Railway this season, connecting The Pas with tidewater at Port Nelson. Steel will also be laid for distances of approximately 25 miles westward from Preeceville, on the Thunder Hill branch of the C. N. R.

Peace River, Alta.—The last yard of concrete was placed in the last pier to be constructed for the Central Canada railway bridge over the Peace River on March 27, the steam whistle of the hoisting plant joyously blowing the signal at 3.55 o'clock. Men and boys, officials and employees, to the humblest laborer on the plant threw their caps high in air and cheered this, the epoch-making moment in the history of Peace River country development. When completed, the Peace River railway bridge will be one of the largest in Western Canada, being 1,735 feet long from abutment to abutment, and 77 feet above low-water level. The three central piers in mid-channel were built in 40 feet of rapidly-running water, this depth being low-water mark.

## MUNICIPAL

**Needs New Car.**—Hamilton Board of Control consider purchasing new car for the fire chief and one for the health department.

**Kingston Civic Plants.**—The Public Utilities Commission at the present time are installing a 5,000,000 gallon De Laval motor-driven pump at the local water works pump house. This will give the commission two independent sources of supply—5,000,000 gallons electrically, and 7,000,000 gallons in the steam pumps, there being one Inglis engine of 4,000,000 gallon capacity and one Killey engine of 3,000,000 gallons. The power for the new electric pump will be furnished by an independent three phase feeder line over a separate line of poles running from the main power house, which is used jointly with the Hydro-Electric Power Commission as their new sub-station. In addition to the alterations at the pump house the commission have purchased a 300 k.w. and one 150 k.w. motor generator set to operate the local street railway; these machines to replace the present 350 k.w. engine-driven generator now in operation. The main power house at the corner of King and Queen streets has been completely overhauled. Transformers capable of looking after 1,000 h.p. have already been installed and in addition to the above a supply of power is furnished by the Canadian Electric Light & Water Supply Company at Kingston Mills, over a 13,200 volt transmission line. The local commission are considering extensive alterations to the different plants during the present year, among them being the erection of a 300,000 cub. ft. gas holder recently purchased from the Davis & Farnum Manufacturing Co., Waltham, Mass

## PERSONAL

**John M. Taylor, Jr.,** assistant to J. M. Taylor, Sr., president of the Taylor-Forbes Co., Guelph, has returned to his office after a month's illness. Mr. Taylor underwent an operation of some seriousness at the Guelph General Hospital, from which he has now fully recovered.

**James M. Smith** has arrived at Fort William to take charge of the shipbuilding and of the plant of the Canadian Car and Foundry Company, which is under contract to turn out twelve trawlers for the French Government before the close of navigation. Most of the steel for their construction has been assembled at the works, and the building in which they will be built is almost completed.

**C. N. Schrag,** of the Bawden Machine Co., is leaving there the 1st of May, to go into partnership with O. W. Meissner, manufacturers' agent, Montreal, handling a line of railroad, pulp mill, marine and engineering supplies. Mr. Schrag will open a Toronto office in the Royal Bank Building.

**J. B. Brophy, C.E.,** who was chief engineer of Cape Breton section of the Intercolonial Railway from Grand Narrows to Sydney during the construction in 1889 and 1900, and who was resident engineer for the past two years of reconstruction of St. Peter's Canal, and lately engineer of railways and canals at Cornwall, died after a short illness of pneumonia at Ottawa. The late Mr Brophy was married at Sydney to Ella, eldest daughter of the late J. H. Hearn, K.C., who predeceased him four years ago. He leaves two daughters. The late Mr. Brophy never fully recovered from the loss of his son, Lieut. "Don" Brophy, of the Royal Flying Corps, who was killed while on duty on the east coast of England at Christmas in 1916. Col. Bob Low is a brother-in-law of the late Mr. Brophy.

**W. H. Winterrowd,** formerly assistant chief mechanical engineer of the Canadian Pacific Railway, has been appointed chief mechanical engineer in place of W. E. Woodhouse, who has asked to be relieved of that position. Mr. Winterrowd had a university training in addition to practical experience in the shops and in various branches of the mechnical departments of the Pennsylvania and New York Central railroads before he joined the Canadian Pacific Railway six years ago. He was brought to Montreal by H. H. Vaughan, now vice-president and general manager of the Dominion Bridge Co. It is an interesting coincidence that Mr. Vaughan was exactly the same age, namely, thirty-six, when he himself was appointed chief mechanical engineer of the Canadian Pacific Railway.

## TRADE GOSSIP

**Changing Location.**—The H. W. Johns-Manville Co., New York, announce that their Youngstown, Ohio, office will be located at number 20 Market Street after April 1.

**Airplane Spruce.**—The department of Indian Affairs has decided to allow the Indians to sell spruce timber for airplane purposes on the Tscheacton reserve. O. Bowman of Chilliwack has completed a shipment of two cars of spruce for this purpose.

**New Line of Torches.**—The Canadian Welding Works, Montreal, P.Q., are placing a new line of cutting and welding torches on the market. The torches are of special design and incorporate a number of special features that increase the efficiency of the appliance.

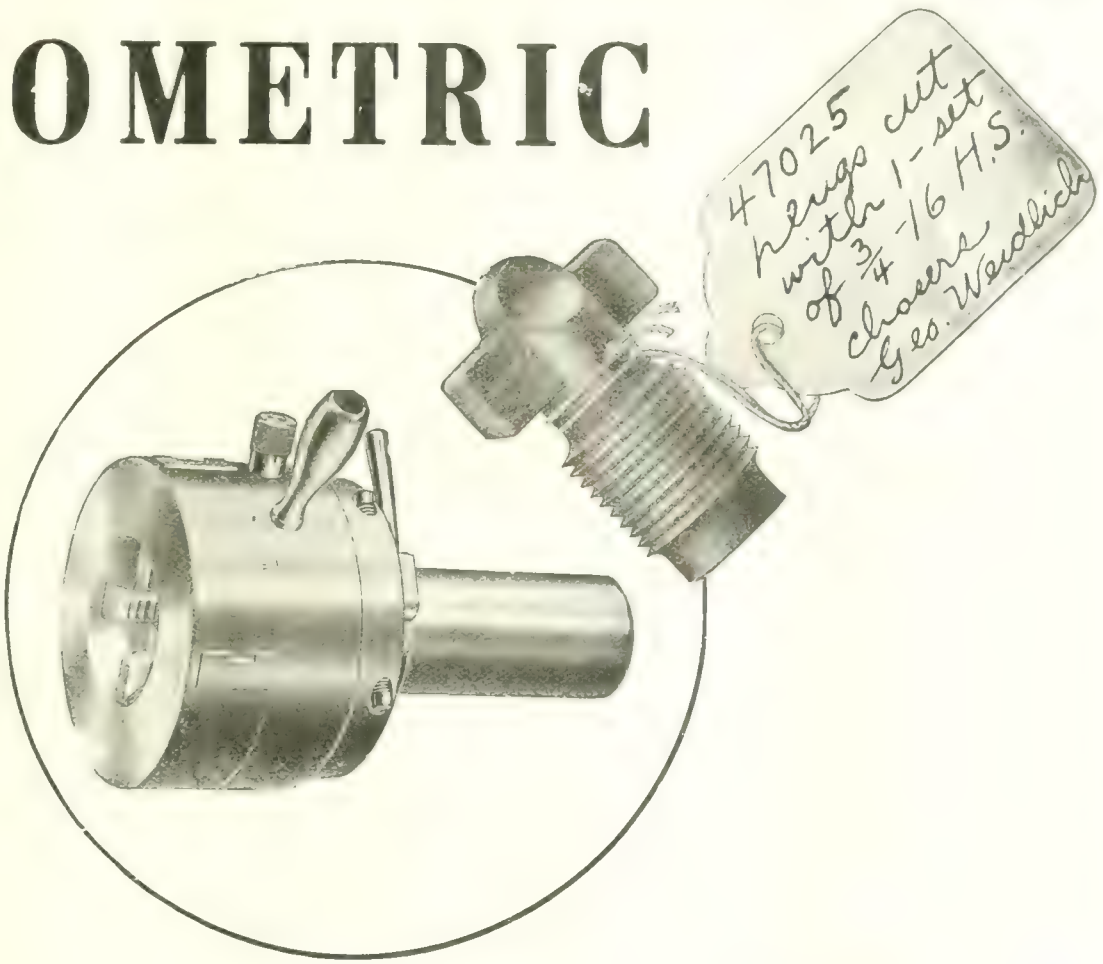
**Look For Fair Price.**—Equipment interests feel assured that the U. S. Government orders for freight cars, which are to be placed shortly, will include a good price. American Car & Foundry Company will get the biggest slice of the business. In all probability Standard Steel Car Company will come second on the list, Pressed Steel Car Company third, and Haskell & Barker fourth.

**To Make Steel.**—Canada Western Steel Co., Calgary, are putting in an open hearth plant at Redcliffe, Alta. This is a unit plant of 220 tons capacity and is being built so that other units may be added in order to make a battery. They will make all grades of open hearth steel. It is expected the plant will be ready for operation in July or August. George A. MacKenzie is the managing director.

**Accepts Lake Freight.**—The Canadian Manufacturers' Association has just been advised that the Canadian Pacific Railway expects to accept lake and rail freight for points Fort William, Port Arthur and west, on April 20, and that the first sailing will leave Port McNicoll on May 1, and to accept traffic on the same date at Owen Sound for intermediate lake ports.

**Ottawa Rumors.**—While the outlook for a continued flow of munitions orders to Canada this year is still somewhat indefinite, pending further negotiation with the British authorities and more explicit instructions to the Imperial

# GEOMETRIC



## One Set of Chasers in a Geometric Die Head has cut 47,025 of these Plugs

The man who has operated the Geometric Die Head says: "In all my twenty-five years' experience I have never known a die to cut as many threads as this set has cut on cast iron."

A quarter of a century of specializing in one line has brought Geometric Thread Cutting Tools up to the high water mark.

Arrange to do your threading with a Geometric. Let our catalogue tell you about it.

## THE GEOMETRIC TOOL COMPANY

NEW HAVEN, CONN., U.S.A.

*Canadian Agents:*

Williams & Wilson, Ltd., Montreal; The A.R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N.B.

Munitions Board as to estimated requirements, the board expects that the combination of British and American orders from now until the end of the year will represent a combined output of from twenty-five to thirty-five millions per month.

**Will Open Early.**—Because the ice is moving so satisfactorily, it is expected that navigation through the Welland Canal will be opened earlier than usual this year, and this is the desire of the government. Lock tenders all along the canal have been instructed to be ready to go on duty soon. The ice has left the canal and it is hoped that conditions at Port Colborne harbor will allow an early start. The usual opening is April 15.

**Electro Galvanising.**—T. Scott Anderson of Sheffield has issued an interesting little book on electro galvanising, cleaning and welding, dealing with each of these matters in an interesting manner. In referring to electro-cleaning of iron and steel he points out there is no loss of iron, no limit to the dimensions of the work, the structure of the metal is not injured and the process is harmless and economical.

**Laying Men Off.**—The Canadian Aeroplanes, Ltd., Toronto, laid off a considerable number of men—more than a third of their total staff—last week. On the other hand the Curtiss Aeroplanes, Ltd., have just moved from the premises they occupied in Pearl Street to the much more spacious and excellently-equipped factory of the Toronto Furniture Co., on Dufferin Street, near Exhibition Camp. There was a procession of men laid off at Canadian Aeroplanes visiting the employment offices at Curtiss Aeroplanes trying to get jobs. The Curtiss firm is taking on new help, but it could not handle all the applicants who came from Canadian Aeroplanes.

**Coal Prices Firm.**—While there has been a reduction in United States points on coal during the past few days, values in Canada for the most part remain the same as during the past winter. Toronto dealers are asking $9.75 and $10 for egg and nut. They claim that the freight and lake rates have been increased and that it is costing them more to take care of the business. Under the new regulations a person who burns over six tons of coal during a winter comes under the restrictions. Such a person can get seventy per cent. of the amount he requires. That means that a person who burned ten tons could purchase seven until such time as the order is rescinded by the provincial fuel controller.

**A Nine-Hour Day.**—The Frost & Wood Co. inaugurated a sweeping change this week in the regulations governing labor in their shops at Smiths Falls, Ont., when they instituted a nine-hour day in all departments except the munitions shop. The working hours will now be from seven in the morning to five in the afternoon and on Friday the whistle blew at five o'clock for the first time. The same scale of wages will be in effect for the nine-hour day that has prevailed on the ten-hour day, and piece work men and shell workers will receive a corresponding increase in pay. It is one of the most important changes in the regulations covering labor that has ever been put into effect voluntarily by any large Canadian industry.

**To Make Fuel.**—The Dominion Government has fallen in with the recommendation of the Advisory Council for Scientific and Industrial Research for the manufacture of a domestic fuel from Saskatchewan's supply of lignite. A sum of $400,000 has been provided for this purpose. In this undertaking the Dominion Government is acting in cooperation with the governments of the provinces of Saskatchewan and Manitoba. The council has received a request from the Ontario Government asking that that R. A. Ross, C.E., one of the members of the council, be appointed to act with Arthur Cole, C.E., as a committee to take immediate steps for the development of the peat bogs of Ontario, and the production from them of a merchantable fuel. The Research Council has concurred in these appointments and the investigation will be proceeded with.

**Garbage Fuel.**—"When the coal shortage was most acute and manufactured fuel was being advocated," says the Hamilton "Times," a good deal was said about the success of a garbage fuel plant in Colorado City, which was said to be a great success. To-day the "Times" received a letter from E. F. McGowan, of Denver, Col., president of the Minequa Coal Company, who writes as one of those who went into the garbage fuel project. Mr. McGowan says he has read in the "Times," the report of the proceedings in Hamilton, and the account of the success of the plant referred to. He adds: "We have spent over $51,000 on this plant. It is first class in every way, as near automatic as possible. We have shut down everything and have boarded up the windows. A little later we are going to sell the machinery for what we can get for it." He declares that the project is not a success and advises any city which contemplates going into it to go and see the plant or get in touch with him.

**Open Toronto Office.**—For the convenience of their customers in Toronto and vicinity and in Eastern Ontario, the Dominion Forge & Stamping Co., Limited, Walkerville, have opened an office in Toronto at 510 Lumsden Building. This office has been opened particularly with a view to looking after the interests of manufacturers of munitions and other war materials who are using forge component parts such as base plates, etc., made by the Dominion Forge & Stamping Co., Limited. Mr. J. C. Armer, who has recently been appointed sales manager for the company, will spend a good deal of his time at the Toronto office. Mr. Armer is known to manufacturers in Canada because of the position he held until about eighteen months ago as vice-president and manager of the *Canadian Manufacturer* and other technical papers. Since then he has been on active service in Canada as an officer in the Canadian Engineers, his retirement from the service being occasioned by the decision of a medical board at headquarters that he could not go overseas.

# TENDERS

**McMasterville, Vercheres Co.**—Tenders received up to April 13 for construction of concrete road and two bridges. J. N. Page is secretary-treasurer of the village.

**Ottawa.**—Sealed tenders will be received at this office until 4 p.m. on Monday, April 22, 1918, for the charter of tug Hercules. This is a steel tug, Official Registry No. 122,217, length 105 ft., beam 24 ft. 6 in., draft 10 ft. 6 in., triple expansion engine of 14¼ in., 22 in. and 36 in. by 21 in. stroke. The tug is in Midland Harbor, Ont., and can be inspected by appointment with the district engineer of the department at that place. Apply district engineers, Midland, Equity Building, Toronto, and office of assistant chief engineer, Birks Building, Ottawa.

**Toronto.**—Tenders will be received by registered post only, addressed to the Chairman, Board of Control, City Hall, Toronto, up to 12 o'clock noon, on Tuesday, April 16th, 1918, for the construction and delivery of: Tender No. 35—Air chambers and cast iron special castings. Tender No. 36—Feed water heaters for main and high level pumping stations. Specifications and forms of tender may be obtained at the Works Department, Room 12, City Hall. T. L. Church (Mayor), Chairman, Board of Control.

**Toronto.**—Tenders will be received, through registered post only, up to noon, Tuesday, April 16th, 1918, for the construction of the following work, viz.:—Asphalt pavement—Danforth Avenue, from 28 rt. 3 in. west of the w.s. Broadview Avenue (running south produced), to 511 ft. farther west. Tenders must be addressed to the Chairman, Board of Control, City Hall, Toronto. Specifications and forms of tender may be obtained at the Department of Works, City Hall. T. L. Church (Mayor), Chairman Board of Control.

Tenders for steam heating barn construction will be received until Thursday, April 11, in connection with the Horticultural Fruit Experimental Station at Jordan Harbor, Vineland Station, and for the construction of a barn, to be erected at the Ontario Agricultural School, Kemptville, Ontario. Plans and specifications can be seen for the steam heating plant at the office of the director of the station, Jordan Harbor, and at the department, and for the barn at the office of the Department of Agriculture, Kemptville, and at this department. Address, H. F. McNaughten, Secretary Public Works, Ontario.

Tenders are being called by J. W. Pugsley, secretary, Department of Railways and Canals, Ottawa, for the Halifax, ocean terminals as follows: Transit sheds Nos. 21 and 22, Pleasant Street subway, water and sewer systems and grading and

lowering of Fawson and Water Streets, car cleaning shop, stores and ice house, temporary station, baggage, mail, express and commissary building. Tenders close on the 13th. Plans can be seen at the following offices: Chief engineer, Department of Railways and Canals, Ottawa, Ont.; chief engineer, Canadian Government Railways, Moncton, N.B.; Halifax Ocean Terminals Office, Halifax, N.S., and Messrs. Ross and MacDonald's office, Montreal, Que.

**Ottawa.**—Sealed tenders will be received until noon, April 23, 1918, for electric conduit and fittings required in the reconstruction of the Parliament Buildings, Ottawa. All tenders to be based on the supplying and delivering on the site of the quantities of the schedule of material for electric conduit and fittings, in strict conformity with the specifications and the samples submitted and to the satisfaction of the architects. Deliveries to commence so far as possible immediately after the signing of the contract and to continue as directed in such quantities as to ensure complete delivery by June 1, 1918. The schedule of material, specification and any other information required can be obtained at the office of the P. Lyall and Sons Construction Company, Limited, Ottawa; John A. Pearson, architect; J. O. Marchand, associate, Centre Block, Parliament Hill, Ottawa.

## CONTRACTS

**Matheson, Ont.**—The town of Matheson is passing a by-law to provide for the borrowing of $40,000 for the purpose of building a system of waterworks and sewerage. The equipment needed comprises a concrete pump house, well, oil engine, plunger pump suction and discharge pipe, reservoir and water mains, etc. H. George Ginn is the clerk of Matheson.

## MARINE

**Washington.**—In order to discourage the shifting of shipyard labor from one yard to another, the Shipbuilding Labor Adjustment Board recently put into effect a standard wage scale for all yards on the Atlantic and Gulf coasts.

**Detroit.**—Each of the Great Lakes was at a higher level in March than the average for the month in the last ten years, according to the monthly report issued by the United States Lake Survey Office at Detroit. Lake Superior was the only lake falling to a lower level in March than in February.

**Sarnia.**—Steamboat managers in Port Huron and all along the lakes have received notice that no enemy aliens will be allowed to ship aboard any boats plying the lakes this season. If found on any ship they will be arrested and placed in imprisonment. The American Government is very strict as to who shall go aboard ships this year.

**Toronto.**—The navigation season has opened. The steamer Macassa, of the Canada Steamship Lines, left her Toronto port for Hamilton. Capt. Corson was in charge of the vessel, and, according to a time-honored custom, will be the recipient of a silk hat. Although the decision to send the Macassa across the lake was just made on short notice, there was an unusually heavy freight cargo.

**Port Burwell.**—The car ferry, Maitland No. 1, running between Ashtabula Harbor and Port Maitland, started on her first trip of the season on April 1, and is meeting with some heavy ice on the way. The S.S. Ashtabula, under Capt. Meyers, is expected to move on Wednesday. She runs between Ashtabula Harbor and Port Burwell. The fishing is well under way at this point, the catches being reported good.

**Halifax.**—The trial of the action and counter-claim in the Admiralty Court between the owners of the Mont Blanc and the owners of the Imo, in which each ship is claiming two million dollars against the other, was completed to-day. Without leaving the bench, Mr. Justice Drysdale gave his decision that the Mont Blanc was wholly to blame, and he said he would file a memorandum accordingly. The damage would be assessed in the regular way, against the owners of the Mont Blanc.

**Fort William.**—The icebreaker Whalen is to start out at once, according to instructions received from the east by the Canadian Towing and Wrecking Company. Ice conditions are about same as last year. It is expected everything will be ready. Navigation is to open April 21. Last year ice-breaking was commenced April 6. At the Soo, navigation is expected to open between April 18 and 20. This cancels recent orders of the Minister of Marine and Fisheries, saying that the government would not have any ice-breaking done at the head of the lakes this spring.

**Toronto.**—Mayor Church is very dissatisfied with the announcement from Ottawa that the Government will place orders for building four ships only with Toronto firms this year. So he has wired ex-Controller Foster, M.P., requesting him to arrange for a conference with the Government at an early date so that the question of shipbuilding may be thoroughly discussed and the advantages of Toronto for that class of work may be laid before the Government. His Worship said orders for at least 20 vessels should be placed in Toronto.

**New York.**—For the first time in nearly a year there was noted to-day a stiffening in private war risk insurance rates for vessels destined to ports of the United Kingdom. Rates quoted to-day by leading insurance brokers showed an advance from 3½ per cent. to 4 per cent. for belligerent ships, and from 6 to 8 per cent. for unarmed neutral vessels. The advance in rates, it was said, was occasioned by the increased number of ships reported sunk last week, news of the torpedoing of the White Star liner Celtic, and fears of the present insurance men that better weather in the war zone would favor the submarines.

**Galt.**—J. H. Hancock, secretary of a special committee representing Kitchener, Galt, Brantford, Port Dover and intermediate towns, has arranged through

F. S. Scott, M.P., for a conference with Hon. Frank Carvell, Minister of Public Works, regarding the improvement of the harbor and docks at Port Dover. A delegation numbering more than twenty is to go to Ottawa. The chief object is to make it possible for the Lake Erie & Northern Electric Railway to connect with a ferry service so as to provide a short haul for coal and other raw materials from the United States for this industrial district.

**Halifax.**—The appointment of the new harbor master will probably be made next week, as according to experts the inland navigation will probably start in a few days if the present weather keeps on. Since the tragical death of Captain Murray in the Halifax catastrophe, many names have been suggested as successor of the deceased, but it is now reported that at last the government has chosen the man who will occupy the position, and it would be a very well-known navigator of this city. The first boat to leave for the Gaspe coast, will, according to information, be the Marie Josephine, chartered by the Dominion Fish and Fruit Co., and it will bring back a cargo of fish to be sold in Quebec.

**Port Huron, Mich.**—The invoices and shipbuilding plant of the Reid Wrecking Co. will be merged with the Foundation Co. of New York. The Foundation Co. is a large construction concern, which of recent years has branched out extensively into marine work. They laid the foundation of the Woolworth building in New York, and of the Dime Savings' Bank building, Detroit, as well as doing the work at the Sault Ste Marie locks. The drydock here will be lengthened to 625 feet, and 1,500 men will be employed. Keels for ten steel vessels of 150 feet in length, to be used as trawlers, will be laid as quickly as possible, delivery to be made before the close of navigation.

**Montreal.**—A slight movement of the ice in the St. Lawrence River opposite St. Lambert has taken place. Special interest is attached to the present shove by reason of the fact that the movement has started about two miles above the Victoria Bridge, which is about half a mile above the area where the break usually takes place. There are two narrow strips of open water along the north and south shore, while open water is also visible in the centre of the river below Victoria Bridge. So far there has been no damage by water, but the road on Front Street near Coteau Rouge is covered by about four inches of water. The police authorities are of the opinion that, unless exceptionally warm weather sets in, the general movement of ice will not start for some days yet.

**Port Arthur.**—A unique event occurred at the plant of the Port Arthur Shipbuilding Company at noon on April 4, when the freighter "War Isis," built to the order of the Imperial Munitions Board, full canal size, was launched. One hour after a trawler was launched at the same plant. While the freighter was still rocking in the water off the dock after her first launching, the keel plates for another freighter were laid on the same

shipway as that just vacated by the newly launched steamer. This freighter, 261 feet over all, will also be built for the Imperial Munitions Board, and another freighter for the same order is now half-plated and on the road to completion. As soon as building berths are vacated more large freighters will be built. Many trawlers are also on order, and much repair work on boats which have wintered here prior to the opening of navigation. Thirteen hundred men are now employed at the plant.

**St. John, N.B.**—War traffic continues to make heavy demands on the port facilities at St. John, and there is every indication that conditions after the war will call for still greater accommodation for the growing trade of the country. To meet these conditions, Lieutenant Harold Manning, a member of the engineering staff of the Dominion Public Works Department before going overseas, and who had an opportunity to study port development while in Europe, has prepared a comprehensive plan which has been submitted for the consideration of the citizens. His plan calls for three new breakwaters which would completely enclose the harbor and make it one of the largest and safest on the Atlantic coast, providing wharf accommodation for ninety-three steamers without crowding. The plan includes the reclaiming of a large area of shoal ground at the present entrance to the harbor. He estimates the cost of the work outlined at $5,000,000, a much smaller sum than any previous plan suggested for providing anything like the same amount of accommodation.

## INCORPORATIONS

**The Tallman Brass & Metal Co.** has been incorporated by J. N. Tallman, W. N. Tallman, A. H. Tallman, I. Tallman and M. Tallman, to take over the business of the Tallman Brass & Metal Co. of Hamilton. The capital is placed at $800,000, and the place of business is Hamilton

**The Interurban Engineering Co. Ltd.** has been incorporated at Toronto to manufacture, sell and deal in machinery, motors, electrical apparatus, etc. The share company is placed at $35,000, with the following as provisional directors: E. Smily, B. Williams and W. Rhodes.

**The Unilectric Co. of Canada** has been incorporated with head office at Edmonton, with capital stock of $25,000, to carry on business as mechanical and electrical engineers, contractors, etc. The incorporators are C. McMann, J. R. Ulery, G. B. O'Connor, G. H. Beaudry and B. Simmerman.

**The Forbes Corporation, Ltd.** has been incorporated with capital of $50,000, with head office in Montreal. They are entitled to purchase, contract for, sail, etc., vessels and steamships, tugs or barges. Incorporators: J. J. Creelman, S. C. Demers, J. B. Henderson, B. I. Brandt, J. F. Lindsay.

**The Harbison-Walker Refractories Ltd.** has been granted incorporation. Head office, Montreal, and the incorporators are L. A. David, L. P. Crepeau, S. H. R. Bush, G. Whittaker and J. P. Callaghan. Capital placed at $10,000. Company will lease and prospect mineral lands of coal, clay, magnesia, etc.

**The Great Lakes Oil Refining Co.** has been incorporated, with head office in Toronto and share capital of $1,750,000. The company can prospect, develop, explore and maintain oil wells, gas wells, etc. The directors are J. H. Spence, G Cooper, H. A. Hall, L. M. Heal and E. Staples.

**The Churchill Mining and Milling Co.** has been incorporated with head office in Toronto, for the purpose of leasing exploring and developing ores, metals and minerals. The capital is placed at one million ,and the provisional directors are: G. A. Young, E. Whitehead, H. Young, L. Leigh and D. A. Sheriff.

**The Universal Car Co. Ltd.** has been incorporated with head office in Toronto, and capital of $60,000 to manufacture, buy, sell, etc., automobiles, accessories, and conduct a garage business. Provisional directors, G. H. Sedgewick, J. Aitchison, A. B. Nind, D. A. McCrimnon and M. Tomlinson.

**The Lauder, Spears & Howland Ltd.,** has been incorporated with head office in Toronto for the purpose of dealing in lumber, timber and pulpwood, etc., and manufacture of same. The capital stock is $250,000, and the provisional directors are W. W. Vickers, H. Wilson, R. F. Angus, C. I. Macartney and H. Quigley.

**The Continental Chemical Co., Ltd.** has been incorporated, with head office at Kingston, for the purpose of dealing in chemicals and working and developing mineral lands and rights. The capital is limited to $100,000, and provisional directors are E. D. Chaplin, A. MacKinnon, J. G. Bogart, C. C. Nash and P. H. Hyck.

### TRADE INQUIRIES

THE following trade inquiries have been received by the Department of Trade and Commerce, Ottawa. Further particulars may be obtained on application to the inquiries branch.

**Agricultural and Mining Machinery, Motor Cars, etc.**—A South African correspondent, now on active service in France, wishes to get into touch with Canadian manufacturers of agricultural implements, mining machinery, motor cars, etc., wishing eventually to appoint an agent in South Africa.

**Tools.**—A South African commission agent, covering all centres of South Africa, with permanent sample rooms in Cape Town and Johannesburg, is prepared to take up Canadian representation of tools of all kinds.

**Machinery for Wood Turning.**—A Cape Town firm makes inquiry for the supply of a small wood-turning machine for turning out wood-blocks of several sizes. Sample of standard size of block with the Department of Trade and Commerce.

**Wire.**—A Johannesburg firm requests samples and quotations of plain and barbed wire.

### PITTSBURG MARKET REPORTS

(Continued from page 396.)

and launchings has been inaugurated. Such a statement for March was given out early in the week, showing 27 steel vessels launched, with 201,286 tons deadweight capacity, but next day a conflicting statement was made, referring to 30 vessels of 219,586 tons deadweight. About one-half gross ton, or a trifle more, of finished rolled steel is required per deadweight ton of vessel. Thus the steel involved in the March launchings was not over 125,000 gross tons, not much against a total productive capacity of 3,000,000 gross tons a month of all forms of finished rolled steel, but the steel now being shipped, representing launchings in future months, is presumably at a considerably heavier monthly rate.

Orders for the 100,000 freight cars involved in the Railroad Administration's program have not been allotted, but probably will be soon, covering about 50,000 box cars, wooden superstructure, 25,000 gondolas and 25,000 hoppers, the gondolas and hoppers being all-steel construction. The 100,000 cars represent about 1,000,000 gross tons of finished rolled steel, and this may involve deliveries at the rate of 175,000 or 200,000 tons a month while the cars are being built. Ships and cars together, however, do not promise to take nearly as much steel as many observers have seemed to expect.

## WAITING NOW FOR MORE PARTICULARS

**Announcement of Coming Sweeping Embargo List Causes Speculation**

CANADIAN dealers are not sure to what extent they will be affected by the embargo on goods from U.S. to Canada. It is likely to be followed by another embargo on goods from Canada to United States. While the immediate effect of the ruling might be considered as equal to a protective tariff for Canadians, manufacturers are not in a hurry to accept it as such. They point out that the whole arrangement is primarily for the purpose of equalizing the trade balance between United States and Canada, which has of late been very much against this country. Canadian dealers were alarmed when the rate was around the 1½ per cent. mark, but now that it more often hits the 2 per cent. margin, it is even worse. They are not quick to look upon any deal put through for the purpose of helping out an abnormal situation as one under which they would care to launch out on new or more work.

Jobbers have not been able to figure out exactly how it is going to affect the various lines they carry. They point out that it often takes many weeks for the influence of such a change to work out to its full extent.

## FOR SALE

FOR SALE — PLATING AND POLISHING [illegible] equipment at a low price. Must be sold and [illegible] Gurney Stove & Foundry Co., Hamilton. (tf)

FOR SALE MACHINERY HEAVY BENDING brake, power punch, foot punch, folding machine, [illegible] exhaust fan, double spindle polishing lathes, upright drill, circular [illegible], two anvils, eight vises, and miscellaneous tools. Bargains for quick sales. [illegible] Stove & Foundry Co., Hamilton. (tf)

15 x 8 SEBASTIAN LATHE, $125; 20" BARNES [illegible] power feed drill press, both excellent condition. Massecar, 163½ Church Street, [illegible]. (c15m)

FOR SALE ONE NATIONAL BOLT CUTTER with complete set of die holders for bolts up to [illegible] in size. Machine is in excellent condition and practically good as new. Canadian Blower & Forge Co., Kitchener, Ont. (c15m)

SECOND-HAND DIRECT CURRENT GENERator, 60 k.w., 110 volts, 680 r.p.m., compound wound; can be used as 880 h.p. motor. Helena Costume Co., 190 King Street, London, Ont. (c16m)

FOR SALE—NO. 2 CLASS F. REEVES VARiable speed transmission, 12 h.p., also Granger three-roll steam polisher, rolls 16 in. dia. by 36 in. long. Apply Box 205, St. Catharines, Ont.

FOR SALE.—ONE BAND SAW; FOUR-SIDED moulder; double shavings fan, 14" opening; single shavings fan, 14" opening; wood split pulley, 8½ ft. diameter x 12" face; wood split pulley, 6 ft. diameter x 14" face; 18" rubber belt in good condition, about 50 feet. Address St. Marys Wood Specialty Co., Ltd., St. Marys, Ont. (c16m)

## FOR SALE

FOR SALE LOGEMANN HYDRAULIC BAling Press, No. 1-P, with No. 1-A pump, with or without motor. First-class condition. Immediate delivery. Low price. Also [illegible] furnace and miscellaneous equipment for sale. Metal Drawing Company, Limited, St. Catharines, Ont., Can. (c16m)

## WANTED

ADVERTISER WOULD PURCHASE SECONDhand punch press if in good condition. Press must have at least three-inch stroke and weigh five thousand pounds or more. Either back geared or direct drive. Box 395, Canadian Machinery. (c16m)

### REPRESENTATIVES WANTED

TO HANDLE ONE OF THE BEST FACTORY trucks on the market. Man devoting a fair amount of attention to this line will be able to make good thing out of it. Give particulars (in confidence) of lines you are now handling, etc. Box 392, Canadian Machinery. (c17m)

CANADIAN AGENT WANTED TO HANDLE line of drinking fountains made in Canada. Man calling on manufacturing plants, public buildings, etc., preferred. Box 393, Canadian Machinery. (c16m)

WANTED—250-ton Hydraulic Press with 30-inch platen, high and low pressure control, complete with accumulator and pump. Canadian Hart Wheels, Limited, Hamilton, Ont. (c17m)

WANTED — IMMEDIATELY ONE SECONDhand compound rest lathe, back gear 4 ft. to 6 ft. bed. Also one shaper 12" to 18" stroke. Central Tools & Forgings Ltd., Winnipeg. (c18m)

## HELP WANTED

SUPERINTENDENT WANTED IN CANADIAN factory who is capable of handling a modern, up-to-date plant manufacturing high-grade automatic screw machine products. Must have undoubted ability to demonstrate machines, train operators, maintain organization at high state of efficiency, and handle help so as to get maximum results at minimum costs. Situation permanent to a live wire. Apply Box 394, Canadian Machinery. (c15m)

## PATTERNS

TORONTO PATTERN WORKS, 65 JARVIS Street, Toronto. Patterns in wood and metal for all kinds of machinery. (cfm)

## SPECIAL MACHINERY

H. C. THOMAS, GENERAL MACHINE SHOP. tools, jigs and machine repairs. 301 King St. W., Toronto. Telephone Adelaide 3836. tf

MANUFACTURERS—WE CAN UNDERTAKE work to any specification—munition production equipment or otherwise. Write W. H. Sumbling Machinery Co., 7 St. Mary St., Toronto.

JAMES BAIN & SON, GENERAL MACHINists, Hamilton, Ont. Machinery repair work. Special machinery built.

### SAW TABLE

Goldie McCulloch saw table for sale—in first class running order; carries 18" saw with mitring and cut-off attachments. Countershaft attached to frame. All boxes and working parts in first class running order. Saw raises and lowers automatically. Arbor particularly in good shape. Will sell at bargain.

J. RODERICK & SON, St. John, N.B. (c16m)

## Manufacturers' Opportunity

Our capacity being totally absorbed by increasing business in our transmission lines, we have decided to dispose of the following:

100—½ and 1 ¼ H.P. air-cooled gas engines in semi-finished condition, with patterns, jigs, etc.

Patterns, gauges, jigs, special machinery for manufacturing three sizes of threshers, very well known in Province of Quebec.

Patterns, gauges, jigs, etc. of 26" band saw, jointer, cordwood saw bench.

With this equipment is included all drawings, cuts, shop details and present repair business and good-will of the company in above lines.

Attractive bargain to serious party. Apply to The A. Bernard Industrial Co., Fortierville, Que. (c16m)

## MACHINE TOOLS

In stock and offered for sale:

Lathes

1 "New Haven" 32"x14'-0"
1 "Norwood" 22"x7'-0"
1 "Petrie" 20"x8'-0"
1 "Bullard" 20"x12'-0"
1 Hydraulic press 14" x 24'
1 Hydraulic press for copper bands 4.5 to 6"

Write for details and prices.

### AUTOMATIC GEAR CUTTERS

2—No. 13 Spur and Bevel Gear Cutters
2—No. 3-36 Spur Gear Cutters.
6—No. 3-26 Spur Gear Cutters
1—No. 6 Fellows Gear Shaper

All the above in good condition and in stock for immediate delivery.

**Riverside Machinery Depot**
19-29 St. Aubin Ave. - Detroit, Mich.

## MACHINING EQUIPMENT FOR 4.5 HOWITZER SHELLS FOR SALE

4—Hall cut-off machines, six inch.
2—Heavy duty lathes.
3—Cornadson turret lathes.
2—Bullard boring machines.
1—Jones & Lamson reciprocating lathe.
8—Davis turret lathes, with cross slide feed.
2—Thread millers for nose.
1—Holden Morgan Miller for base end.
1—Nutting mills, Monarch Brass Co.
1 Wiping attachment.
1—Copper band turning attachment (Lymburn Co.
1 Banding press.
1 Base plate machine.
1 Hydraulic pump, accumulator, 150 ton press and two nosing presses.
3 Sets Canadian Fairbanks Morse balance scales, 100 lb. with weights.
5 No. 5 Crane covering trucks.
1 8" x 12" Curtiss inlet Class "D" Standard Cross Compound Belt-driven Air Compressor.

Also lathes, cranes with 8 steel cranes, varnish tank, pumps, oil stand, shaving cradle, bench, vise, painting machine and racks for 400 shells, etc.

**Apply-McGREGOR & McINTYRE**
LIMITED
**TORONTO, ONT.**

SPECIAL SHELL MACHINES AND CONVEYOR

# Manufacturing the 75 mm. High Explosive Shell

By J. H. Rodgers †

Part I.

FACILITIES for the production of munitions under the most modern practice differ very largely from what was originally adopted during the early stages of this work. The utilization of special equipment has been one of the chief factors in the solution of the shell-making problem, and the firm of Lymburners, Limited, were among the pioneers in the development of single purpose machines for shell making, the progress made in this connection being particularly emphasized in the machining of the American 75 mm. shell were described.

†Associate Editor, CANADIAN MACHINERY.

### Plant Layout and Equipment

In the machining of shells under present-day practice one of the principal factors in economic production is in the routing of the work as it progresses through the shop from its initial operation until the shell is finally completed and ready for shipment. Overlapping of the work is not permissible if maximum efficiency is the objective, and it is, therefore, imperative that the arrangement of the equipment be such as to avoid any excessive delay or confusion while the material is being transferred from one operation to another or from one section of the plant to the other. Plants that are specially constructed for the manufacture of certain products can be so designed that facilities enable the highest percentage of effective work to be obtained; but where the building must be constructed on restricted area, or where it has been used for other lines of manufacture, the best results are not always to be had.

The plant dealt with here consists of a three-storey building, partly of recent construction, and the entire floor space is utilized at present for the manufacture of the 75 mm. American shell. The ground floor is utilized for machining from the initial operation of cutting off to the first Government inspection—the second floor is used for the operations of swedging the nose to the washing of the shells—the top floor is reserved for the final operations of swedging the copper band to third Government inspection and packing.

With the exception of the equipment in the heat treating department, the New Britain machines, the Ford Smith grinders, and the presses for assembling the base plates, the machinery has been designed by L. A. Desy, chief engineer, along with other heads of departments. These machines have been developed from the experience acquired through the manufacture of other types of shells, and their efficiency as producers is amply demonstrated by the record of their performance. These machines have been designed to obtain the maximum of power with the minimum of floor space. With the objective of 8,000 shells per day the machines have been placed so that no trucking is required in any of the departments, the shells being transferred from one machine to another by the adoption of ramps located between the various machines. Shells move across the room from one group of machines to the next until they reach the conveyer on the opposite side. This conveyer carries the semi-finished shells to the first in-

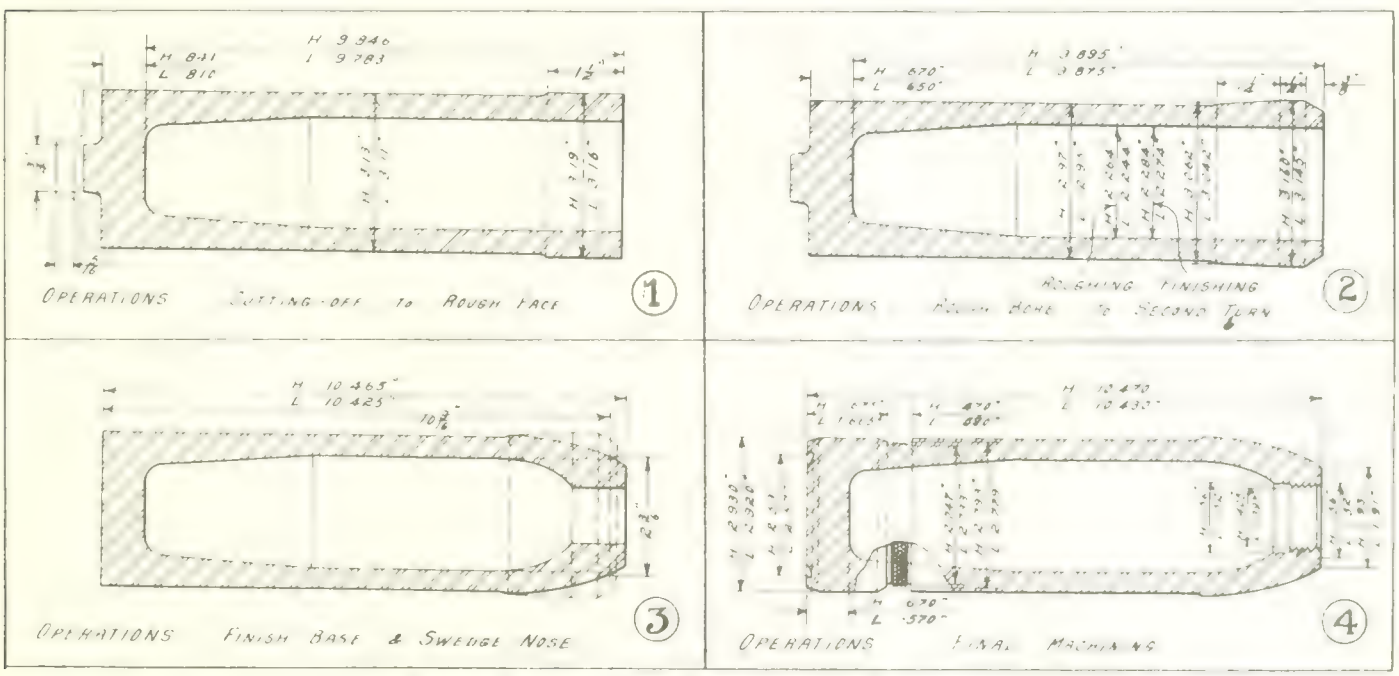

CHART SHOWING THE FOUR GROUPS OF OPERATIONS PERFORMED ON THE SHELL DURING MANUFACTURE

process is followed on the other floors, so that in no instance does the shell "back up." Some little trucking is required in

### General Shop Features

Gravity system of lubrication has been installed for the cutting tools. Individual chip pans have been provided on most of the machines, and those that are not so equipped are placed in specially constructed sheet iron floor trays. From these the lubricant is drained through perforated pieces into piping that leads to a central well, whence the liquid is pumped to a large tank located on the ceiling of the top floor of the building. As can be seen

ficult matter to keep anything like an accurate check upon the output unless some method is adopted to maintain a record of the shells at certain points in their semi-finished condition. This plant has adopted a system of automatically counting the shells at stated periods in the shell development that virtually eliminates any possibility of miscalculation in the number of shells—passed and rejected—that are handled by the many operators during the entire day. The fact that the plant is operating three shifts of eight hours each adds to the liability of mistakes or errors arising from the changes necessary in the different shifts. Seven points have been selected—following the rough facing, final base facing, passed first Government inspection, passed body grinding,

are given the second Government inspection for the major portion of the shell dimensions. Following the varnishing of the interior the shells are ready for the final inspection. As the shells are sprayed they are placed on specially-constructed four-wheel trucks that ride on the top of the inspection room tables. The platforms of these trucks are provided with shallow recesses, in which the shells are placed nose upward.

Each truck has a capacity of a hundred and travels along rails located on the outer edges of the tables. When fully loaded the trucks are pushed along to the end adjoining the Government weighing scale. In this way the inspector can take the shells from the truck and place them on the scale without moving from his chair; when a truck is empty it is re-

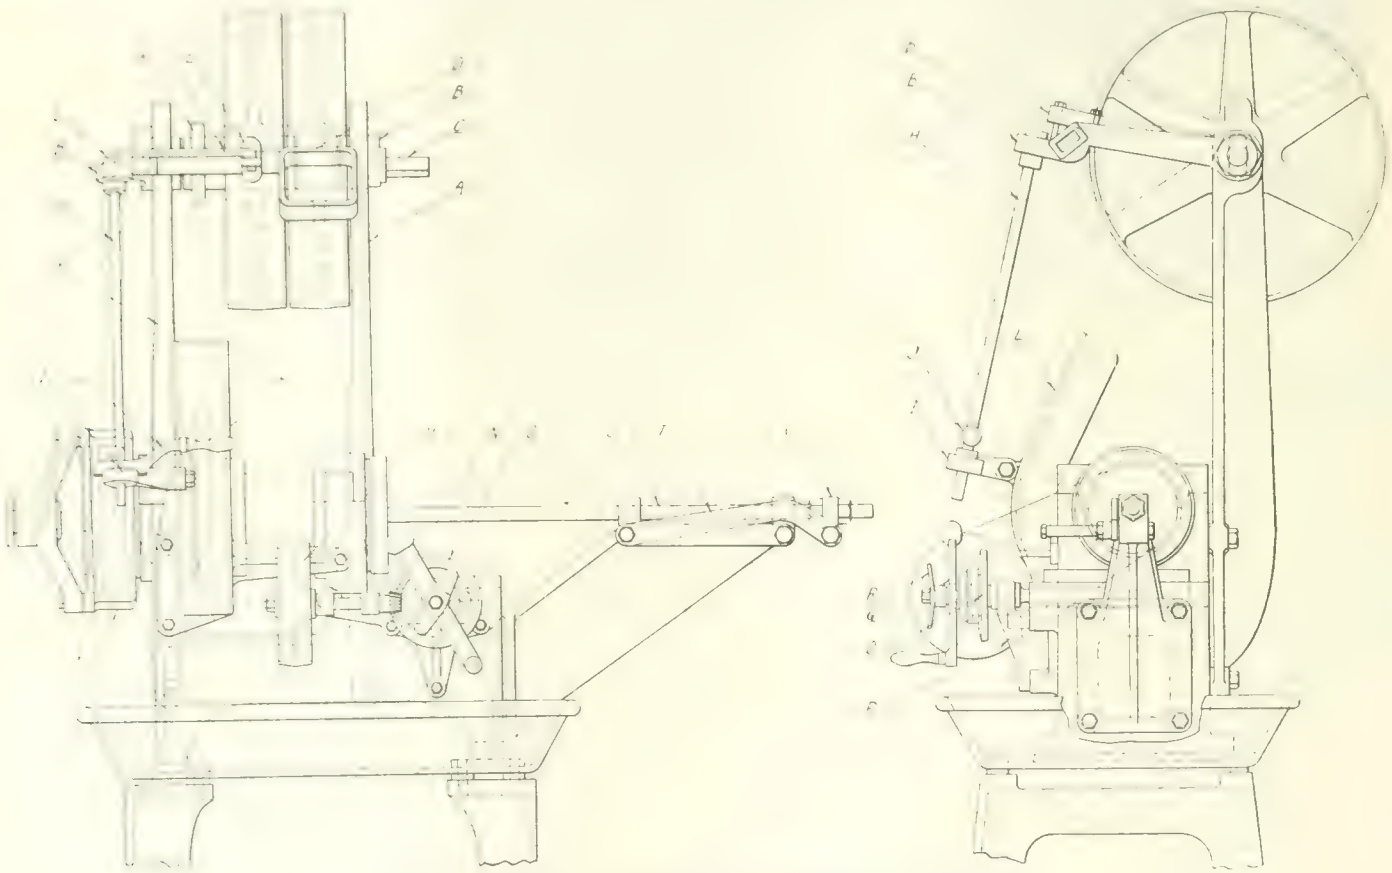

FIG. 1. ASSEMBLY OF FACING AND CUTTING OFF MACHINE.

in some of the illustrations herewith, the delivery pipes for this system are located at a low level and firmly attached to the framework of the machines and to the pillars of the building.

Another feature in connection with the general piping installation is the identification system, whereby all pipe lines are painted in different colors, to distinguish clearly the particular purpose for which they are used. Wherever possible the driving motors have been placed on the ceiling, so that all available floor space can be utilized to the best advantage for actual production.

### Daily Automatic Counter Record

Where work of this character passes through in such large quantities and also in such regularity it is very often a dif-

passed washing, passed band turning, and passed to shipping room. By checking up the reading of the counters and the number of "rejected" shells at any of these points it is a relatively easy matter to keep an accurate tabulation of the progress of the work.

### Inspection and Tests

The first Government inspection takes place after the finish facing operation, and just previous to the shells being removed to the second floor. This examination covers the close visible inspection of the bore and also dimensions; when passed, the shells are stamped with the Government acceptance stamp and placed on the elevator and taken to the heat treating department. Prior to pressing on of the copper band the shells

moved from the table and carried to the opposite end, as it is very light and can be handled by a boy. The order of the inspection details are weighing, copper band, base plate, thread gauging, stamping Government acceptance, noting heat number, stamp lot number by machine, after which they are ready for lacquering. Power machines are used for the gauging of the thread; the base of the shell is placed in the top end of a revolving shaft (operated from beneath the table) and the gauge applied. If the gauge will not go, the additional friction prevents the shell from turning, so that it can be removed with very little trouble. The shells are run through in lots of 10,000.

### Details Relative to Forgings

The identity of all forgings supplied

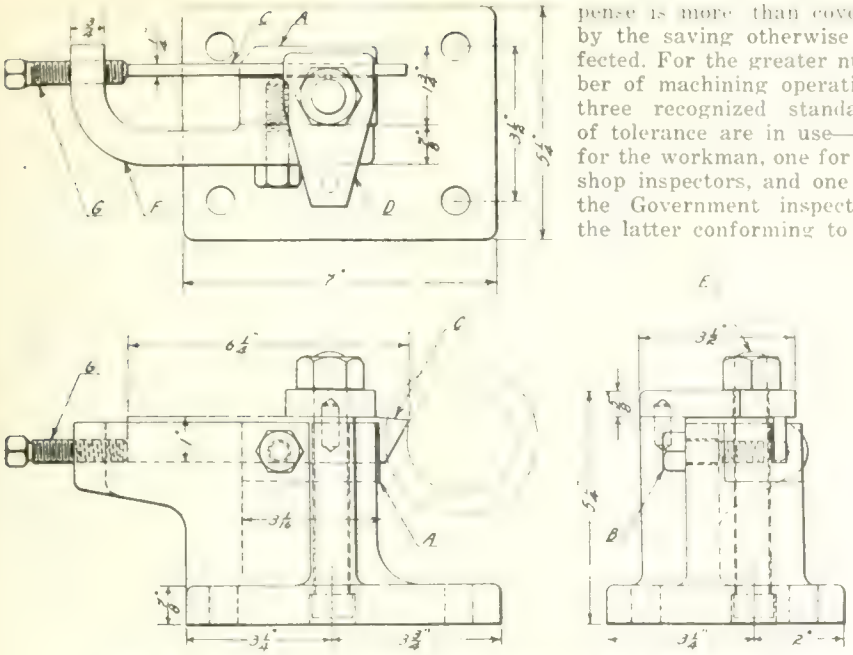

FIG. 2 TOOL POST DETAILS FOR CUTTING OFF MACHINE

by the Government for machining is established by a code letter and number designating the steel maker and heat number respectively; a letter is also used to indicate the class of steel from which the forging has been made. In addition to this a complete record of the physical and chemical tests accompanies each series as a guide to the manufacturer in matters relating to heat treatment. Throughout the process of machining care is exercised in keeping heat series from becoming separate, so as to facilitate the progress of the work. It is quite obvious that certain invisible defects may get past the forge plant inspector. Unless the machining manufacturer can show positive proof that the dimensions of the forging are such that it is impossible to obtain the same he will be held responsible for rejected shells, as incorrect centring may bring about the same result. Shells showing material defects (such as seams, cracks, piping, scale, pockets, forge marks, etc.) are promptly referred to the Government inspector, and he decides as to their disposition and establishes responsibility.

### Reclaim Department

Experience has shown that the efficiency of munitions production has been to a large extent dependent upon the elimination or minimization of spoiled or rejected shells. Apart from the physical defects that are very often unavoidable in the raw material, the bulk of the work that fails to pass inspection is due to the carelessness of the workmen, either in the heating, the machining, or the gauging of the semi-finished shells. In order, therefore, that the accumulation of doubtful shells may be reduced to the lowest possible figure, this firm has adopted what is known as a reclaim department, and its effectiveness as an important factor in manufacturing has been amply demonstrated by the results obtained.

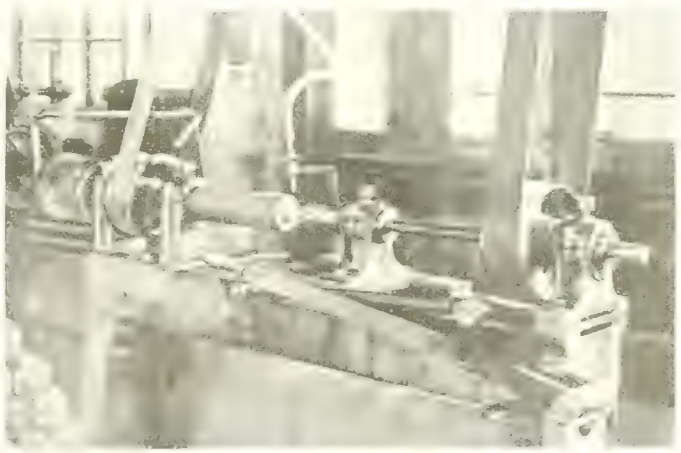
The system involves the use of many additional gauges, but this initial expense is more than covered by the saving otherwise effected. For the greater number of machining operations three recognized standards of tolerance are in use—one for the workman, one for the shop inspectors, and one for the Government inspectors, the latter conforming to the specification of the American Government for that particular type of shell. For instance, we will suppose that the specified outside diameter of the shell body is 2.925 inches, and the allowable variation is .005 above and below this dimension, this gives a tolerance of .010 inch. Then the tolerance of the shop inspector's gauge may be .008 inch and that of the workman's gauge .006 inch, the mean diameter in each case being constant. By this method it is obvious that greater accuracy is required from the machine operators owing to the closer allowance of error.

A factor that tends to more careful application on the part of each operator is that he is not credited with those shells on which the "no go" gauge goes in or over, even though the shell may be within the specified limit of tolerance. When an operator gauges a shell after the machining has been performed and finds the "no go" gauge will go the shell is labelled with a [illegible] card, indicating the nature of the defect, the number of the machine, the operator's number, and the shop inspector that has made the rejection. The use of the defect card has a three-fold purpose—to avoid the possibility of the "reject" being placed with "passed" shells, to enable a record to be kept of the efficiency of the machine, and to maintain a check upon the operator responsible. The red card does not imply that the shell is spoiled, but signifies that it must be forwarded to the reclaim department for further inspection. As a greater tolerance is permitted on this subsequent gauging it is very seldom that the shell cannot be reclaimed. This may appear to be a hardship upon the operator, as he receives no remuneration for his work, even though the shell passes the final or intermediate inspection; however, practice has shown that the system works entirely satisfactorily, as the men exercise greater care in the machining of the work. It also assists the foreman or the superintendent in keeping a close check upon each machine and its operator. If an unreasonably large percentage of "rejects" are shown as coming from any particular machine or workman immediate attention is given with a view of eliminating further trouble.

### Cutting Off the Open End

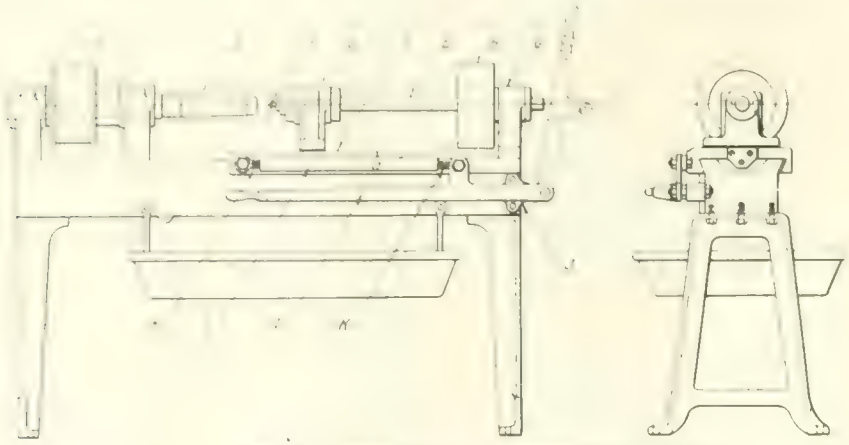
The forgings as they are received at the plant have an approximate weight of 12 lbs, an overall length of 12 inches, the internal and external diameters being 2⅜ inches and 3¾ inches respectively, with a slight taper for relief when stripping the shell from the punch and the die. Cutting off the open end is the first operation, and is performed in machines specially designed by the plant engineer for this particular purpose. An assembled line drawing of the machine is shown in Fig. 1. The adoption of a particular design of self-contained countershaft is one of the features of a large number of the machines in this plant. The use of an extra wide belt from the lineshaft to the countershaft, together with the application of the short chain belt from the latter to the machine spindle, provides a very powerful drive and the necessary speed reduction.

The two upright supports A are secured to the rear of the machine frame,



[illegible]

the upper ends carrying the countershaft. On the outer ends of the arms B an oblong slot is located to carry the shifter rod C, to which is secured the shifter D and the bracket E. The link F connects this bracket with the piece G, the hub of which revolves in the extension of the left side shifter arm. Through the centre of the piece G is a square cored hole into which the rod H is inserted, the lower end carrying the shifter handle J and supported in the bracket I fitted to the chain guard L of the machine. K is the sprocket pinion secured



ASSEMBLY OF CENTERING MACHINE

ment R. A bracket is fitted to the right-hand end of the machine to carry the gauging S, which is operated by the toggle T. By means of the collar U and the two locking nuts the position of the rod S can be accurately adjusted. When placing the shell in the chuck the end of the rod S bears against the inner base of the forging, the action of a spring within the chuck assuring exact setting of the shell. When the air is released the shell is automatically ejected from the chuck.

The design of the tool holder used on the cutting-off machine is illustrated in Fig. 2. The casting forming the body of the fixture is secured to the cross slide of the machine, and to the upper portion is fitted the tool steel hardened block A; this block has a slot shaped in it to receive the cutting tool C. The block is held in position by means of the cap screw B, while the tool is clamped by the strap D and the bolt E, the latter passing entirely through the block. Extending from the main casting is the arm F that carries the set screw G for adjusting the cutting tool. The tool is made of ¼-in. by 1-in. high-speed steel. The shell after cutting off the surplus stock at the open end has a mean length from the inner base of 9.815 in.

### Centring the Base End

While the operation of centring the base is apparently of minor significance, the importance of this detail and the bearing it has on subsequent operations cannot be over-estimated. One factor influencing the successful performance of repetition work is the accuracy with which the primary operations are performed. In addition to the rapid handling of the shell from one machine to another, it is necessary that the various machine operations be accomplished as rapidly and accurately as possible. Fig. 3 shows a view of one of the machines used for the centring of the rough forging and also for the recentring of the shell after the base has been roughed off. The arbors used on these machines are of the expanding type, the jaws being operated by the action of a central draw rod secured to the piston contained in the air cylinder at the rear of the main spindle.

It will be noticed that the machine is of the double-acting type, the spindle with the shell revolving in one direction, while the drill spindle revolves in the opposite direction; this method insures the centre being in accurate alignment with the bore of the shell. In the sketch, Fig. 4 is shown a line drawing of the assembly. A is the pulley secured to the main spindle, and B is the expanding arbor, the pneumatic cylinder being omitted. Secured to the traverse carriage C is the housing D that carries the forward end of the drill spindle E, the tail end of which is supported in the fixed bearing G; the pulley H being so fitted to the bushing in the bearing G that it remains in a permanent lateral position. Rapid action of the centring drill is obtained by the link arrangement of the levers. The rear end of the handle I is fulcrumed in a bracket fitted to the right-hand end of the machine; the connecting rod L is adjustable by means of the right and left-hand eye bolts K. When the handle is raised to a vertical position, as shown by the dotted line, the drill has been removed to the extreme right position, leaving ample room for the removal of the shell.

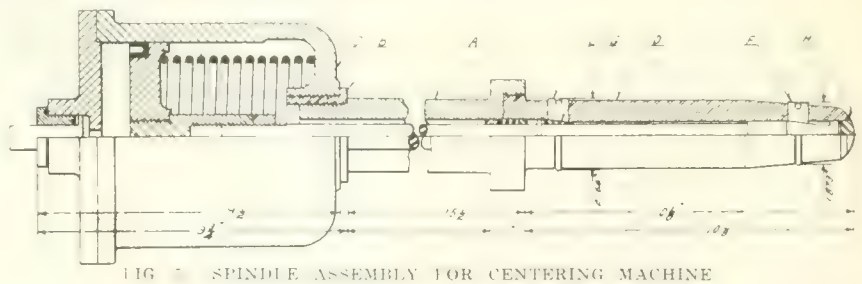


FIG. 5. SPINDLE ASSEMBLY FOR CENTERING MACHINE

The details of the centring machine spindle are shown in Fig. 5. Secured to the rear of the hollow spindle A is the air cylinder C, the bush B being used in this particular instance to fit the bore of the cylinders where the connection is made. The arbor D is threaded to the nose of the spindle and carries two sets of jaws E and F, the front set being operated by a tapered section on the draw rod and the rear set by a bush G fitted to the rod and backed up by the collar shown. The end is closed by a small steel cap H. Two machines are used on this operation, each having a capacity of 180 per hour.

### Rough Turn and Face End

Rough turning the outer diameter is the third operation. This is accomplished in 26 special Lymburner machines, each having a capacity of 17 shells per hour. The main portion of the body is turned to a mean diameter of 3.12 inches, while for a distance of 1½ inches from the open end the diameter is left 3.175 inches. First setting of the tool only is required on these operations, as once the set is adjusted for the proper size, subsequent shells are turned almost automatically; this is done by means of a cam placed at the front of the machine and just back of the cutting tool. This cam is supported on an extra heavy cast iron beam fixed at either end to arms extending out from the headstock and tailstock respectively. This arrangement not only assists in taking the end thrust of the axial pressure, but adds considerable rigidity to the cutting tool, it being held in a special holder of the rocker type, the outer end containing the cam point for generating the desired contour on the shell surface. One-half inch Stellite is used for rough turning operations. The machines are similar to those used on the boring, with the exception of the carriage and the tailstock. These machines are also fitted with the machine countershaft and Baldwin chains are used from the overhead shaft to the gear on the spindle.

Following the rough turning, the base is faced off to a mean thickness of .825 inch. Ten machines similar to those adopted for cutting off the open end are used on this operation. A double tool is used for removing the metal, the leading tool taking off the initial tit, while the second tool takes a cut across the greater portion of the base, leaving a small section for recentering. Each of these machines has a capacity of approximately 50 per hour.

### Machining the Bore

A row of special boring machines is shown in Fig. 6. Thirty-two machines are installed for performing the boring of the shells—18 on the roughing and 14 on the finishing. Both these operations are accomplished with single-pointed tools of high-speed steel, 5-16 by ¾ in.,

held in the end of a boring bar. A good general view of the machine countershafts is shown in this illustration, also the piping arrangement and the flexible lead for the cutting lubricant to each machine. The lever for controlling the air supply is shown directly above the headstock and within easy reach of the operator. It will be noticed that a chain guard has been provided on each machine for the protection of the workmen. The screw and dog for adjusting the cam contact point is shown at the extreme left end of the special arm. The traverse carriage is of ample length to insure maximum rigidity and alignment. The lubricant passes through the boring bar to the cutting point of the tool. The feed is obtained by belt drive, increased lap being given on the pulleys by means of small idlers supported in suitable brackets secured to the headstock of the machine. The profiling point is kept in contact with the generating cam by means of a spring located at the rear of the carriage. On the roughing operation the machines have a capacity of 23 per hour and the finishing machines can turn out on an average of 30 during the same period.

FIG. 6. ROW OF SPECIAL BORING MACHINES

Fig. 7 shows a line drawing of the assembled profile boring machines. In common with most of the other machines these are equipped with the overhead countershaft, but the sketch of the same has been eliminated in this view. The profiling arm A rides upon a flat surface near the forward end of the traverse carriage, from the back end of which extends an arm that carries the pivot pin B. Secured to the middle top of the arm A, and directly above the carriage bearing, is the boring bar support D. In the plan view the cam point is shown at F with the adjusting screw G, the former bearing on the cam that is fastened to the piece H extending out from the main front bearing. The clutch lever is shown at I, and J is the feed clutch. The lever I is so arranged that the feed can be automatically disengaged when the tool has reached its extreme depth. K is the feed pulley, and the adjustable idlers are shown at L. It might be here stated that in both the rough turning and the boring operations two machines are operated by one man, as the design of the machines and their location are such that this can be done very satisfactorily.

### Finishing Inside Base and Open End

After the profile of the bore has been completed the shells are passed to other machines for roughing and finishing the interior base. Eight special Lymburner machines are used for each operation, the output from each machine being about 50 per hour. When roughing the base a half width cutter is used, while a full width flat cutter is used for finishing the base to the specified dimensions. To insure a uniform depth of bore from the open end to the interior base a special cutter head is located on the boring arbor for facing and chamfering the open end. This is shown in Fig. 8. Both facing tool and chamfering tool are made of ½-inch square high-speed steel; the chamfering tool is set parallel with the axis of the bar and the angle of the chamfer is 24½ degrees with the axis of the shell; the facing tool is set at 20 degrees with the face of the work.

### Intermediate Turn and Finish Face

Following the recentring of the shells, which is performed on machines similar to those used for the initial centring, the shells are given a second rough turn. This operation is accomplished in 14 machines like those adopted for the previous turning, the capacity of each approximating 30 shells per hour. The mean dimensions after turning are 2.96 inches for the lower portion and 3.152 inches at the nose, tapered and bevelled as shown in the operation chart.

The base is now finish faced to a mean thickness of .620-inch. Ten machines similar to the cutting-off machines are used for this work and each has a capacity of 50 shells per hour.

(To be continued.)

## BRITISH AND GERMAN TERMS OF CREDIT IN THE ORIENT

THE increasing determination of British commercial interests in Hong-Kong and the Far East generally to break up the system of long credits built up by German traders in Eastern ports has been subject to continuous observation by commercial agents of other countries, particularly the United States Consul at Hong-Kong, who recently made this activity the subject of a report. This credit system, to which most non-Germans have ascribed the German success in securing trade from old-established British interests, was peculiar in the fact that it rested in turn upon British export and financial houses. So closely were the operations of these houses connected with German credits that the charge was freely made before the war, and to some extent since the war commenced, that German houses were given financial facilities which British houses could not obtain.

### German Business Methods

The examination into German methods resulting from the liquidation of the affairs of German firms in Hong-Kong has not indicated that German firms had facilities which British or other firms could not secure, but it has been the means of ascertaining exactly how German firms conducted their business. The subject is of general interest to British traders in Hong-Kong and in the United Kingdom as explaining the credit system. To American exporters it is not only interesting for the same reason, but

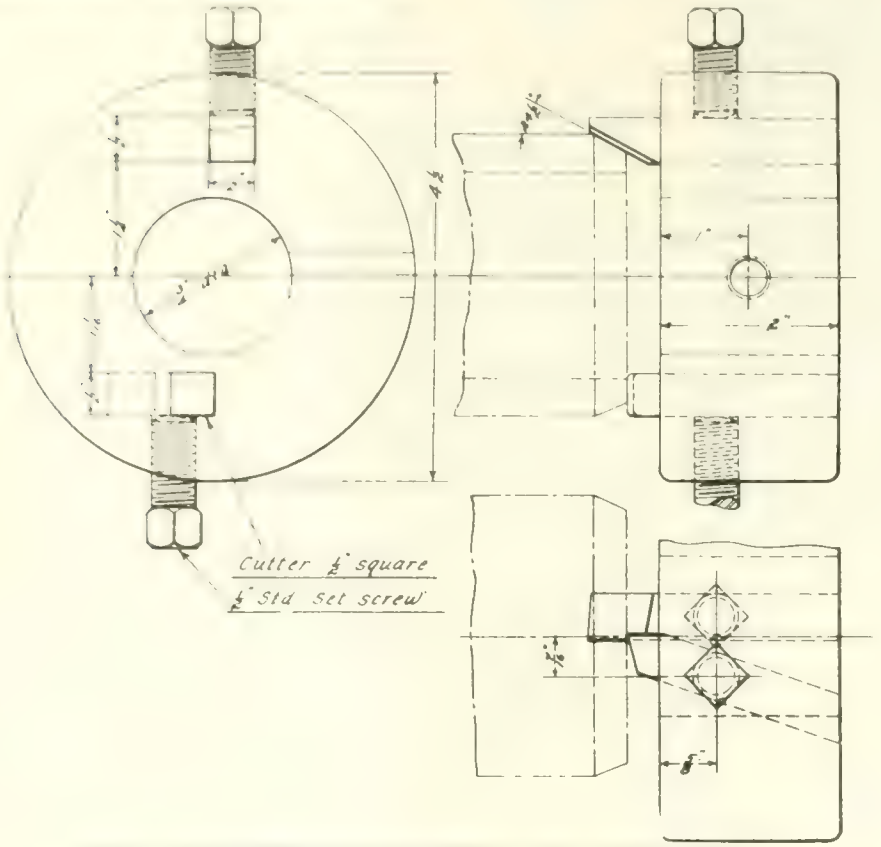

FIG. 8.—ATTACHMENT FOR CHAMFERING AND FACING NOSE

ket, which has made such houses possible and profitable.

**Financing Through "Acceptance Houses"**

An authoritative statement of the matter in its essential features appears in certain correspondence between the China Association (a London organization), the British Colonial Office, the Government of Hong-Kong, and the Hong-Kong General Chamber of Commerce, just published in the Hong-Kong Blue Book of 1917. From this correspondence it appears that German firms doing business in Hong-Kong and the open ports of China not only dealt in German products (in which trade they were aided by the German Government), but they also dealt in British goods and were financed in both cases largely by British houses and were so leniently treated by the latter that strict compliance with the terms of the financial arrangements was seldom insisted upon. As a matter of fact their trade in British and, in some cases, in American manufactures was the foundation of the prosperity of some, at least, of the leading German houses.

The manner of financing exports is succinctly set forth in a statement put before the British and Hong-Kong Governments by the China Association and the Hong-Kong General Chamber of Commerce:

"Arrangements are made with a certain 'accepting house' to accept the drafts of the shippers up to a certain amount. When the goods are shipped from Manchester, Bradford, or Hamburg a bill is drawn at six months' sight on the accepting house, which accepts it, and the drawer then discounts it in the open market. Inasmuch as the draft is fine paper, on account of the standing of the acceptor, it can usually be discounted at 1 per cent. below bank rate. The acceptor usually charges one-eighth of 1 per cent. per month for the service, and the total cost of financing is merely the accepting commission (one-eighth of 1 per cent. per month), interest at 1 per cent. below bank rate, and the cost of the bill stamps. The accepting house sends the documents, with a letter of lien attached, to its clients in China, either direct or through an Eastern bank—usually direct. The China house signs the letter of lien, returns it to London, and takes delivery of the goods upon arrival."

## WOMEN IN WORKSHOPS

From an English Correspondent.

THERE is very little attention being paid to the future of female labor in engineering, although it is generally admitted that it will be one of the most difficult problems we shall have to solve during the period of reconstruction. It is surprising that women were not engaged in engineering before the war, considering that they were employed in many industries that were manifestly less suited to them; but there is some consolation in the thought that our insular conservation was not responsible for this, as even in Germany their value was not realized until sufficient male labor could not be had.

Women have become so important a part of the producing machine now that it is difficult to see how they can be ejected from it when the most pressing need for labor is past. This is looking at it from the purely economic point of view, and ignoring the social danger that would be incurred by throwing women on the labor market. Many of them will return to their domestic duties when their husbands return from the army, but many more will desire to make their new vocation their life work, and it is in the interest of industry that they should be allowed to do so. But their sphere of usefulness is limited, and their greatest value is not realized when they are employed at work for which they are unsuited.

For example, girls or women may be useful in the core shop, but the heavy labor of the foundry floor is man's work. It would have been a wise policy if, when it was first determined to introduce women into the engineering workshops, a committee of experts had been appointed to consider any advice on the best methods of training them for suitable classes of work. We might now have had a great army of really skilled women workers who would have released more men for the colors.

It is erroneous to suppose that the only opponent of women labor is the skilled male worker. The foremen's opposition has been potent during the war. The workman's prejudice is logical, and is usually based on the fear of undercutting. The history of women in industry is not pleasant reading. Invariably she has been used to keep down the rate of wages, and consequently lower the living standard. The only way to eliminate the risk is to abolish sex rivalry. If workmen would open their unions to women they would find them loyal members of their craft. It may be admitted, however, that women in certain work require more help, because of their physical weakness, than men, and it may not be economical for an employer to pay them the same rate of wages as men. This difficulty could be adjusted amicably, however, between the workers and employers in conference.

The war period has seen new developments in engineering. The gasoline engine has advanced wonderfully, and the manufacture of aeroplanes, while it is not likely that it will continue in its present proportions, is a permanent addition to engineering activity. It is probable in this motor car and aeroplane work that women will score her greatest successes, although even in the general works there is room for her. It will be interesting to observe the effect of women's entrance into engineering on workshop conditions. She enters with a mind unbiased and unbittered by the memories of industrial struggles and unprejudiced by worn out customs.

# The Cooling of Cutting Tools: Efficiency of Modern Practice

By R. B. Huyett, M.E.

*That tool's production should have been stepped up through the ... fact of metal cutting efficiency will always remain a peculiar ... development. Much effort could have been saved had as much ... the heat of cutting as was given to finding materials to withstand it. Present practice, however, is largely a result of the path of events in the past.*

PROGRESS in the cutting of metals and, coincidentally, in the lubrication of cutting tools, can be divided into three periods of evolution. The first period is often referred to as the good old days of the backyard shop, when the boss and his workmen vied with each other in the performance of difficult work, requiring great skill, owing to the lack of proper equipment. Each shop was limited in the quality and quantity of its product to the skill of the individual workman.

During this period, the time necessary to complete a piece of work was a secondary consideration. The workman was expected to use his skill in performing the work as near perfect as possible, regardless of the time consumed in so doing. The machine tools then employed, while they accomplished wonders in comparison with hand work, were not equipped to perform the greatest amount of work in the shortest time. Lubrication of cutting tools was unheard of and unnecessary. The machines were not as yet built to run at high speeds.

The introduction of quantity production necessitated the designing and construction of machine tools of greater strength and speed. Then it was found that the cutting tools (all low carbon) would not stand up under the speed of which the new machines were capable as the friction of these speeds generated enough heat to soften the tools and make them lose their cutting edge.

### Efforts to Reduce Friction

To remedy this experiments were made along the line of reducing the friction of cutting. Friction was reduced in bearings by lubrication, why not here? So a squirt of oil now and then was tried on the theory that some might get between the tool and the work and grease the cutting edges.

The futility of trying to eliminate or reduce this friction soon became apparent as nothing could be gotten between the cutting edges of the tool and the work. It was found that a little lubricant at the rake of the tool where the chip slides back over it might do some good, but only a very little. At this time, for some unaccountable reason, it did not occur to the experimenters that, although they could not prevent the great friction at the cutting point, and in this way prevent heat, they could arrange to dissipate the heat as fast as it was generated and in this way prevent the tool from becoming the conductor and burning. Instead of developing a means of taking the heat away from the tool they developed a tool steel which, as they thought at the time, could withstand the heat. This was then called high-speed steel, and is in use to-day.

Now comes the third and present period. Machine tools are designed with much greater cross-sectional area, larger and longer bearing surfaces, special alloy steel parts and greater driving power. These improvements make them capable of such high speed as to generate sufficient heat to destroy the cutting edge of even the high-speed steel tools which had been thought immune from heat.

### Coolant Helps High-speed Steel

Up to this time the manufacturers of high-speed tools claimed that their tools should not be used in connection with coolant.

It was discovered however by users of the tools, that when a ¼ in. or ⅜ in. stream was circulated over the tool there was a very marked lengthening of a lifetime of a high-speed steel tool.

Working perhaps on the theory that if this small amount of coolant was good, more would be better, many progressive engineers tried the use of more.

Among these experimenters was Mr. Frederick W. Taylor. He arranged to circulate, without pressure, a large stream of coolant instead of the small ¼ in. and ⅜ in. streams. The results were remarkable. As much as a 40 per cent. increase in cutting speed was found possible with less deterioration to the tool and a far smaller number of tool grinds. We quote from Mr. Taylor's able work on the subject, "The Art of Cutting Metal": "When one appreciated the very small gain in cutting speed amounting to perhaps from 2 per cent. to 5 per cent. attained by the many experiments which have been made upon the exact angles to which tools should be ground and also the small practical results realized from experiments upon the pressure of the chip on the tool, and when one realized the large amount of time and expensive apparatus entailed [illegible] hand the extreme simplicity of making experiments on the effect of cooling the tool and the 40 per cent. of gain from this source, it is indeed a matter of wonder that this element has been entirely neglected.

"In cutting steel the better the quality of tool steel the greater the percentage of gain through the use of a heavy stream of water. The gain for the different types of tools in cutting is:

| | Per cent. |
|---|---|
| (a) Modern high-speed tools ..... | 40 |
| (b) Old style heavy-hardening tools | 33 |
| (c) Tempered tools | [illegible] |

To quote from a recent article by M. H. Williams, in "Railway Mechanical Engineer": "The value of having an ample supply of cooling compound flowing over the tool to properly carry away the heat generated by the cutter is hard to estimate, and without it the present high speed of milling would not be possible. Looking backwards at old practices with milling and other machines makes one wonder why we didn't flood the cutters at an earlier date. For years it had been the practice to flood the chasers of bolt cutters and taps in nut tapping machines, and we all knew the value of the same. Probably the fact that the old style milling machine was equipped with a can from which some 10 to 40 drops of oil per minute could be fed to the cutter prevented experiments of flooding cutters.

"With the advent of high-speed steel cutters and the increase of speeds it was found that the limit of speeds was reached when the chips removed showed the effect of heat by discoloration, this being an indication of dull cutting edges. Flooding the cutters with cooling compound has the effect of cooling each cutting edge of the cutter after taking a chip so that when coming into play again the edge is cool and the work is also kept cool. An article milled at high speed and also the chips show no indication of heat when handled directly after milling with a flooded cutter, but if the cooling compound is shut off the chips will discolor at once.

### Increased Coolant Cuts Costs

"Many old milling machines of the planer type used largely on rod work, also the upright type and the tool room millers as well as the plain knee type, have been speeded up above their original rate of milling as a result of the application of a more liberal supply of cooling compound. This has generally required larger pumps and piping, and where used has at times resulted in overflowing the tables, making it necessary to increase the passages from table to tank and to place extra guards around the table to prevent flooding the floor. However, where the machines have been equipped for greater supply of cooling compound the results have well justified the cost on account of a greater output from the machines. It is cheaper to speed up machines than to buy new ones.

"It is not advisable to direct the compound on the cutter with great force on account of splashing, but it is desirable to have a large stream at low pressure and for the average machine pumps to supply 10 to 15 gallons per minute answer very well."

The real function of the liquid is to carry away the heat from the tool and prevent its temper from being destroyed. Lubrication therefore is a misnomer and the word "coolant" is a much more appropriate term. We quote from Mr. Becker's able work, "High Speed Steel": "While the word is in common use in this [illegible]

speak of lubrication in connection with metal cutting. It is quite impossible to force oil or other substances between tool and chip. The purpose of the so-called lubricants in the main is merely to assist in carrying away heat from the [illegible] keeping down the temperature of the cutting edge and lip of the tool below the point where softening will begin."

### Volume of Coolant Necessary

The size of the stream of coolant to be used depends on the speed of the machine, the depth of the cut, and the kind of material. The easiest and only sure way of knowing when enough coolant is being used is to run the machine at its maximum speed from the standpoint of the strength of machine, material and tool. If the tool smokes or the chips come off hot at this speed, an insufficient amount of coolant is being used and the flow should be increased.

It is far better to use too much than too little, and Mr. Becker, in his work, "High Speed Steel," puts it this way: "The output of most old style milling machines can be about doubled by following the plan of keeping the cutters cool, and this applies to the smaller tool-room machines as well as to the larger millers. Where machines are not so equipped it would undoubtedly pay to apply a cooling compound system."

Such statements as these started investigation in the right direction and the possibilities for increased efficiency by scientific cooling of the cutting tool are gradually being more and more recognized. However, there still exists a deplorable amount of indifference to these possibilities even in many otherwise progressive shops, as is evidenced by the smoking tools and hot chips. It will pay an executive interested in everything that affects profits to investigate these conditions.

The absence of smoking tools or hot chips is not conclusive evidence that enough coolant is being used. The machines may be slowed down to accommodate the small streams of coolant being used.

The small streams customarily used are quite ineffective. It is necessary to deliver gallons of coolant where it has been customary to deliver pints. The heavy streams serve another useful purpose in cases where the chips come off small or well broken up in that they carry or float them out of the way.

### Water Solutions the Logical Coolant

Since to cool is the prime function of the liquid, it naturally follows that the best liquid to use is that which possesses the greatest cooling qualities. The lighter and therefore more easily evaporated the liquid, the greater its cooling qualities, consequently, water fills the necessary requirements when properly mixed with a sufficient quantity of some good cutting compound to eliminate the corrosive effects of water alone. Such water solutions are not only much better coolants than pure oils, but are far cheaper. Oils pick up heat slowly and release it more slowly. Water picks up heat quickly and releases it more quickly.

### Effective Application of Coolant

It is not sufficient that a copious flow of coolant be used. A great deal depends on the manner in which it is used. It must be directed at the right point and delivered at a slow velocity. Again quoting from Mr. F. W. Taylor's "The Art of Cutting Metal": "A series of experiments has demonstrated that water thrown directly upon the chip at the point where it is being removed from the forging by the tool will give higher cutting speeds than if used in any other way."

And further: "After deciding to try experiments upon the cooling effect of water when used upon a tool, it was our judgment that if a stream of water were thrown upward between the clearance flank of the tool and the forging itself, in this way the water would reach almost to the cutting edge of the tool at the part where it most requires cooling, and that by this means the maximum cooling effect of the water would be realized. We therefore arranged for a strong water jet to be thrown between the clearance flank of the tool and the flank of the forging and made a series of experiments to determine the cooling effect of water with various feeds and depths of cut. So confident were we of the truth of this theory that we did not deem it worth while to experiment with throwing streams of water in any other way until months afterwards, when, upon throwing a stream of water upon the chip directly at the point where it is being removed from the forging by the tool, we found a material increase in the cutting speed and thus our first experiments were rendered valueless.

"Practically great difficulty will be found in getting machinists in the average shop to direct the stream of water on the chip in the proper way as indicated, because when a sufficiently heavy stream of water is thrown upon the work at this point it splashes much more than when thrown upon the forging just above the chip, and a machinist prefers slower cutting speeds and less splash. However, when they are managed under the "task system" with trained speed bosses who are accustomed to obeying orders, this trouble disappears.

"The most satisfactory results are obtained from a stream of water falling at rather slow velocity, but with large volume, at the proper point upon the tool, since a stream of this sort covers a larger area of the tool and is much freer from splash."

### Most Efficient and Economical Means of Delivering Coolant

Machine tool builders as a general rule have entirely overlooked the necessity of supplying adequate coolant circulating facilities on their machines. Users found that the machines were not properly equipped to deliver sufficient coolant. In order to overcome this defect some users have gone to great expense and trouble to instal a gravity system to provide the proper flow and eliminate the troubles of the gear-type pump, such as loss of prime, clogging, short life, etc. The installation of a gravity system has cost several time per machine what it would cost to provide each machine with an efficient individual pump at the present time. By installing gravity systems users of machine tools have done nothing more than trade the troubles incident to the use of the old gear-type pump for those of the gravity system. With a gravity system in use it is necessary that all machines connected with the system use the same grade of coolant. It is unsanitary, requires constant attention, and, if the least thing goes wrong every machine connected with the system is put out of commission until the defect can be repaired.

A very large majority of machine tools are still being furnished to the users with small capacity pumps and small-sized piping. This necessitates the changing of the circulating system on machines by the users.

Although it seems a hardship to have to do so, until such time as they can insist that the machine tool builder equip machines properly, it is far more economical for the users to throw away the small capacity pump and piping than to use it. A few dollars spent to get a pump and piping of the right capacity will be saved many times over by the increase in production and the lowered tool expense.

## LUBRICATION OF SHAFTING

TO obtain efficient lubrication a film of oil only is necessary, and to get this without waste the old dodge of using twisted worsted or cotton yarn is hard to beat when properly used. The methods of application differ, although the principle is the same in all cases. A receptacle partly filled with oil forms the reserve supply, and in this there is one end of a loosely spun thread of cotton or woollen yarn, the other end being in contact with the shafting or other part to be lubricated, the oil being drawn over by capillary attraction.

The rate at which the oil passes depends partly on its viscosity and partly on the tightness with which the yarn is spun, while for some purposes a flat woven lamp wick very well supplies what is needed. No large amount of oil is needed for well-balanced machinery which is not overloaded, provided the right quality of oil is used, but it is necessary that the supply be continuous or lubrication will be inefficient. A flood of oil for half the day and dry bearings for the other half is almost as bad as no oil at all, and is avoided in good practice. It is wasteful of lubricant and harmful to the plant.

BELTS are more durable and work more satisfactorily when made narrow and thick, rather than wide and thin.—Belts.

IDLER pulleys work most satisfactorily when located on the slack side of the belt about one-quarter of the distance from the driving pulley.—Belts.

# Heat Treatment of Large Forgings: Methods and Apparatus-II*

By H. H. Ashdown

*So much lecture-matter enters into the proper method of heat treating ... the modern equipment used and the ... article is a problem in itself and ... with the various methods in use and the ... The present article deals ...*

### Pyrometers

Pyrometers are of great value and service in indicating temperatures, but in inexperienced or careless hands, they are more harmful than helpful, and so far as recorders are concerned, little value should be placed on them without knowing that careful observation had also been kept on the furnace. The record simply indicates the temperature of the area in which the pyrometer is located, Fig. 2, 10, 11, and 12, and a great diversity of temperature may often be seen in large furnaces within a few feet of this position. In the author's opinion, the greatest value of a recorder is the moral effect it has on the furnacemen. It certainly causes them to be more attentive than they otherwise might be to their fire control.

The following instance relative to the deception of pyrometers is given: Let us imagine the pyrometer being in contact with the shaft end of the forging, Fig. 12; one might then record the desired temperature for many hours, and yet the body of the forging could still be several hundred degrees below that indicated. Indeed, the author has seen comparatively small engine parts, of which, within a length of three feet, after heating and quenching, one end has been

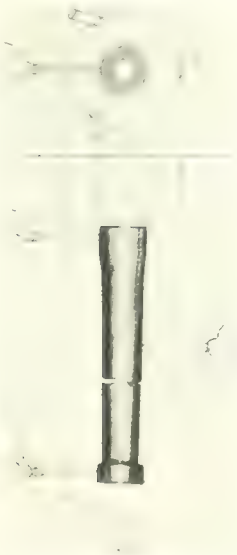

FIG. 11. ILLUSTRATING THE USE OF PYROMETER.

in its softest possible condition whilst the other end has been practically unfileable. When it is fully realized that pyrometers simply indicate a local temperature, and that uniformity of temperature is entirely dependent on careful observation, many of the so-called mysteries, together with their consequent troubles, will disappear.

Although only one form of pyrometer has been illustrated, the Fery radiating pyrometer, Siemens water pyrometer, and Brearley sentinel pyrometer, Fig. 13, have each their own spheres of usefulness. In the latter case, for instance, the sentinels can be placed in positions quite inaccessible to other forms of pyrometers and again can be laid in rotating bodies, their complete fusion denoting their prescribed temperatures.

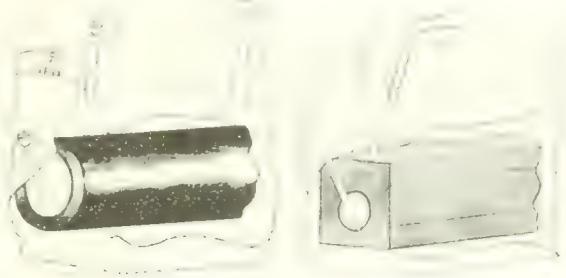

FIG. 10. FURNACE DIAGRAMS ILLUSTRATING THE USE OF PYROMETER

### Sand Annealing

When it is generally realized that forgings, after their structures have once been refined by a correct heat treatment and are quickly cooled, give better mechanical and physical tests generally, the fallacy of sand annealing will soon disappear. These remarks apply equally so to those which have been quenched and have received a subsequent light annealing or tempering to conform to specified tests. It is sometimes an advantage to bury in sand forgings made from steels akin to those exhibiting air-hardening properties, with a view to rendering them soft for machining; but if such forgings after machining are to be assembled in the machine in this annealed state, it is then better to cool quickly and reheat slightly below the change-point.

If it is intended to anneal forgings in sand with the object of softening for machining, they should be fully covered before they have fallen below the critical temperature, and for comparatively small forgings hot sand should be employed. For want of a little knowledge on this subject much apparent slackness is practised, and this in a large measure accounts often for much of the so-called hard and soft spots which cause endless trouble and expense in the machine shop.

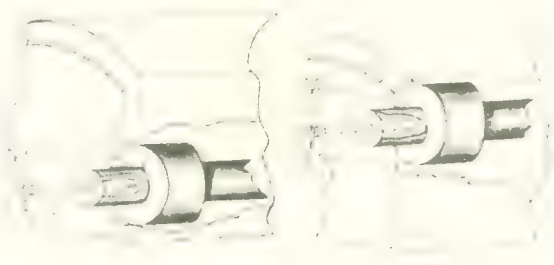
The steel- maker, of course, usually has all such troubles reflected back upon him, often being informed that his steel is badly made and wanting in uniformity.

### Oil Quenching

Attention has already been called to the want of uniformity in heating for annealing, and this applies equally to the case of forgings being heated for quenching, in order both to improve their structural condition and also to effect a certain standard of hardness. It might appear somewhat elementary to embrace such remarks as these, but when one finds that such important essentials are commonly overlooked, it is well to make it quite clear that all forgings, whatever their size, must be quenched only when uniformly heated above the change-point of the steel.

Excessive heating of forgings before quenching is not only productive of a bad structural condition, but also renders the cooling medium unnecessarily hot, and thus effects a comparatively slow cooling of the forging through its critical range, allowing partial precipitation of the ferrite to take place. It will be generally admitted that the quicker a forging can be cooled until the critical range has been passed the better will be its structural condition, and consequently its physical properties will be of a correspondingly higher order. This, in the author's opinion, is a matter deserving of closer attention than it would appear to have received in the past.

This point leads up to the liquid used as a quenching medium. The author trusts he is not exceeding the privilege conferred on him if he mentions the subject of gun forgings. Of recent years marked developments have been seen in the size and weight of these forgings, until they have assumed ponderous masses and require for their quenching tanks of oil from 8 to 10 feet in diame-



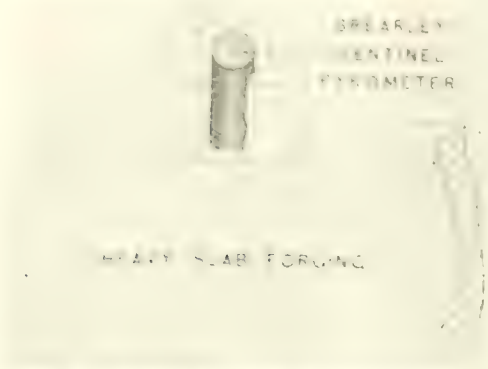
PYROMETER IN CONTACT WITH THE SHAFT END OF A FORGING

*A paper read before the Institution of Mechanical Engineers.

**Sir W. G. Armstrong Whitworth Co., Newcastle-on-Tyne, England.

ter and approaching 100 feet in depth. If further developments are to take place, the quenching of these colossal masses will have to be seriously considered if we are to obtain the best results, and not only compete with, but lead, competitive nations.

Those who have experimented by water-quenching materials in the mass,



SEARLEY SENTINEL PYROMETER APPLIED TO HEAVY SLAB FORGING

know that greatly superior results can be obtained, and also that the structural condition is all that can be desired. The author believes he is correct in stating that this form of quenching, if not in use in this country, is in operation in foreign countries, and of the forgings so treated which have come before him, both for microscopical examination and general testing, to say the least, the results have been highly commendable. He is disposed to think that steel manufacturers would welcome the opportunity of the choice of quenching mediums both from the point of view of producing a better article and also by dispensing with a costly fluid, and one which is attendant with great risks when large masses of steel are being hardened. It is possible that slight modifications in the analysis of forgings so treated may have to be made, and at the same time it must also be remembered that quenching mediums which are highly suited for treating large and heavy forgings are not necessarily the best for light forgings or those of thin section, but such matters as these may be safely left to the discretion of experienced manufacturers.

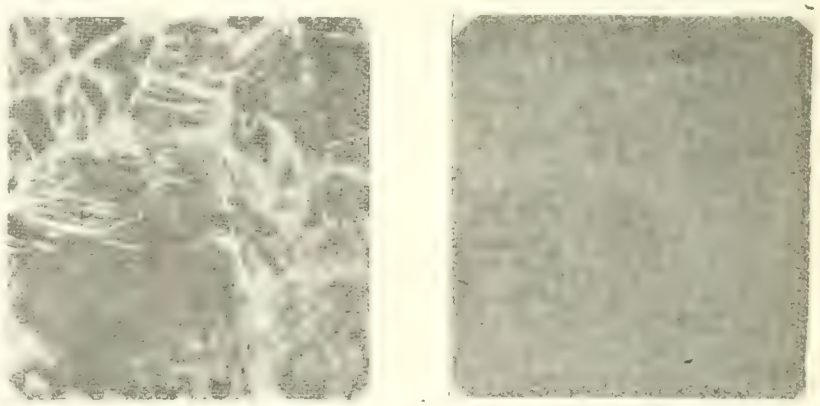
### Specifications

Many specifications covering the composition and treatment of materials leave much to be desired, and suggest anything but progress. They bind the manufacturer in every possible direction, and thus restrict him in the production of an article much superior to that to which he is now limited. An example is cited of specifications covering certain high-class forgings. They are specified to give after heat-treatment, say, 30 to 35 tons tensile with a combined elongation and reduction of area of, say, 80. If a manufacturer produces a better article giving 37 tons together with a sum of 90 representing the combined elongation and reduction, this forging would be rejected, and would have to be re-annealed to conform with the maximum stress. Suffice it to say this forging after the re- treatment, although conforming to specification, would be much inferior than when in its original heat-treated condition.

The author hopes that engineers and the steel manufacturers' customer will correct him if his interpretation of specifications is incorrect. He looks upon specifications as a working basis, drawn up between the engineer and the steel manufacturer when entering into contracts, to be used as a guidance for both parties and with reasonable discretion by the inspecting engineer. If specifications were so framed that they were to be enforced to the letter, one could see little use for the intelligent engineer as an inspector.

### Research

As research investigation should be of great value and assistance to the steel manufacturer in guiding him out of his occasional troubles, it is felt that this paper would be greatly wanting in a most essential detail if reference were not made to this very important subject. In the author's opinion the great value of research work is often lost owing to its want of application. The research chemist may be a highly qualified man, and his conclusions as to the cause of failure within reasonable limits of being correct, but generally speaking, he is not in a position to apply his reasoning into works practice, and his reports being often of a highly technical character are to some extent beyond the technical range of our good practical men. It would therefore appear that a gap yet exists between the works and the laboratory, and requires to be bridged across in such a manner that the full value of research investigation can be infused into works practice.



Practically Heated Before Quenching — Refined and Normally Heated Before Quenching

FIG. 14—80-TON FORGING SHOWING EFFECTS OF QUENCHING AND TEMPERING

It is often stated that the fine structural conditions and excellent tests obtained by treating pieces in the laboratory cannot be obtained when treating masses in the works. This idea is totally wrong; by reasonably careful control of furnace conditions, and where quenching is necessary, regulating these conditions also, equally good results can be obtained. To substantiate this statement, in Fig. 14, is shown the structural condition of a forging weighing about 30 tons, which had been subjected to a prolonged heating before quenching. This was subsequently given a refining treatment, requenched and tempered, with the result shown in the adjoining photograph. This is by no means an exceptional case, and it is questioned if a much finer structure can be produced in the laboratory when dealing with a 1-inch diameter bar.

### Ghosts

Ghosts in steel forgings, as is generally known, are caused by the presence of non-metallic enclosures; and whatever form of heat treatment these forgings may subsequently receive, it is practically impossible to remove these ghost-marked areas. It is, however, within the writer's experience, possible to reduce the size of the ghost-marks, but the treatment necessary is both drastic and costly, and possibly the remedy may prove little better than the evil. This is a subject for which there is yet much room for investigation; and although in some cases their presence need not be looked upon with any degree of alarm, there is no question that a steel free from ghosts is a much superior article. In any case, prevention is always better than cure, and it is quite possible for the steel-maker to cast ingots of 100 tons in weight with the major portion entirely free from ghosts.

It has been endeavored to indicate briefly the principles underlying successful heat treatment on a commercial scale, and although in a small degree the value of science in the works has been discounted, no one is more anxious than the writer to see it take a prominent place. This end, however, can only be attained by creating in those who have the handling of this class of work a personal interest, and this will be best achieved by occasional practical demonstrations.

The great value of correct and careful heat-treatment does not yet appear to be appreciated by many whom it should seriously concern. When it is generally realized that forgings made from the best steel produced can be hopelessly spoiled, due either to insufficient heating or by overheating, and that forgings such as are now under review may be worth many thousands of dollars, and again from this same cause premature fracture may take place with a consequent great loss of life, this subject may be given closer attention and considered more as a crude form of craft.

# Corrosion of Iron and Steel, and Its Prevention-III.*

By Abe Winters

*Perhaps the most pathetic feature of man's existence on this planet is illustrated by the contrast between the immense metallurgical and manufacturing industries based on iron ore, and the loss of finished metal due to corrosion. Sometimes obscure, sometimes prominently noticeable, the ravages of rust are the most relentless of all handicaps which man lives under, undoing with hitherto unpreventable certainty that which he has done.*

AS HAS been shown, the rusting of iron and steel is a definite chemical process due to the combined action of air, moisture, and carbon dioxide upon the metal. The increased rate of chemical corrosive action due to a local increase of temperature is noticeable, and may be due to galvanic action set up between portions of the same metal at different temperatures.

Corrosion, or the oxidation of substances by chemical action is always accompanied by electrical energy, which may be of more or less intensity, or electromotive force according to the substance consumed. Rust proceeds solely from the action of acidulated moisture upon a clean iron surface, and is probably only a point action in the beginning.

The affinity of the iron for the oxygen in the acidulated moisture of the air or water in the oil, or from other sources is greater than its bond with the hydrogen, which is sixteen times the volume of oxygen united with the iron to form hydrated $Fe_2O_3$ or red rust. They hydrogen, from its light specific gravity, in its effort to escape into the air pushes up the overlying coating, increases the area of the affected part, cracks the coating in its exit, moisture enters again, and corrosion is master of that location.

The rust which has thus been formed is hygroscopic and carries twenty-four per cent. of moisture as it forms. This moisture never dries out under any atmospheric heat condition, but is ever ready for a chemical decomposition. The hydrated red rust, being nearly two times the volume of the iron from which it is formed, adds its efforts to the free hydrogen to push through any protective surface film and eventually create havoc over the entire surface. This mechanical action is far more energetic than a mere casual observation would lead one to imagine. In considering the question of rust prevention or prevention of corrosion, it is essential that the nature of the corrosion and the cause of its formation be known.

### Protection

The general subject of protection against rust or the corrosion of iron and steel may now be considered by reference to the four principal methods which may be employed, each method having its respective value and limitations. All have proven practical for particular purposes, although none of them are perfect under all conditions; a very wide field is still open for more extended use of these preventatives.

Group No. 1.—Alloying, or introduction of other metals into the composition of the steel when manufactured.

Group No. 2.—Covering the steel by mechanical means, as by painting, enameling, lacquering or the application of inert metals.

Group No. 3.—Rendering the steel or iron surface passive.

Group No. 4.—Coating with metals electro-positive to iron.

We have already noted that changing the composition of iron influences the resistance to corrosion, wrought iron and steel of various methods of manufacture are greatly influenced in corrodibility by the amount of phosphorus contained in them. With one per cent. of phosphorus present the corrosion is a little over one-half as great as in cases where the iron is free from phosphorus.

If two pieces of steel containing different percentages of phosphorus are immersed in salt water, in contact, the low phosphorus specimen will corrode more rapidly than the high grade metal. Iron alloyed with nickel, cobalt or chromium behaves in a similar manner.

Many different kinds of steel are now being made in which other metals are being added, such as tungsten, copper, vanadium, zirconium, molybdenum, etc. These additional metals not only affect the physical qualities of the steel, but also influence the rate of corrosion to a large extent. It is probable that future development of this method of combating the corrosion difficulty may eventually throw light upon the mysterious iron preservation methods used by the ancients upon various specimens which have been the source of admiration and wonderment on the part of thousands of our leading scientists during recent years.

### Group No. 2

The most common and widely known method of protecting iron or steel from corrosion is by covering the iron or steel surface so as to mechanically protect it. A pigment and a liquid mixed together so as to form a thin coating when spread or sprayed is the method usually employed under this group and requires only brief attention in this article. The essentials of good paint are adherency, non-corrosive properties, hardness and elasticity, proper drying properties, durability and covering power.

Paint destruction may result from the following causes: Mechanical injury, action of gases, chemical action between the pigment and the liquid vehicle, chemical action between the surface covered and the paint, action of light, peeling, cleaning, and from water.

To successfully design a paint which will resist all of the previously named destructive agencies is a difficult matter. The field is an enormous one to cover and but little positive knowledge has yet been obtained, though the investigators and experiments have been legion, and the literature on the subject embraces volumes. Experiments are numerous in the field of designing a waterproof coating to be applied over the pigment which has been found to possess the most preservative qualities, independent of the water-repellant features, but the goal has never been reached.

How effectively a thin coating of the proper material can protect the surface of a paint which it covers can be seen in the lettering of old sign-boards, which is perhaps an example of the most durable paint of which we have any record This protective effect is explained by the well known fact that lamp black is one of the best water-repellants known, that it is practically indestructible by oxidation or acids, and being per se of an oily or greasy nature, when mixed with a pure oil and being in a measure elastic, it has effectually preserved the surfaces and not allowed the water to reach the underlying coats of white lead.

The electro-deposition of inert metals upon iron or steel surfaces as a means of protection from corrosion, as well as coatings obtained by immersing the iron or steel in bath of the molten metal, may or may not be even temporarily effective, the resistance to corrosion depending entirely upon the continuity and mechanical strength of the coating; vitrous enamel is employed effectively as a covering for cast iron water manifolds and is regarded by certain authorities as being superior to any other known process of rust-proofing.

### Group No. 3

Iron under certain special conditions assumes a state in which some of the properties it usually possesses are not apparent. Certain strong oxidizing agents will prevent the solution of iron by an electrolyte.

When bright clean steel is immersed in concentrated fuming nitric acid, it becomes passive and is no longer soluble

*Part 2 appeared April 4

[illegible] able to replace copper from a copper sulphate solution. Authorities differ greatly as to the cause but the condition thus produced is the foundation of one of the present widely exploited methods of rust-proofing iron [illegible].

The Bower-Barff process is an example of the passivity group. The process consists of producing a rustless coating upon cast iron, steel, etc., by exposure to a low red heat in special furnaces or retorts and subjecting the surfaces thus exposed to the action of superheated steam, carbon oxide gas, hydro-carbon and hydrogen gas alternately or in combination according to the different processes.

Other processes by which iron is given a rust-resisting coating are those known as Coslettizing, Parkerizing, etc. These processes depend largely upon the action produced when the iron or steel is immersed in a hot phosphorized solution containing either manganese dioxide or [illegible] oxide.

## DIES FOR DROP FORGINGS

By Mark Meredith.

THE dies and tools used in the production of drop forgings have been compared to the patterns used for castings, but the cost of dies is very much higher than that of patterns and the selection of material for dies for a given purpose or class of forging requires careful consideration in estimating the probable cost of the forgings. Generally speaking, there is little or no reduction in cost of drop forgings compared with hand forgings when less than 100 pieces are required, but above this drop forgings show a saving that increases rapidly with the number required.

Dies are occasionally made for compartively small quantities, but as a rule only when the expense is justified by the greater reliability of drop forgings and the reduction in the cost of machining and finishing, due to the greater accuracy with which such forgings can be made. These advantages are frequently overlooked. The rapidly increasing growth of the industry is one of the most prominent features of modern engineering progress. In some cases, especially in the cycle and automobile trades, drop forgings have completely ousted the malleable castings that were once used extensively, but are now considered unreliable for such work.

For many special purposes the advantages of drop forgings are coincident with the necessity for dealing with higher strains, and at the same time keeping the weight to a minimum. This is particularly noticeable in handling high grade alloy steels, such as nickel, nickel-chrome, vanadium, and chromo-vanadium steels that are capable after suitable heat treatment of standing up to tensible tests as high as 120 tons per sq. in.

The choice of material for dies is largely determined by the nature of the article to be made and the quantity required. Cast iron has been used extensively for plain, heavy forgings, and if a good mixture of iron is used to give a tough and close-grained casting very satisfactorily results may be got on rough work. The great disadvantage of cast iron dies is, of course, their short life owing to breakage. For most heavy forgings that are not intricate in design forged blocks of low-grade Bessemer steel are used, and are much more durable than cast iron. As breakages do occur, it is a much better practice, generally adopted, to use dies of a good open-hearth steel. This, especially if Swedish iron is used in its manufacture, is particularly suitable. Crucible cast steel is more suitable when large quantities of small castings of intricate design are required, especially if great accuracy is specified, and when great care is essential to ensure uniformity in the hardening process.

Where great toughness is necessary to ensure durability and reduce risk of breakage a 3 per cent. nickel steel gives good service, and for special forgings, such as 4 and 6-throw crankshafts, connecting rods, and such like, or when the dies are expensive to make, a durable alloy, such as nickel-chrome steel, is usually employed. It very seldom pays to use a cheap material. The analysis of die steel varies according to quality and purpose. The carbon content depends on whether the dies are to be hardened or not, and to what extent, but for general purposes should be from .55 to .70 per cent. A steel giving the following percentage analysis will be found very suitable for most purposes:—Silicon, 0.45; sulphur, .01; phosphorous, .02; manganese, .60; and carbon, .65. In most shops it is the rule to harden all small dies, but with large dies this is not done except for very special work, such as dies for slender forgings that may be 2 ft. 6 in. or more long, with a sectional area of about .5 sq. in. and weighing only 5 lbs. or so.

Untempered dies harden appreciably in use; in fact, they have to be annealed before they can be recut. In recutting a die that has become worn a cut is first taken off the face on the shaping machine, and then the impression is resunk, as much as possible being done by means of machine tools, such as the lathes, planer, or vertical milling machines. Irregular and minor details are then finished off by hand. The vertical miller is generally recognized as the most useful tool for die-cutting, as it can be used for the same purposes as a planer or shaper for truing the face of a die as well as for milling out the impression. The lathe is a good second, as in addition to surfacing it is particularly suitable for dies required to make gear blanks, collars for shafting, and other circular forms; such dies can be finished entirely in the lathe with the exception of the outlet.

For hardening, the dies are often heated to about 800 degs. C., slowly and uniformly. They are quenched in a tank holding 200 to 300 gallons of water, with a feed pipe arranged to force a stream of water against the face of the die, thus chilling the face quicker than the remainder of the metal, which is required to be tough rather than hard in order to withstand the shocks.

## WAR DEMAND INCREASES VALUE OF CHROMITE

THE mineral chromite is the source of the metal chromium, which, as an alloy in chrome steel and in several chemical compounds, occupies an important place on our battle front on both land and sea. The compounds furnish the strong and durable yet subdued and protective colors that are used to dye the soldiers' khaki clothes and tan the upper leather of his shoes. Chromite readily forms alloys with iron and gives hardness to the steel that is used for armor plate on war vessels and for the armor-piercing projectiles which they hurl at the enemy. It is one of the essential elements in stellite, which is now so largely employed in making high-speed tools for cutting steel in the manufacture of munitions.

Unfortunately for the United States the present domestic output of chromite is scarcely one-fourth of the quantity needed for war and domestic uses, so that the other three-fourths must be imported. According to the United States Geological Survey, most of the imported chromite has come from Rhodesia and New Caledonia, and, notwithstanding the scarcity of ships, much of it still comes from those distant lands. In response to the call for chromite Canada has rendered most efficient help. In 1916 she sent 10,930 long tons and in 1917 she more than doubled her shipments of chromite to the United States.

The domestic production of chromite in 1916 was about 47,000 long tons, and last spring the prediction was made by Government geologists that in 1917 it would reach 48,000 long tons. According to J. S. Diller, of the United States Geological Survey, the latest returns indicate that this prophecy has been fulfilled.

### Beds Far From Transportation Lines

Most of the known bodies of chromite are small, and those that lie far from lines of transportation are not available for exploitation by the ordinary miner because of the difficulty and expense of getting the ore to the market.

Much of the chromite on the Pacific Coast is of low grade, averaging about 40 per cent. of chromic oxide, and on that account is of less value than the imported ore, which generally contains 50 per cent. or more of chromic oxide.

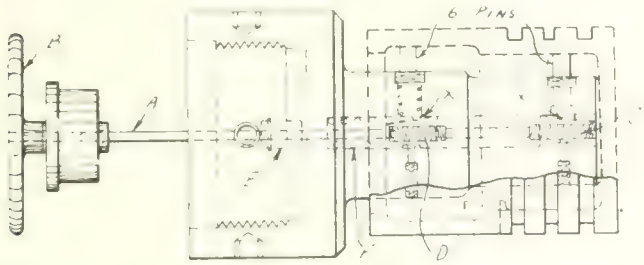
Nicaragua is shipping a small quantity of ore. At Antioquia, Colombia, chromite is reported to be so abundant that it has been used to build the walls of houses. Brazil has valuable deposits several hundred miles north-west of Bahia, and may yet become a contributor to our needed supply.

Most of the chromite is needed in factories in the eastern United States, and on account of the difficulty and expense of long transportation from the western deposits one of the most urgent present needs is to increase the production of chromite in the Atlantic States.

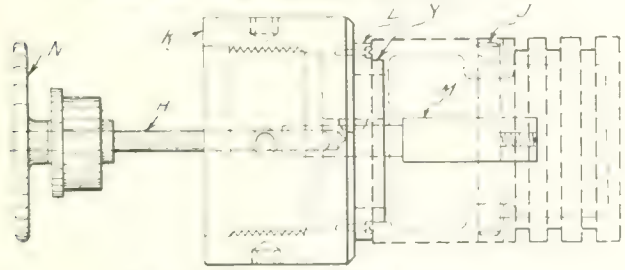
# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data and Ideas Evolved from Actual Practical Application and Experience

In Fig. 43 two methods of gripping a piston while turning the outside, facing the end and grooving are shown. The first of these in the upper view is known as a pin arbor, deriving its name from the fact that six pins are used to grip the work and centralize it by the hole. These pins are set three in a circle and are staggered. The pins are forced out and caused to grip the work by means of a drawback rod A, which is operated by a hand wheel B through the spindle of the machine. On this rod right and left-hand threads are cut at C and D respectively; where these threads come bushings are placed, these bushings have tapers cut in them to receive the pins at X, and by turning the drawback rod the sleeves force the pins out, thereby gripping the work. This rod A is made in two pieces and it is connected by a collar at E, this allows the end of the rod with the threads cut on it to float back and forth, thereby allowing the pins to centralize and grip the work by the inside. The spring F pushes back the sleeve D when the arbor is loosened, while continuing to loosen the arbor causes the sleeve C to be drawn in. As the inside is gripped true by the pins it is apparent that the outside will be turned true with the inside or as near as is possible from a rough casting. In locating the piston on the arbor it is pushed back against the arbor end.



Fixture with Sliding Cams for Expanding Pins



Fixture with Pins at Wide Part Holding Piston

TWO FIXTURES FOR HOLDING PISTONS.

In the lower view of Fig. 43 a method of gripping a piston by means of a taper pin and a drawback rod H are shown. Like the method of gripping shown above this arbor screws on the spindle nose of the machine, the body K being a casting. The first operation on this consists of boring out the end Y and this is then used for centralizing the work by having a steel plate L turned down to fit it. The pin J is placed through the wrist pin hole of the work and into the end of the drawback bar at M. Tightening the hand wheel N causes the piston to be drawn back tight against the steel seat L, thus securely holding it in place while the outside is turned.

### Spindle Nose Fixture

Fig. 44 shows a piece being gripped on a spindle nose fixture, this being securely held in place by a vee block A and screw B. The most interesting part of this fixture is that two eccentric counterbalances C and D are used. These counterbalances are drilled eccentric and are swung around the stud E, and thus they may be set closer or further away from center of the machine as may be required. More exact balance is obtained by their use than with the fixed balance.

An example of holding work on an arbor and driving it by means of a chuck is shown by Fig. 45. In this instance the work is put on the arbor A in the usual manner, the arbor is placed between centers as shown when set in this position, the chuck jaws B are tightened independently on the work, so as to drive the same without depending on the drive of the arbor in the short holes.

Fig. 46 shows chuck jaws for gripping under the rim of a pulley; these jaws are set out to suit the size of the pulley at A and are extended out from the chuck so a facing tool may be run over the top B to true up the rim. Three jaws are usually used, C to C, the jaws are tightened loosely in the pulley, and the pulley is pushed against the pot D. In this position the screw C is tightened, this centralizes the pulley from under the rim and also drives the same while the hole is bored, the outside turned, one end of hub face and the rims of the pulley faced; a bushing E is placed in the chuck in this instance for piloting the boring bars.

In Fig. 47 two more spindle nose fixtures are shown and the upper one might be termed a split chuck, the body of the chuck A screws on the spindle nose and

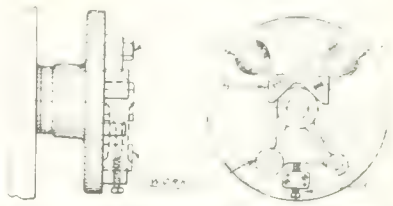


FIG. FIXTURE USING VEE BLOCKS AND COUNTERBALANCES.

has six slots B cut in it. The work is gripped by the chuck in the manner shown and the sleeve C is used to cause the chuck to grip the work by means of the beveled surface X.

In the lower view Fig. 47 a fixture known as the pot type is shown. This fixture D screws on the nose of the spindle; the work is placed inside of the fixture and two rows of screws E and F are used to grip the work. A pilot bushing G is used with this fixture for guiding the boring bars and the work is also pushed back against this bushing. Both of these fixtures Fig. 47 grip the work on the outside while the inside is being finished. The one in the lower view grips on rough diameters, while the one in the upper view grips finished diameters.

Another expanding type of pin fixture is shown by Fig. 48. This is made with a steel ring B on it for supporting one end of the work which has been bored out to size while three pins C grip the other end of the work; these pins are caused to expand and grip the work by the stud D which is operated by means of the nut E. The screw F prevents the stud from turning while the nuts G force the pins down when the stud is released. Steel washers H which are held in place by screws keep the springs in

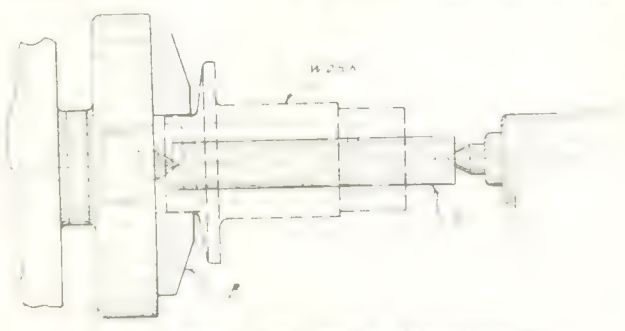

FIG. ARBOR ARRANGEMENT OF WORK HOLDING

position and the body of the fixture A is made of cast iron.

The final illustration, Fig. 49, describes a method sometimes used for turning a part eccentric with a hole which is being bored at the same time. In this illustration the drill A is boring the hole and the work is gripped inside by means of the chuck jaws B. A steel ring C is held on the chuck to conform to the eccentricity of the piece. On the cross-slide tool a roll D is mounted, this roll is held in contact with the ring C by means of a spring or weight on the cross-slide, and as the work revolves the cross-slide travels in and out following the ring. As the turret on the machine advances the bracket E pushes the tool F which is held in the slide G in the direction of the arrow, this causes the same to turn the work, and as the whole cross-slide is going in and out it turns the work eccentric with the hole. The spring H returns the tool-slide G and tool F back to their starting point when the turret returns.

These examples show practical methods of tooling up lathes and chucking machines and are of the type which will be found quite suggestive, of course fixed rules cannot be determined upon for the design of any of these tools as the conditions under which each tool must be handled vary with the work to be done, nevertheless the examples here shown illustrate the advantages to be obtained by the use of good holding and driving methods for lathe work.

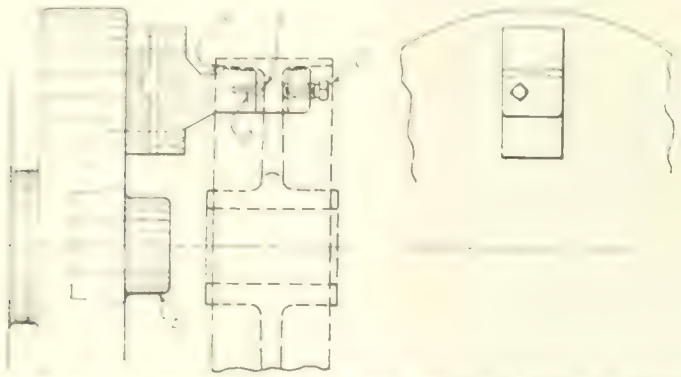

FIG. 48. CHUCK JAWS WHICH GRIP ARMS AND UNDER RIM OF PULLEY

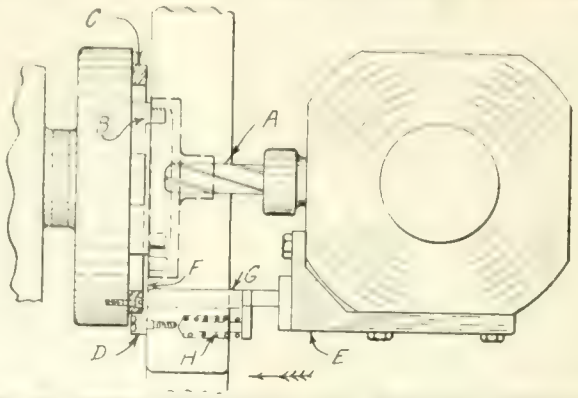

FIG. 49. FIXTURE FOR BORING AND ECCENTRIC TURNING

## HARDENING EXPANDER PARTS

By D. A. Hampson

The rollers and the mandrel of a boiler tube expander get about as rough treatment as any tools used by mechanics. They need just the right heat treatment to neither bend nor break and to have durability. Case-hardened parts are now used to an extent but most of the expanders have been made of tool steel.

Not so very long ago one of the largest manufacturers of expanders was hardening all these parts in a blacksmith's fire—at a heavy loss. The mandrels warped severely and required a lot of expensive straightening. The rolls did not warp so much but they were over-heated and under-heated and the loss on them must have been forty per cent. An expert in hardening in another line was called in and he devised the arrangement shown.

A number of lengths of tubing were made up with slits through the side wall and pins across one end to form a bottom. In these tubes the rollers were to be placed end to end, the relative diameters being such that the rollers could not crowd by one another but must always be standing one on top of the other. The pin through the bottom kept them from falling out. At the top end, the tubes were cut and bent to form a hook for handling.

The idea was to heat in lead. The slots in the tubes and the half open bottom allowed the molten lead to circulate in and about tube and rollers almost as freely as if dropped in the lead pot loosely and when the tubes were lifted the lead ran out as fast as the lifting out. With a quenching bath close to the furnace, arranged with a guide for placing and dumping the tubes quickly, the rollers were hardened but a few seconds after they came out of the lead. And they were all of the same heat and all hardened alike. The first roller out of the lead was the first in the bath. A lead pot, or tank, deep enough to take in the tubes was installed. The supply of tubes was such that as fast as one was ready to empty another was filled and put in.

The tubes were longer than the pile of rollers so the latter could all be submerged and, as steel floats on hot lead, a pull pin was needed to keep the rollers down. The mandrels were hardened in the same way. The initial expense was exceedingly light and the results were highly gratifying, the losses being practically nothing and a man hardening more in a day than formerly in two weeks.

FIG. 47. TWO METHODS OF HOLDING LATHE WORK.

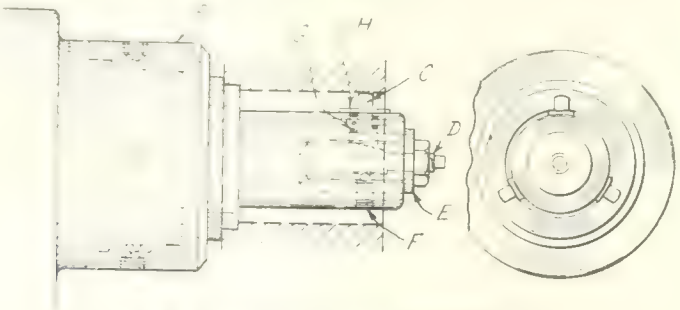

FIG. 48. EXPANDING PIN TYPE FIXTURE

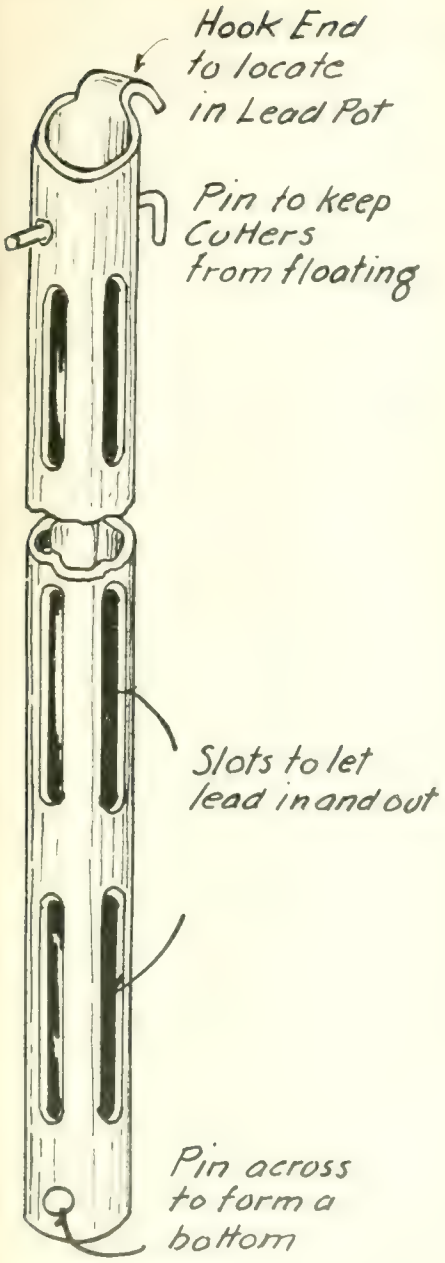
## THE CARE OF SAWS

THERE is a very great deal of bad work by those who use a saw, which no influence of any kind can improve, and a good deal



FIXTURE USED IN THE HARDENING OF EXPANDER ROLLERS.

of this bad work is due to the state of the saws, which will not cut straight unless the teeth are all of one height, and set equally to the right and left. If a board has to be planed after sawing, much more labor has to be expended on it to give it a good surface when badly sawn. In spite of the progress of wood-working machinery, the hand saws will never entirely disappear in remote districts, or in places where they are required occasionally, and the chief consideration is the amount they will cut in square feet without re-sharpening. Much depends on the nature of the wood and the amount of dirt that lies on the surface, which, when carried into the path of the saw, rapidly spoils the cutting action of the teeth. But more depends on the complete regularity of the tooth points both as regards height and projection to right and left after "setting." When half a dozen teeth in various positions on the saw are found to have a rounded point, due to wear, while all the rest of the teeth are quite sharp, it is plain that this half-dozen are projected so much beyond the others as to prevent them from engaging in the work of cutting. The progress of sawing is thus proportionately reduced. A well-filed saw shows equal wear on all the teeth engaged in work, and if the setting is equal it will cut in a straight line with very little guidance. The width of the cut must be nearly twice the thickness of the blade to permit the sawyer to guide it against the influence of knots or change of direction of the wood fibre. Saws of good quality wear out more files than cheap saws, but keep their edge much longer, and being spring tempered they remain perfectly straight. There is no profit in a cheap saw for a man who uses it often. The circular saw, after a long period of popularity, is now giving place to the band saw, which is more easily managed. The circular saw requires very careful management, and if twisted or buckled needs an expert to set it right. Its popularity depended a good deal on the ease with which it could be fitted up on a wooden bench. The frame of the band saw costs much more, but the blades are comparatively cheap, and it will deal with much thicker logs than can be cut by the circular saw. It is estimated that there can be from 50 to 65 thousand feet of average wood cut on one sharpening.

## MACHINING ECCENTRIC PISTON RINGS

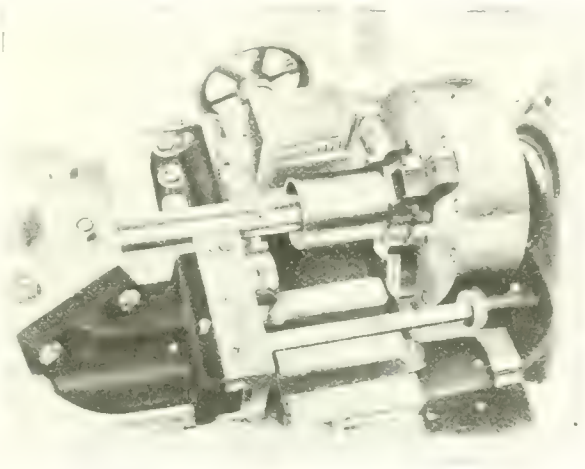
*Herbert's Monthly.*

PISTON rings are articles which are usually manufactured in very large quantities; a common method used for machining the eccentric type of ring is to mount the pot casting on a cross-sliding face plate fixture, which can be set in two positions. The bore is first machined with a single point boring bar, after which the casting is moved over the required distance and the outside turned.

If the quantities turned are large, it is profitable to provide a special attachment which will do the turning and boring simultaneously. An attachment of this kind is shown in the illustration. The pot casting is gripped in a three-jaw universal chuck, to the back of which is bolted a gear wheel, which engages a pinion shaft connected up to a slide bolted on to one of the turret faces. The turret end of the driving shaft carries a cam, which imparts an oscillating movement to the slide which carries the turning cutter.

Boring and turning, therefore, proceed simultaneously, the outside of the ring being turned eccentric, with the bore through the oscillating movement imparted to the turning tool. The front of the cross-slide carries a holder with a series of blade cutting-off tools, each of which projects a little further than the one adjacent to it.

The rings are cut off successively at the same time as the boring and turning operation. Such an attachment is equally as productive as a single purpose piston ring lathe, and has the advantage that it does not prevent the lathe being used for other work.



FIXTURE FOR MACHINING PISTON RINGS.

## STEEL SHIPBUILDING IN AUSTRALIA

P. H. ROSS, Canadian trade commissioner at Melbourne, Australia, reports that considerable progress is being made in the shipbuilding industry in Australia. Recently the expert engaged in England to supervise the Commonwealth Government's shipbuilding scheme arrived in Australia and is now completing his examination of the various federal, state and privately-owned plants and yards.

The Commonwealth Government has extensive yards at Sydney; the State Government of New South Wales has a plant at Newcastle and the State Government of Victoria has extensive yards at Melbourne, all of which (independent of the federal shipping advisor) are managed by competent steel shipbuilders with practical experience in British yards.

It is announced that in February there would be sufficient steel in Australia to build seven steamers. At the outset some imported materials will be used but the bulk of the steel will be supplied by the Broken Hill Company's steel works at Newcastle, N.S.W., which, with subsidiary or associated companies, will ultimately be in a position to furnish all the structural steel for the framing and plates required for the construction of steamers in Australia.

The work will be apportioned to the yards in the several states and, while no authoritative statement has yet been made as to the size and class of the steamers, it is considered by experts having knowledge of the facilities available that the initial vessels will be about 330 feet long by 48 feet beam, with a carrying capacity of about 3,500 tons.

## NATIONAL FAIRS BECOME WORLD-WIDE INSTITUTIONS

THE fourth British Industries Fair which was brought to a close March 22 in London, is a convincing argument for the soundness of judgment shown in continuing the Canadian National Exhibition without interruption during the war.

The true significance of national fairs only began to be recognized soon after the start of the war when the dislocation of trade, due to rupture of commercial relations with Germany, directed attention to the vast amount of business transacted at the Leipsig fair. Traders from all parts of the world, but particularly Europe, flocked to this gathering and it was a valuable rampart in the wall of commercial supremacy which Germany was aiming to girdle around herself.

The French were quick to seize the opportunity created by war conditions, and the Lyons fair immediately became a national institution for French traders. Like the Leipsig fair, it was of an international nature, certain Canadian manufacturers having availed themselves of the opportunity to introduce their product to future customers on each occasion.

The British Industries Fair, to use the official title, varies in certain important features from the other events. It is directly under Government auspices, being promoted by the Board of Trade, and only British manufacturing firms are permitted to exhibit. The movement of which the exhibition is evidence is aimed directly to capture trade formerly in the hands of German and Austrian firms; exhibits therefore, were confined to articles produced in the following trades: earthenware, porcelain and china; glass and glassware; fancy goods; stationery and printing; paper; toys and games.

The possible benefits to be derived from such events can be gathered from the fact that one firm of exhibitors at the British Industries Fair was reported to have opened 500 new accounts, while in three other cases firms which had contemplated closing down were able, as a result of the Exhibition, to book a sufficiency of orders to place their businesses on a substantial footing again. As a matter of fact the initial effort of the Board of Trade to establish an Industries Fair met with so much appreciation from the manufacturers that they petitioned the Board to make it an annual event.

Exponents of Canadian ability have therefore every argument in favor of developing and intensifying the work of the Canadian National Exhibition. The shell business cannot always be with us. By the time next Fair arrives many existing contracts will either have expired or be nearing completion.

Machine tool building, shipbuilding, engineering and allied metal-working businesses can only be properly cultivated and developed in a country whose general activities and demands are varied enough and large enough to induce a sufficient degree of consumption of all products so that maintenance of plant, extensions of factories due to increased international trade or increase of population, and introduction of new processes and designs to suit advances in taste and consumption will all react on each other to maintain a continuous and evenly distributed activity, with its resulting balance of spending power.

Such conditions tend to stabilize the trade of the country in a desirable manner due to their widespread foundations, based on the country as a whole, and it is because of its significance as a national trade barometer that the Canadian National Exhibition should receive greater and still greater consideration from present and potential exhibitors as well as from prospective visitors.

The Exhibition authorities do much work in spreading the reputation of the Fair, manufacturers in all lines have done nobly during the past four years, and the public have always shown their appreciation.

But, let the event assume a solemn importance—consider it to be a vital event, a psychological period during which the world is our critic, to be influenced favorably or otherwise—let it be an occasion on which our visions may receive successive permanent increases, that our actions may be guided by considerations for the future as well as the present.

While we are not handicapped by having to develop a new institution as in the cases cited, our apparent advantage may be nullified by the familiarity of long acquaintance. The novelty may be inclined to wear off, but such thoughts should be completely dispelled when our possibilities as a factor in world commerce are fully realized.

Although any hour now may see the tide of battle turn definitely toward the final goal, the end is not yet. Greater efforts will be needed to withstand the coming months of stress, but just as the race is to the swift, so will future supremacy in any line be to him who is prepared.

Canada has had unequalled opportunities for being prepared. The National Exhibition is an unequalled occasion for convincing herself and the world that she has grasped them.

## DAYLIGHT SAVING AT LAST

BY the time these words reach our readers, daylight saving as a national event will have been in existence several days.

That it will become an annual event is more than likely; the advantages to the great majority greatly outweigh any minor inconveniences which it may cause to the few.

Food distributors and similar people may not care for the lessening of their daylight in the morning, but the many workers in factories have all too little private time for fresh air and sunshine. The necessity for more real living is obvious to welfare students when the long hours and steady grind of munitions shops are taken into account.

Saturday afternoons and Sundays have been reduced to an indistinct memory for far too many workers, young as well as old, and the opportunity of leaving off work when the sun is fairly high in the Heavens should result in benefit to health and spirits of many tired and jaded people.

The most direct benefit expected is from the increased daylight available for gardening, etc. The farmer uses all the daylight there is at present, but the factory worker with a lot to attend to has to quit all too early for the country's good and his own, too.

That many people may be led to take up market gardening or otherwise assist in the country's most indigenous of industries will serve in its way to ameliorate possible distress should industry be at all dislocated during days to come.

# GALT MANUFACTURERS ARE HOPEFUL FOR THE FUTURE

T. H. Watson, President of the Canada Machinery Corporation, Suggests That the Government Should Act With the Manufacturers

Special to CANADIAN MACHINERY

GALT, April 15.—Interviews with leading manufacturers in Galt indicate that they are not given to prophesying, and while they have their hopes and ideas as to what the future may bring, they are disclined to make any positive statements. Some six or eight plants have branched out into the making of munitions since the great need arose for unlimited quantities of weapons of war, some of them manufacturing shell cases, and others smaller parts, such as the brass fittings. Still others have had their normal output increased by the demand for munition making machinery.

### Not a Pessimist Yet

A. R. Goldie of the Goldie & McCulloch Co., Ltd., said it was hard to forecast what the future might hold. He suggested that the best way to prepare for the future was to deal effectively with present problems.

He was hopeful as far as the labor problem was concerned after the munitions business stopped. "When our shell plant was shut down for two or three months," he said, "our men were absorbed by other industries, and I presume the same thing would happen again, provided there is no slump in general business."

He said no particular plans had been made by his company with regard to entering the foreign field, and he was not looking for any expansion along that line.

### War Makes New Connections

"It is no easy matter to anticipate after-the-war conditions," stated Mr. W. D. Sheldon, of Sheldon's Limited, "but we are ready to revert to our regular lines (the manufacture of fans and ventilating machinery) at any time. The war has given us foreign connections which we expect to make future business. Manufacturers generally are trying to be prepared for whatever may come after the war—either the handling of an unusual volume of business, or for a slackening off of production."

Mr. Sheldon pointed out that, at the present time, a large number of women were being employed on the manufacture of munitions, many of whom were soldiers' wives, who would return to their domestic duties when their husbands came back to civil life, and this would help to create normal conditions as far as labor was concerned.

In passing, Mr. Sheldon remarked that he had found female labor satisfactory, the women having shown an adaptability and capability that was surprising.

### Government Should Assist

T. H. Watson, president of the Canada Machinery Corporation, had a suggestion with regard to the exploitation of the foreign field by Canadian manufacturers. He said that he had as yet taken no steps along that line, and he believed that, generally speaking, individual effort for such expansion would be a failure. He thought that for the manufacturers of this country to become established in foreign markets it would be necessary for the Government to create a bureau whose duty it would be to enquire into the needs of other countries, secure orders, and place them with the firms able to turn out the work. The expense to individual firms in trying to build up an export trade kept them from seeking expansion in that direction.

Mr. Watson added that women constituted the surplus labor on war material, and it was safe to assume that male munition workers would readily find employment in other lines.

# DAYLIGHT SAVING WILL NOT MAKE GREAT DIFFERENCE

Manager Also Believes That Time Is Coming When Molding Will Be Done Largely By Foreigners

WHILE piece work enters so largely into the industrial plan, the changes to be brought about by daylight saving will not make a great deal of difference to the manufacture.

This is the opinion at least of Mr. S. Stone, manager of Fittings, Limited, Oshawa. This concern is employed very largely on munitions, and no discouragement is placed in a man's way if he desires to add an hour or two to his day's work. The daylight plan will probably result in a greater degree of evening work being placed on garden plots—inducing many people to go in for this kind of work on a larger scale than might otherwise be the case.

With regard to the help problem, Mr. Stone states that the men who have found work in munition plants for the time being do not in the great majority of cases look forward to employment in the iron and steel business as a permanent thing. When the readjustment is in sight, and it is no longer possible to make a minimum wage of say, $4 a day, these men will, in all likelihood, drift back to their former fields of work.

"We have found that it pays to train men, from the ground up, in the class of work that we require," said Mr. Stone. "Such men will, we feel, be with us permanently. We try to instill into them the idea that a man's future is just what he, himself, makes of it, and that opportunities are as promising in this field as in any other. The fact must be impressed upon workmen that there is a time coming when keen competition is going to weed out the culls and that the demand is going to be for the specialist—no matter what the field of effort may be.

"By placing these so-called temporary men on jobs to which they seem adapted, we have made some remarkable discoveries. ome of them have developed so rapidly that in a short time they have proved as efficient as those who had a much longer training. We have tried to keep these men with us, and in some cases have succeeded—but it is difficult to retain men who come from the farms. When spring comes they hear the call and are off. One of these was a man whom we had placed in an over-position, but when spring came money was no object to him—and of course we do not wish to be too persuasive with men who go in for agriculture. Shortages caused by this drain are always filled from other sources."

One of the greatest problems is in connection with the foundry. Although good money is paid, the number of Canadians employed in the molding trade is becoming less and less, and the outlook is that it will become one of those lines of work in which foreigners are largely employed."

WHAT is value? The law student used to learn that it is the price arrived at between the least urgent buyer and the least urgent seller. Very good. An Ontario tool dealer quoted a price by mail on a certain machine. The prospective customer laughed at the figure, saying it was too low for the machine to be any use. He came to town a few days later and bought the same machine, unknowingly, after personal inspection, at a price almost seven hundred dollars up. What is your definition of value in that case?

# Pig Iron Continues Very Scarce and There Is a Run on Scrap Metal Now as Result

## Orders Given to U.S. Board to Increase Production on War Orders—Shell Steel Coming to Canada to be Turned Into Big Size Shells—Machine Tools and Supplies in Good Demand.

IT is very easy to read between the lines that the United States realizes the need for speed in connection with her war program. Pershing calls for motors, large shipments of shell steel are booked for forging and machining in Canadian plants for United States war orders, and a free hand is given to the War Industries Board to commandeer anything they need to run their war operations at full blast. Toronto and Montreal firms have orders for twelve-inch American shells, and plants are being made ready for the work. The production of pig iron continues to show larger figures at the American furnaces, but this situation does not find its expected improvement in the supply that is reaching Canada. Consequently there is a greater run on scrap metals, the prices of which in several cases have advanced quite sharply during the week. Dealers complained a few weeks ago that the embargo that was placed by the Dominion Government against the export of scrap would result in stagnation. It has not done this, and stocks in Canadian yards are well cleared out. The shortage in scrap is also quite acute in United States, the great demand for it from the war shops and foundries being given as the result.

United States officials speak of the danger of a steel shortage, and are warning against allowing it to come to pass. This may mean a further reduction in the list of those who can secure steel, confining the output more and more to strictly war purposes. The production of air-craft in the United States is not as satisfactory as was hoped for.

Canadian dealers in machine tools and supplies report business as being brisk. The munitions plants are still operating long hours, and this means a steady run on high speed steel in all shapes, and certain lines used in these operations are scarce as a result.

## ORDERS FOR BIG SHELLS HAVE BEEN PLACED IN MONTREAL

Special to CANADIAN MACHINERY.

MONTREAL, Que., April 16, 1918.—Within a very short time we may see enforced throughout the United States regulations affecting the allotment of raw materials to all industries now engaged in essential undertakings for the Government, with the purpose of maintaining undisturbed production. Heavy ordnance manufacture on an extensive scale is one of the recent developments in the States. Munitions actively has been revived in Canada by the placing of large orders for the heavier American shells with the possibility that more will follow; these recent contracts call for the production of 9 and 12-inch shells. A factor that is causing some uneasiness throughout industrial circles is the uncertainty of labor during the coming weeks and the possibility of strikes on or about the 1st of May. Some action has been taken by the American Government to guard against this eventuality, but time alone will tell how successful such steps will be. Another feature in connection with the labor situation is the acquisition of help for food production, to secure which it may be necessary to restrict non-essential manufacture to permit additional help to go on the land. Apart from this, however, the industrial situation is one of pronounced activity and prospects are encouraging.

### Steel

General conditions throughout the steel trade have shown little improvement during the past week and the demand for steel of every description is as heavy as ever; so much so that the American Government are contemplating taking steps to regulate the distribution of raw materials in addition to controlling the prices at which they may be sold. The week's announcement that the United States propose the construction of extensive ordnance works indicates that their requirements will be increased, entailing greater restrictions on the ordinary demands. Efforts are being made to stimulate the steel output to meet the immediate needs. The better car supply and improved transportation facilities have been factors in maintaining more regular production, and as a result mills are operating closer to capacity. Many furnaces have been favored with a plentiful supply of coke, due to the better car service. This, however, does not prove that cars are more numerous, as certain activities, such as coal distribution, are inadequate to present requirements; not that immediate needs are suffering, but the pressure on the railroads continues to be of such abnormal character that little headway has yet been made in accumulating fuel for future requirements. This condition, however, will be gradually regulated during the coming months, when navigation will assist in relieving the pressure hitherto pronounced. Many steel producers are suffering from lack of scrap; the accumulation of scrap under normal working conditions being greater than at present. Scrap supply from domestic enterprise is practically nil. While Government regulations are partly responsible for these conditions, the actual shortage might rather be recognized as a factor of abnormal activity in shell steel production, a condition that nets little scrap in proportion to the finished output. Fewer complaints from consumers would apparently indicate that deliveries are more regular. Recent shipments from the mills have been in excess of production, and as a consequence stocks have been somewhat depleted. In sympathy with the plate producers the dealers here are quoting lower prices, but the possibilities of obtaining material are, if anything, more difficult than ever. The changes effective on local plates are approximately 10 per cent. below those previously quoted; $9 for plates, ¼ to ½-inch; $9.65 for heads, and $9.50 for 3/16-inch tank plates.

### Metals

The general market has developed a weaker tendency, partly owing to the better supply and partly due to the slight falling off in the demand. The relief given to transportation has enabled better delivery to consumers, but little additional buying has been reported. Copper is very steady, but some agitation is being made for higher prices. Tin is very unsettled, and the trade is showing considerable nervousness. Spelter and lead are both weak and quiet. Antimony is unchanged, and aluminum has declined on a weak market.

**Copper.**—The market in general is steady in character and the present price as fixed by the Government is apparently operating satisfactorily. Effors are being made, however, to have the price revised to a higher level. It is the impression among many that the present price is too low for the profitable operation of many of the small refineries, and in view of this it is not unlikely that some concession may be made to the smaller producers to encourage them to greater

production and also to enable them to dispose of their metal in competition with the larger interests that are at present well satisfied under the existing regulations. Dealers here report a steady business at the unchanged price of 29c and 30c per lb.

**Tin.**—The claim that little spot tin is available on the New York market has added to the strength of the situation, if such a condition is possible. Consumers are apparently willing to pay any figure for immediate delivery, but exorbitant bids fail to bring out any metal. Greater restriction on export from Britain has stabilized the London market, but added to the acuteness of the American situation. Local dealers intimate that the market here is a little easier, and this week's prices represent a decline over last week of 2c per lb. The reason for this is said to be the possibility of obtaining permits to ship metal now held in England. The market, however, is far from a weak one, and dealers are inclined to believe that the present strength will continue.

**Spelter.**—The market is not active, but sales have been reported. The situation is more cheerful and the trade anticipates a revival from the recent dullness. Plentiful supplies are, however, available for immediate and early future requirements, and unless a sudden demand should develop it is not thought that a stronger market will result. The American situation is relatively unchanged, but quotations are slightly lower. The local market has declined ½c on a quiet demand, the current quotation being 10c per lb.

**Lead.**—The quiet condition that continues on the market has had the tendency to develop further weakness, as buying is very light. Better delivery has added to the available supply, but otherwise the situation is featureless. The New York market [illegible] to ¼c lower, and a listless local market has had the effect of weakening prices, the quotation of 9½c representing a decline of ½c per lb.

**Antimony.**—The situation is quiet and unchanged, and quotations are the same as last week—17½c per lb.

**Aluminum.**—Better supply and weaker demand has resulted in a decline of prices both here and in the States. Dealers here are asking 50c per lb., this being 5c lower than that quoted last week.

### Machine Tools and Supplies

Improved conditions mark the week's activities in the machine tool industry; this has not only been the result of better deliveries, but the general inquiries appear to indicate renewed interest in manufacturing centres. A revival of activity has developed in the trade following the announcement that several large orders have been placed for heavy shells for the American Government. This includes contracts for the 9-inch and also the 12-inch shells. One firm in the Maritime Provinces is rapidly tooling up for the 9-inch size and another here in Montreal expects soon to start operations on the same size shell. One company has recently received a contract for a shell order amounting to about $3,000,000, and in order to manufacture these shells it is learned that an addition will be required to the present plant entailing an outlay of approximately $600,000; it is intimated that this firm has secured the contract for the 12-inch shells. Much equipment will be required for this purpose, and the machine tool trade are deeply interested in the early developments. General machine business has been steady, but not very active. Heavy demand continues for all classes of supplies, particularly for munitions and marine work. One difficulty that is still pronounced is that of the delivery of material and supplies from the States; one dealer here reported that he has been waiting receipt of a shipment of pneumatic tools from the factory in the States that left there about the middle of January. Labor conditions and the scarcity of raw materials is a factor in the maintenance of high prices.

### Scrap

Nothing of special interest has developed in the old material market, and the situation is much the same as last week. Dealers report a condition that permits of little comment, and consumers are apparently only buying to cover their immediate requirements. It is difficult to define the early future of the market and dealers are unable to state clearly the possibilities of the coming weeks. In the absence of anything to base their transactions on the trade here are continuing to quote the prices that have prevailed for the past few weeks.

## POINTS IN WEEK'S MARKETING NOTES

**Orders for 12-inch shells are being placed in Canada, Toronto and Montreal firms handling the business at present. United States mills will supply the material, the forging and machining being done in Canada.**

**Scrap iron prices advanced quite sharply in some lines to-day, boiler plate, machine cast iron and iron car wheels being the lines most affected.**

**The scarcity of pig iron in Canada is causing a greater demand for scrap material, and stocks in Canadian yards are at a rather low level.**

**Cotton rope, from ¼-inch up, shows a price of 62¼ cents now. The substituting of cotton for so many other lines makes the increase.**

**Cylinder oil and lard oil show slight advances.**

**Black sheets, No. 28, are down $5 per ton.**

**Lake shipping is being requested on many orders placed with Toronto jobbers now.**

**A mark of 3,000,000 tons a month is now considered possible by United States steel mills.**

**Steps are being taken to force U. S. ship-builders to specify exactly what they require in orders at the mills, and not go over the mark to secure material for other purposes.**

**Pittsburgh reports that foundry coke is still very difficult to obtain.**

**Unlimited power has been given to U. S. War Industries Board for commandeering industry for war purposes.**

**Great care is being taken to avoid a further steel shortage.**

**A "disappointment" is the term used to describe the results secured in the production of U. S. aircraft this week.**

**There is delay in placing orders for heavy artillery by U. S., although negotiations have been under way for some weeks.**

**General Pershing has sent request which resulted in orders to double the output of Liberty motors.**

## LAKE SHIPPING IS SPECIFIED NOW

**And This Helps to Get Quicker Service —Scrap Metals Are on Upward Grade Now**

TORONTO, April 16.—The scarcity of pig iron in Canada has not been relieved, nor is there anything in sight that would lead to the belief that better things are likely to come to pass in the immediate future. The trade is turning to scrap [illegible] is a brisk trade in this line of metals, and a few quotations are showing a higher price level in consequence.

Lake shipping is coming to the relief [illegible] few of the orders that are on the books of local jobbers contain the request to ship by boat. Several consignments to [illegible] sent out in this way.

No. 28 black sheets show a drop of 25 cents in Toronto prices this morning. That is about the only price change. The dollar-off plate prices announced last week are still holding, and further change does not seem likely just now.

The continuance of the shell business [illegible] machines in certain lines. Orders for the 12-inch variety are being placed for the American Government, and this will necessitate the bringing in of a large amount of shell steel to be converted into this large measure munition.

### Iron and Steel

Cars are arriving in Toronto yards within a very reasonable time of their departure from the mills now and jobbers are thus able to keep in much closer

touch with their trade, although it is still limited closely to the requirements of war orders. The only important price change this week was in light sheets. No. 28 gauge were quoted 25 cents a hundred down on the Toronto list. That amount is not a very great move in these days of high levels, but it is interesting to recall by way of comparison that in normal times that same change, which would amount to $5 per ton, would be considered a move of rather considerable importance. Dealers having orders for lake ports points are being requested now to ship via boat in many instances, the season being well open for points close to Toronto. The supply of available pig iron does not improve, and many shops are resorting to a greater use of scrap than formerly. Figures from the pig iron districts continue to show an increased production by actual performance, and the same figures find no reflection in an improved position in the Canadian market. One explanation, and it sounds plausible enough, is that much of the product now being turned out passes into contracts that have been on the books for some weeks and months, and in this way does not relieve the pressure that is piling up by reason of new and urgent business.

### Scrap Metals

Advances, rather sharp, were noticed in several of the scrap metal lines on the market this morning. Boiler plate takes a $2 increase, this being explained by the fact that there is a scarcity of heavy melting steel, and greater quantities of the boiler plate are being used. Car wheel scrap went up $5, being now quoted at $30 against a former price of $25. No. 1 machine cast iron has also taken a similar advance, the price paid to-day being $30 against the $25 quotation of last week. In spite of the embargo placed against the shipment of scrap metals from Canada, the stock in this country is lower than it has been for some weeks past, and yards generally are getting to a low mark in the amount of available stock on hand. The steel mills and foundries are working to full capacity, and are using a large amount of material. In fact it looks as though they were using much greater proportions of scrap than usual because of the increasing difficulty in securing enough pig iron. Some dealers assert that shops are using as high as sixty per cent. scrap against 20 and 25 in normal times. It was expected with the putting on of the embargo the stocks in Canadian yards would increase, but there are other forces working against this. While a large amount of cuttings come from munitions plants, it must be remembered that many of these places were formerly engaged in lines of work where a similar amount of scrap was made, so that in this way there is nothing additional coming on the market from these places. Dealers are keen to buy right now and the higher level of prices shows that they are out after business, which is a decided change from the past few weeks, when they have been rather indifferent and holding values on a lower level. Scrap metal business is brisk and things are moving out in quick order.

### Rope Is High

Packings, waste and wipers show no change. There is a good demand for these lines, and not much difficulty in securing supplies needed. Cotton rope, quarter-inch and up, has reached the high price of 64½c. Dealers say that the scarcity causes it. There is a greater demand than ever for cotton products, due to the shortage of linen and the bringing in of cotton as a substitute.

Cylinder oil shows an advance for both Capital and Acme, while the same is true of lard oil. No quotation is made for castor oil, although a small amount of the poorer grades is advertised.

### Non-Ferrous Metals

COPPER.—The effort, backed by strong interests in United States, that is now being made to bring up copper prices is being watched by the Canadian trade, although it must be admitted that the local dealers are inclined to think that the present government price will stand. The period for which it runs expires on the first of June. The Toronto price remains.

TIN.—The tin situation does not improve. Any favorable feature that may be noticed in regard to it is so small when compared to the whole situation that it loses size and weight. In fact it is almost useless to try and keep up with the various price changes. Many of the price changes are simply the results of efforts to buy, and have no bearing on the market situation.

LEAD.—Nine dollars is still the local price, and business is fair, held in largely by supplies. More lead has been sent to England lately from United States points, and a corresponding decrease has been noticed in the amount sent to Canada.

ALUMINUM.—American metal papers are publishing rather pertinent warnings, in connection with their remarks about the aluminum situation, drawing attention to the fact that it is against the law of the land to sell aluminum at a figure above the Government fixed price. Sellers are liable to a stiff fine and the loss of their license. No doubt the prevailing high prices are a temptation to jump the restrictions adopted by the Government as to price.

## WINDSOR FIRM CONTENDS THAT TRADE CONDITIONS ARE UNFAIR

Canadian manufacturers of ship fittings in certain lines find that they are in a peculiar position just now by reason of the tariff and other war-time conditions. A representative of the Penberthy Injector Co., of Windsor, Ont., speaking to CANADIAN MACHINERY of this matter a few days ago, said:

"For some time past it has been possible for shipbuilding and munition manufacturers to import supplies from United States free of duty, simply because same was to be used on Government work. There have been large quantities of this material used in Canada during the past two years, and Canadian manufacturers, such as ourselves, are helpless to secure any of the business because we have to pay a duty on all raw material used in our products. We have been advised by the War Trade Board that it is possible to get a refund of 99 per cent. of the duty paid on this raw material, but the only parties able to collect this refund are the shipbuilders, as, according to the regulations same is not payable to the manufacturers. As far as this is concerned, it is out of the question for us to make arrangements with the shipbuilders to secure this refund for us, as they will not go to the trouble, and the result is that practically all of this business goes to United States manufacturers, whereas we consider that Canadian manufacturers are entitled to the same.

"We might also say that even though we were able to secure a refund of the duty paid on such raw materials as are used in our products, we would not be able to compete on an equal basis with American manufacturers, as manufacturing costs are higher in Canada than in the United States on account of the demand for manufactured articles being much smaller, and also for several other reasons.

"We have explained this injustice to the War Trade Board at Ottawa, but are unable to get any satisfaction from them.

"The same situation, as explained above also applies to Canadian jobbing houses. For example, in the city of Vancouver we understand that several United States jobbing houses have agents situated in this city, taking business from under the nose of Canadian jobbers, simply because their goods are allowed into the country free of duty, while the Canadian jobbers have the goods on their shelves, but cannot compete with their prices. This, of course, affects us indirectly, as the majority of our goods are sold through the jobbing trade."

## VERY WIDE POWERS TO AMERICAN BOARD

### Warn Against Allowing a Shortage of Steel to Become a Reality

Special to CANADIAN MACHINERY.

WASHINGTON, April 16.—The United States to-day is better prepared to wage an industrial war than at any time since the declaration of a state of war against the Imperial German Empire. Steps taken during the past week have added materially to the war force of the nation. Perhaps the most important step is that taken by the President in connection with the appointment of Bernard Baruch as head of the War Industries Board. Although Baruch's appointment was announced some time ago, it was not

until this week that announcement was made of his powers.

The War Industries Board, under Baruch, is now carrying on the work which is done by the Director of Munitions in England. The board has been given wide powers over all industries. The power of the President to commandeer any business for war purposes has been turned over to the War Industries Board, and with this power as an instrument work has been started to bring every essential industry in the United States under the control of the War Industries Board.

### The Tonnage Available

Another step which has been taken to co-ordinate the industries of the nation is the taking over of all steamships in coastwise and river traffic. This action is for the especial interests of transportation in United States and is aimed to relieve all congestion on railroads and to divert to water transportation that part of the war traffic which can be so diverted. It will also mean that a portion of the coastwise shipping may be diverted to trans-ocean traffic. Every effort is being made to put forth the maximum American tonnage for transportation of troops and supplies to Europe and where possible coastwise vessels will be used for this purpose. One example of the effort that is being made to utilize every inch of cargo space is an order which has been issued against the transportation of fruits by water transportation. The Cuban shipping has been practically set aside for the sugar trade. This commodity is considered a necessity and only sufficient tonnage is being allotted to Cuba and the West Indies to transport the necessary sugar for the United States and the Allies.

### A Striking Change

The following statement by J. Leonard Replogle, director of steel supplies for the War Industries Board, gives some insight into the steel situation in the United States. "At the time of the Garfield workless day order, January 17, 1918, the production of the principal steel products was as follows: Merchant bars dropped from 137,000 tons a week down to 55,000. Plates for ship construction dropped from 90,000 tons down to 45,000 tons, or just fifty per cent. Projectile steel, which is a very important factor, dropped from 67,000 tons to 37,000 tons. After the mills began to get fuel the production steadily increased and our production of plates now, on our telegraphic reports last week, was 106,000 tons, or just 12,000 a week more than the country has ever produced in any week in its history.

### Pig Iron Short

"At blast furnaces, pig iron is being produced at the rate of about 27,000,000 tons, as compared to an annual capacity of about 45,000,000 tons; in other words, it is a little more than sixty per cent. approximately. We are going to get into a very serious situation in regard to other things. The necessities of our allies are very great. General Pershing has secured some 750,000 tons of steel from the French and the British Governments to meet his urgent necessities, and has agreed to replace it with an equivalent tonnage of steel in this country, in various forms. We are producing projectile steel, largely in rail mills, because before the war there was no capacity for this kind of steel. We are rolling those projectile shapes in rail mills and now the necessities of the railroads are such that they will have to be given every consideration; otherwise our transportation situation will break down." This statement coming from Replogle indicates that the steel situation in the United States is not at all glowing and that great care must be exercised in order that there be no steel shortage.

### Wages Fixed

Wages have been standardized at the shipyards on the Atlantic coast by a labor board working under the direction of the United States Shipping Board. The following wages per hour give an idea of the cost of labor: Hammer and machine forgers, $1.35; anglesmiths and blacksmiths, 87½c; furnacemen, 85c; rivet testers, 80c; lever men or cranemen, 70c; acetylene welders, 60c; marine erectors, 65c; drillers, 60c; stage builders, 57½c.

Labor conditions in the United States are again somewhat unsettled. Action taken by the Senate which threatens a law to prevent strikes during the period of the war has aroused labor to a state of unrest. President Wilson has announced that he will appoint a National War Labor Council which will undertake to adjust all questions of labor and will be a court of appeal for labor. It is hoped that this body will be able to control labor and prevent any action which might embarrass the nation's war program.

The production of bituminous coal was decreased during the week ending March 30, by 27,000 tons, according to reports just issued. The Fuel Administration is urging great conservation and early purchases for next winter's use.

The United States Shipping Board has asked for an appropriation of $50,000,000 for use in carrying out a program for the construction of concrete ships.

A report issued by the Senate Military Affairs Committee this week shows "a disappointment" in the aircraft program and demands greater centralization of control.

## PERISHING ASKS FOR SPEEDING UP

### So Order Has Gone Out to Double the Output of Liberty Motors

Special to CANADIAN MACHINERY.

NEW YORK, April 16.—Shipbuilders have come into the market for shop and yard equipment in greater volume during the last week, being stimulated into action by orders from Washington to speed the construction of boats and to carry out immediately previous contracts to build additional yards. Among the larger companies that have bought machinery is the Chickasaw Shipbuilding Co., located at Mobile, Ala., the southern subsidiary of the U. S. Steel Corporation, which has purchased fabricating machinery, including punches. The Foundation Co., which is building new yards on the Atlantic, will be soon in the market for equipment and has already purchased machinery for one of its Pacific coast yards. The Southern Shipbuilding Co. is speeding work for its boat yard at Brunswick, Ga., and the Virginia Shipbuilding Co. has made additional purchases of tools and conveying machinery. The Merrill-Stevens Shipbuilding Corporation of Jacksonville, Fla., is also placing supplementary orders for tools.

In the North, the Sun Shipbuilding Co., the Chester Shipbuilding Co., and the Groton Iron Works have all been conspicuously in the machinery markets. The Connecticut plant has purchased cranes, the Sun Co. has purchased radial drills. Other plants in New England are preparing additional specifications.

### New Gun Plants

Some disappointment is felt because of the slow movement of the Ordnance Bureau of the War Department in placing contracts for heavy artillery that have

## A LARGE NUMBER OF SINGLE MEN UNDER 34 HAVE NOT JOINED ARMY

Special to CANADIAN MACHINERY.

OTTAWA, April 16.—The operation of the Military Service Act is of no small importance to the industrial world. Figures show that the great bulk of the Canadian army has been drawn from the cities and towns, and the next move in connection with the M. S. A. is awaited with interest. The matter is giving the members of the Cabinet no end of trouble and they are not exactly sure what is going to happen, although they know that up to date the act has not produced anything like the number of men it was counted on to secure.

Your correspondent learns from a source of information that cannot be doubted that there is a feeling that the single men of the Dominion will have to furnish a good many more thousands before the married men will be called to the colors. An official said, "I am inclined to think that there are a good many single men under 34 years of age who have yet to report, and I would like very much to see some radical step which would procure a large number of these single men in the early future."

Some announcement will undoubtedly be made soon. It may extend the age limit of the single men, taking in those up to 40 at first before calling on the married men classes.

Government program, however, is now ... will result in the placing of contracts for new gun plants. Much interest is manifested in the report from Philadelphia that the Government has commandeered large gun boring lathes for installation at the Ambridge plant of the American Bridge Co., ... of the U. S. Steel Corporation. Local officials of the Bridge Co. profess ignorance of such Government action. A great machine shop at Ambridge has been remodelled and renewed with the latest modern tools, and this process has been going on for the last eighteen months, the long time in preparation being due to the difficulty in securing shipments of machinery from manufacturers. The Bridge Co. has manufactured some tools for its own shops and also for sister subsidiary companies, and it is not improbable that gun lathes will be made at Ambridge for shipment to Gary, Ind., where a large gun forging plant is being constructed at the request of the Government.

The Watervliet Arsenal has come into the market for additional machinery and private manufacturers of ordnance are making tentative inquiries for shop equipment. The Ingersoll-Rand Co., which expects to make recoil mechanisms for 75-mm field guns, is preparing to purchase milling and screw machines and boring lathes. Projectile manufacturers have received orders from Washington to double their output of shells and several of them are preparing to increase shop equipment. The American Can Co. is asking for a large number of machine tools and the Spicer Manufacturing Corporation, South Plainfield, N.J., is taking bids on a list of milling machines, grinders, lathes and die-sinking machines.

In response to a request from General Pershing, the output of Liberty motors and trucks is being increased. To assist such manufacturers the Government has commandeered tools which will permit the doubling of such production of trucks and of automobile parts.

Shipments of tools from New England factories are large notwithstanding the railroad embargoes, but some Western machinery builders in order to get tools into New York territory have been forced to make shipments to Boston and transshipment thence to New York.

The demand for cranes has fallen off somewhat recently and builders have been tempted to shade prices slightly. Shipbuilders, however, are still buying cranes of various types.

---

IT is possible with boilers as at present constructed to reach efficiencies as high as 80 to 85 per cent., and if cost were not a consideration as high as 90 per cent.. This is remarkably good when it is realized that the most efficient turbine yet built utilizes only about 75 per cent. of the available energy delivered to it.

# GREATER OUTPUT AT THE U.S. PLANTS

## An Allotment of Shell Steel for Canada to Fill Orders for Big U. S. Shells

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., April 16.—The American Iron and Steel Institute reports that 29 steel companies, which in 1916 made 88.14 per cent. of the total output of steel ingots, produced 3,110,381 tons in March, against 2,273,741 tons in February and 2,203,845 tons in January. Allowing for production by companies not reporting, and taking account of the number of working days, it appears that during March the industry was producing steel ingots at the rate of about 42,000,000 tons a year, against rates of about 33,500,000 tons in February and 28,500,000 tons in January. The March rate corresponds with the average rate of 1917. Production in March was nevertheless at less than 90 per cent. of capacity, which is at least 47,000,000 tons, some estimates placing the capacity as high as 50,000,000 tons.

Production of finished rolled steel is about 75 per cent. of the ingot production, the difference being scrap produced in rolling, which goes into the open-hearth furnace and is weighed again as ingots, and mill scale, which is charged to the blast furnace and comes out as pig iron.

Thus the output of finished rolled steel in March was about 2,600,000 gross tons. The shipments were materially larger, probably between 2,700,000 and 2,800,000 tons, as on account of better car supplies the mills were able to move a considerable part of the steel accumulated in yards and warehouses during January and February. If the mills operated at capacity, and it is a distinct possibility that eventually they will be able to do so, they would produce about 3,000,000 tons a month.

### War and Commercial Requirements

The importance of these figures lies in the comparisons they make with war requirements, as stated in some cases specifically and in other cases only very loosely. As to shell steel, the minimum estimate for the second half of the year has been 2,500,000 tons for the United States and 500,000 tons for its Allies, the maximum estimates running a million tons more. The estimate for the United States includes, of course, the steel that will be produced here and shipped to Canadian shell factories to fill orders of the United States. Thus there is in prospect about 300,000 tons of shell steel a month. When the shipbuilding program reaches the stage of producing 500,000 tons deadweight a month, the March launchings having been somewhat less than half of this, about 250,000 tons of steel will be involved. If steel deliveries for the 100,000 freight cars it is now contemplated to let are delivered over a period of five or six months, it will represent 200,000 tons a month, this including plates, bars, rivets, axles and everything in the steel line involved.

The three items mentioned will probably involve 750,000 gross tons of rolled steel a month. There are many other items, but all will involve individually relatively small tonnages, and the total, whatever it may be, is to be viewed in the light of the fact that production in March was about 2,600,000 tons, while capacity is about 3,000,000 tons. It seems quite obvious that there will be a large tonnage of steel left for ordinary consumptive requirements, after all war requirements, direct and indirect, have been met. Nevertheless statements continue to be made that the war will absorb practically all the steel. Washington dispatches would indicate that this is the view of Government officials, but perhaps it is a case not of its being their opinion but of its being their policy thus to regard the matter, in the interest of safety, for it is much better to assume that the war will take all the steel, and then if there really is a surplus, let somebody have it. The effect upon the market, however, is to make consumers indisposed to formulate plans for the consumption of steel.

### Plates and Shipbuilding

The reason that some of the shipyards have found themselves not fully supplied with plates, considering the tonnage that has been produced, is that some of the shipyards have not in the past made their requirements fully known, and plates have been improperly distributed. The War Industries Board understands this fully and has been taking steps to force the shipyards to specify precisely what they need, and not to overspecify. Some of the plate mills long ago recognized that the system of distribution of specifications was faulty, and that they were being left largely in the dark as to which sizes of plates were most urgently needed. Accordingly some of them have had men travelling about the shipyards taking stock in detail of plates on hand, so that shipments could be made to bring all stocks to the same level. Other plate mills did not do this. Furthermore, it is probable that some of the present difficulty arises from a misunderstanding between the mills and the yards, the mills feeling that close connection could and should be made between receipts of plates and consumption, whereas the yards claim they need large stocks of every size. However, unfortunate the condition may be, the mills are strenuously engaged in rectifying it, and are now working on the programme of stocking up every yard with a supply equal to 30 to 60 days' consumption of every size involved. This is to be accomplished within a few weeks. Meanwhile plates are scarcer, for other requirements, than they will be later.

### Shell Steel for Canada

Various and conflicting statements are made as to the amount of shell steel that is to be shipped to Canadian shell factories having shell orders from the United States. In addition to whatever

# The MONTREAL Heavy-Duty Rough Turning Lathe

## Description

**BED** is of heavy massive construction, wide and deep and braced with box section girths, ways are flat provision is made at rear side for attaching profiling attachment when needed.

**HEADSTOCK** Cast integral with bed giving great rigidity and permanent alignment. Two gear ratios are obtainable through gearing and change is made instantly by means of jaw clutches. Drive is by 8" belt on backgear shaft through friction clutch. On account of the integral construction the gear [illegible] diameter and the advantage has been taken of this feature. Bearings are [illegible] ample oiling facilities and provided covers are furnished for gears.

**CARRIAGE** [illegible] heavy, with wide bridge [illegible] cuts, plain heavy duty rest with graduated collar, hand feed to cross slide.

**APRON**—One piece double wall type giving support to both ends of shafts. Gears are of steel or semi-steel, worm wheel of bronze. External friction plate of large diameter giving great power for feeds.

**FEEDS**—Three provided through felt from spindle.

**TAILSTOCK** of massive design with long nose making it unnecessary to extend tailstock spindle for ordinary work. Spindle is of large diameter. Four clamping bolts are provided to secure tailstock to bed.

**OIL PAN** of heavy gauge sheet steel.

**PUMP** Triplex Rotary Pump provided for supplying [illegible]

No countershaft is furnished as friction and jaw clutches are part of machine [illegible] shaft.

## Specifications

# INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## ENGINEERING

**Welland, Ont.**—The Welland Iron and [illegible] organized by E. J. Anderson, of Welland, has taken over the old Beatty plant and will establish a brass and iron foundry and also a machine shop. Machinery is being installed and the plant will be in operation shortly.

**Perth, Ont.**—The Canadian Union Iron Mines Corp., Ltd., have commenced operations at their mines near Perth and expect to produce upwards of twenty-five tons of hematite iron ore per day. The company have a contract for twenty-five thousand tons which should be completed during this season.

**Ottawa.**—The British-American Nickel Refining Company, which has been negotiating for property for some time, has decided to locate on the Hull side of the Ottawa River. It is learned that representatives of the company have purchased the property known as the old Conroy piling grounds, at Deschenes, upon which a nickel refining plant, to cost in the neighborhood of $1,000,000, will be erected. The company will employ at least one hundred and fifty hands.

## TENDERS

**Barrie.**—Tenders will be received up till noon, April 25th, for the sale of the ferry steamers Island Queen and Kathleen, as they now lie burnt and damaged at Toronto Island, Toronto. The damaged hulls to be promptly removed and berthed elsewhere to the satisfaction of the harbor authorities. Hugh Calderwood, underwriters' representative, Barrie, Ont.

**Ottawa.**—Sealed tenders will be received at this office until 4 p.m. on Monday, April 22, 1918, for the charter of tug Hercules. This is a steel tug, Official Registry No. 122,217; length, 105 ft.; beam, 24 ft. 6 in.; draft, 10 ft. 6 in.; triple expansion engine of 14¼ in., 22 in. and 36 in. by 21 in. stroke. The tug is in Midland Harbor, Ont., and can be inspected by appointment with the district engineer of the department at that place. Apply district engineers, Midland, Equity Building, Toronto, and office of assistant chief engineer, Birks Building, Ottawa.

**Ottawa.**—Sealed tenders will be received until noon, April 23, 1918, for electric conduit and fittings required in the reconstruction of the Parliament Buildings, Ottawa. All tenders to be based on the supplying and delivering on the site of the quantities of the schedule of material for electric conduit and fittings, in strict conformity with the specifications and the samples submitted and to the satisfaction of the architects. Deliveries to commence so far as possible immediately after the signing of the contract and to continue as directed in such quantities as to ensure complete delivery by June 1, 1918. The schedule of material, specification and any other information required can be obtained at the office of the P. Lyall & Sons Construction Company, Limited, Ottawa; John A. Pearson, architect; J. O. Marchand, associate, Centre Block, Parliament Hill, Ottawa.

## DAYLIGHT SAVING WAS WELL RECEIVED

### Galt Factories Believe It Will Work Out To Good Advantage

Special to CANADIAN MACHINERY.

**Galt, April 17.—The moving forward of the clock and inauguration of daylight saving in Galt was generally welcomed among the employees of this industrial city's many factories and foundries, according to enquiries made by your correspondent.**

**R. M. Hamilton, works manager of Canada Machinery Corporation, said that practically all the workmen in his plant would welcome daylight saving, especially because they would have an extra hour for leisure or work in the garden in the evening. One or two of the employees who, because of the nature of their work, had to be on hand very early in the morning, did not contemplate the change with so much pleaure.**

**The Galt Knitting Co. employs a large number of girls, and James Knechtel, superintendent, said he believed the change would work out very satisfactorily. He had heard very few complaints from the employees. The fact that the measure was now applicable to the whole country did away with its former disadvantages in Canada.**

**D. Hastings, superintendent of the Goldie and McCulloch Co., said he had heard no complaints and he thought the daylight saving scheme would result satisfactorily.**

**His employees did not appear to be very enthusiastic, said James H. Cowan of Cowan and Co., but after the plan had been given a fair trial those concerned would be in a better position to judge of its benefits.**

## PERSONAL

**Hein and Crombie**, consulting engineers, have recently opened an office in the Transportation Building, Montreal.

**C. W. Kirkpatrick**, a well-known Hamilton newspaperman, has been recommended by the controllers for the position of industrial commissioner with a salary of eighteen hundred dollars a year.

**Captain McGough**, one of the veterans of the old sailing vessels, has been appointed acting harbor master in place of Captain Murray, who was killed in the Halifax disaster last December.

**Edgar Mill McDougall** died in Montreal last week. He was president of the Canadian Iron Foundries, Ltd., and also of the John McDougall Caledonian Iron Works. The several companies with which Mr. McDougall was connected were largely represented at the funeral.

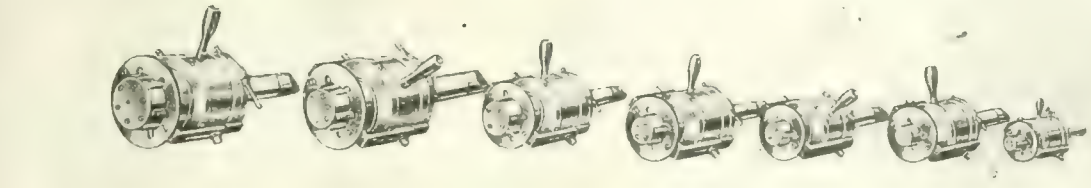
**Capt. W. R. Hutchison**, of the Royal Scots, who was killed in action, was formerly a resident of Montreal, and was connected with the firm of Drummond & McCall Co., iron and steel merchants, J. T. McCall of the company being his uncle. Capt. Hutchison was well known in the old country as a Rugby player, and while in Montreal he was prominently identified with the Rugby game. He was 28 years of age.

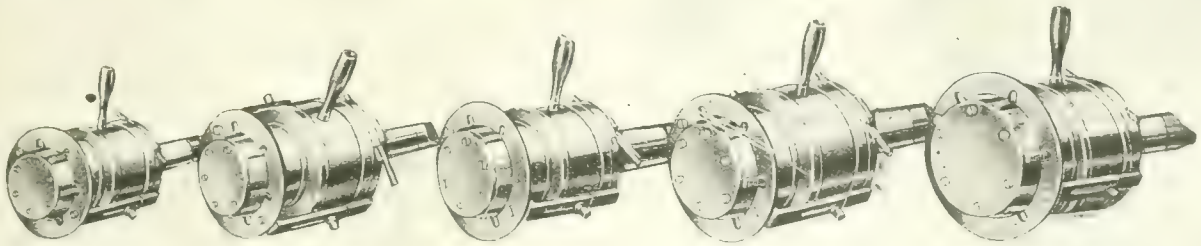
**Thos. Lawson**, head of Thos. Lawson and Sons, P. H. Powers, boiler manufacturer, Andrew Imlack Sr., one of the founders of the Victoria Foundry, and Alex Fleck, of the Vulcan Iron Works, all of whom have been long and prominently identified with the iron and steel industry in Ottawa, have been spending the winter in California. They are expected home about the end of the present month. Mr. Lawson and Mr. Imlack were at Los Angeles, Mr. Powers at Riverside, and Mr. Fleck at Coronado Beach.

**Second Lieutenant Maurice F. Peiler, R.F.C.**, was reported missing on April 6, according to a cable message from the British War Office, received by his father Mr. H. L. Peiler, general manager of the Mason Regulator & Engineering Co., Limited, Montreal. Lieut. Peiler was born in Montreal twenty-one years ago and was educated at the Montreal High School, Berthier Grammar School and Montreal Technical School. For two years he was with the St. Catherine street branch of the Molsons Bank and later accountant with his father's business. He went to Toronto July 6 last and was given his wing as a qualified scout pilot eleven weeks later, was in training in England at the end of October, requalified on November 23, and on the 30th of that month was in France on active service. On February 26 last he downed his first Hun 'plane and bagged two more enemy machines on the 13th of last month.

**Charles F. Sise** is dead at Montreal. He was at the time of his death chairman of the Bell Telephone Co. of Canada. He was born in Portsmouth, U.S. in 1834. He early took to the sea and was made captain before he was 21 years of age. On the outbreak of the Civil

# GEOMETRIC TAPS





# FOR U.S.

## SIZES 3/4" TO 6"—AT A U.S. ARSENAL

THIS illustrates only one of the groups of Geometric Collapsing Taps that have gone into United States Arsenals and Navy Yards to bear out the reputation that attaches to all Geometric Thread Cutting Tools.

These taps are equipped with the roughing and finishing attachment, a feature of Geometric Taps that are required for close work.

A micrometer scale adjusts them for a tight or loose thread. Because of the adjustable feature, Geometric Taps always produce accurate threads, no matter how often the chasers have been ground.

When ground beyond further use, the chasers may be replaced, while the tap remains as good as new.

Chasers recede automatically when the required depth of thread is reached.

Geometric Collapsing Taps can be fitted to Screw Machine or Turret Lathe, also live spindle.

Why not put your tapping proposition up to a Geometric?

**THE GEOMETRIC TOOL COMPANY**
**NEW HAVEN CONNECTICUT**

***Canadian Agents***

Williams & Wilson, Ltd., Montreal. The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg, St. John, N.B.

*If interested, tear out this page and keep with letters to be answered.*

War, Mr. Sise acted as private secretary to Jeff Davis. He was also engaged in running blockades, taking in arms and ammunition. In 1879 he undertook the work of bringing all the various telephone companies under one head on a national basis. Mr. Sise identified himself with other important business corporations of Canada, having been a director at various times of the Bell Telephone Company, the Wire & Cable Company, the Northern Electric & Manufacturing Company, the North American Telegraph Company, the Canadian Westinghouse Company, the North British & Mercantile Insurance Company, the Sincennes-McNaughton Line, the Nova Scotia Telephone Company and the New Brunswick Telephone Company, and many years ago of the Royal Electric Company of Montreal, of which he was at one time vice-president.

# TRADE GOSSIP

**Will Purchase Truck.**—Chatham will purchase a motor service truck from the American La France Co. for $9,325.

**Using Old Factory.**—The Thornton Rubber Co. are fitting up the old malleable range factory at Oshawa for the manufacture of rubber textiles to be used largely in motor car tops.

**Industry Closed Out.**—The works of the Crossen Car Co., Cobourg, have been dismantled and most of the machinery disposed of. The one-time active Cobourg industry thus passes out of existence.

**A Joint Stock Co.**—The Tallman Brass & Metal Co., of Hamilton, has been changed into a joint stock company and is branching out into different lines of brass work. The present partners will become directors of the new company.

**Who's Behind It?**—Considerable interest is attached to the controversy now going on in connection with the formation of the Dominion Steel Workers' Union at Sydney, N.S., which is seeking incorporation.

**'Phones Hard to Get.**—The demands that are being made on the supply of telephones by the military and allied concerns make it hard to get these instruments for private houses and there is considerable delay.

**Fire in London.**—Fire of unknown origin destroyed the sawmill of D. H. Gillies and the showcase works of John H. Campbell, Bathurst street, London, on Saturday evening. The total loss will exceed $40,000, which is partly covered by insurance.

**Gas Supply Is Short.**—Large industrial consumers of natural gas in Western Ontario will in all probability be compelled after July 1 next to use other fuel, according to the policy outlined by the Ontario Railway and Municipal Board in a circular letter sent out yesterday to the producing and distributing companies.

**Shows an Increase.**—The statement of operations of the Nova Scotia Steel and Coal Company for the first quarter of the present year shows little change in volume of output as compared with the third quarter of the previous year. A good increase, however, is shown in the tonnage of iron ore mined.

**May Move Plant.**—At the meeting of the Hamilton Board of Trade Controller Jutten urged that the influence of the board be exerted towards retaining for Hamilton the bolt works of the Grand Trunk Railway, which the railway propose to move to some other point. Secretary Brown was instructed to take the matter up with the head officials of the Grand Trunk Railway.

**A Coal Shortage.**—Warnings that a shortage of bituminous coal exists were issued in New York by fuel authorities. The situation is so serious, according to Harry T. Peters, chairman of the State Fuel Conservation Committee, that "we will be back where we were last winter unless something is done to relieve matters." March was the worst month in point of production during the past year and a half, Mr. Peters asserted.

**Canadian Cars in United States.**—At Ottawa Mr. Casgrain was told by the Minister of Railways that 18,146 Canadian box cars and 5,531 stock cars are at present in the United States and due to Canadian railways. The Government, said the Minister, had taken action on different occasions to secure the release of these cars, and would continue to impress upon United States authorities the necessity for returning them as soon as possible.

**Shortage of Power.**—Militia Department instructions to give flour mills preference compelled London to hand over 300 horse-power from her scanty Hydro allowance to a new mill here. As a result it has been found necessary to arrange a schedule under which the factories of the city will close one hour each day. The city will be divided into eight areas and one will close down each hour, thus reducing the total Hydro load through the whole period.

**Pedlar People Extending.**—The Pedlar People Limited, of Oshawa, have completed a building 125 x 80 for their culvert department, thus making room in another section of their factory for their sheet metal stamping department, a new branch of their industry. This is equipped to handle certain lines of motor car work as well as serving other industrial purposes, including the marine field. The Pedlar People are now employing 250 hands.

**The British-American Shipbuilding Co.,** who leased part of Beatty & Sons' plant at Welland, Ont., will shortly launch the first 3,500-ton steel freighter, which they are building for the Imperial Munitions Board. The vessel is 261 feet long, 43 feet broad, 23 feet deep. On the second hull the keel and floor frames are down and about 50 per cent. of the steel has been fabricated. Arrangements are being made for a third berth. The officials of the company are as follows: H. F. S. Estrup, president; H. A. Sifton, vice-president; H. M. Balfour, general manager; H. D. Davison, treasurer, and G. A. Leonard, secretary.

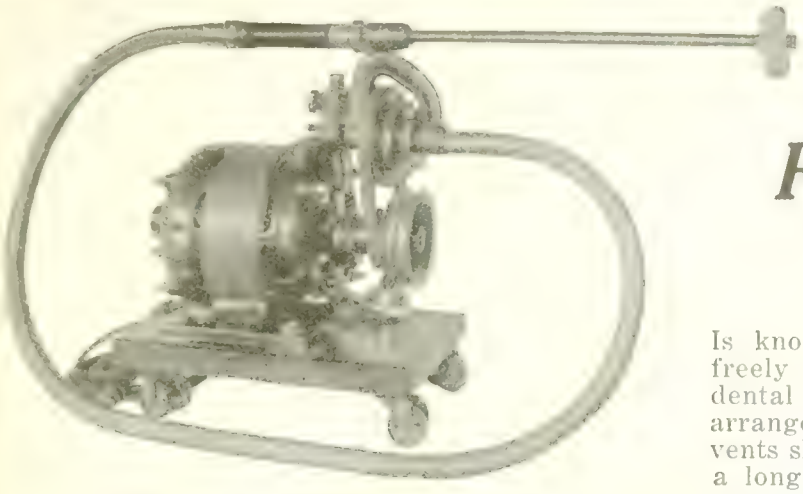
**Profits Increase.**—The annual statement of the Canadian Fairbanks-Morse presented to the shareholders shows net earnings after operations and tax reductions amounting to $1,033,817. After allowing for depreciation of $251,843, the earnings amount to $781,974, as against net profits after depreciation of $636,629 in the previous year. Preferred dividends for eighteen months amount to $135,000, leaving $646,974 available for common dividends, which amounted to $436,000. Surplus for the year totalled $210,974, which with the surplus of $1,129,466 forwarded from the previous year, brings total surplus to $1,340,440.

**Sydney, N.S.**—The Sydney Mines dispute has been amicably settled as the result of a conference which commenced last night in Sydney Mines and had not been concluded until after 1 o'clock in the morning. Representing the Nova Scotia Steel and Coal Co. were General Manager Adams and Superintendent Cunningham, and representing the men were Vice-president Robert Baxter, Secretary-Treasurer J. B. McLachlan, and George Bagnall, of the Amalgamated Mine Workers' Union, and seven Sydney Mines men, John Stewart, Robert Williams, James Daley, Adam Scott, Henry McKinnon, Charles Foster and Louis Speers.

**Want a Bounty.**—An Ottawa despatch says: "The Canadian Government is giving serious consideration to an application of the Central Iron Committee of Vancouver Island for a federal bounty to stimulate the production of iron and steel from British Columbia ores. Bounty of three dollars ton iron, same on steel up to 500 tons per day, with $2 per ton beyond that to 1,000 tons asked. British Columbia members with R. R. Neild and J. F. Bledsoe had several meetings with the Government. Acting Finance Minister McLean yesterday stated to the meeting he expected the Government would almost immediately be in a position to deal with the question.

**Canadian for Australian Railways.**—The premier of the state of Victoria has announced that to fill the vacancy caused by the recent death of one of the railway commissioners it was the intention of the government to secure the services of a capable and experienced commissioner from abroad. It is understood that already applications have been received from ambitious men now in the service of Canadian railways for the position which—for the present at least—is not that of chief commissioner. The present chief railway commissioner receives a salary of £2,500 (but the last chief commissioner from oversea received a salary of £3,500) and the second and third railway commissioners, respectively, receive a salary of £1,750.

**Trade Consolidation.**—One of the most interesting examples of after-war trade organization in the engineering industry is shown by the well-known firm of Dick, Kerr & Co., Ltd., the development of whose business organization during the war has been such as to place this firm in an exceedingly strong position. For many years past Messrs. Dick, Kerr &



Drill chuck is quickly and easily attached by simply removing the detachable handle and wheel. And there's no overloading of the motor. Three-speed countershaft and belts prevent that.

# Aikenhead's Flexible Shaft Grinder

Is known in Canada as the one machine freely flexible and yet proof against accidental short bends. The automatic stop arrangement of this Aikenhead machine prevents short bends. The metal casing gives it a longer service life by years than that of unarmored machines.

**For Cleaning Out Shells of All Sizes**
**For Light Grinding, Polishing, Drilling**

You will find this Aikenhead Flexible Shaft Grinder an economizer of time and labor—a machine that does much in little time.

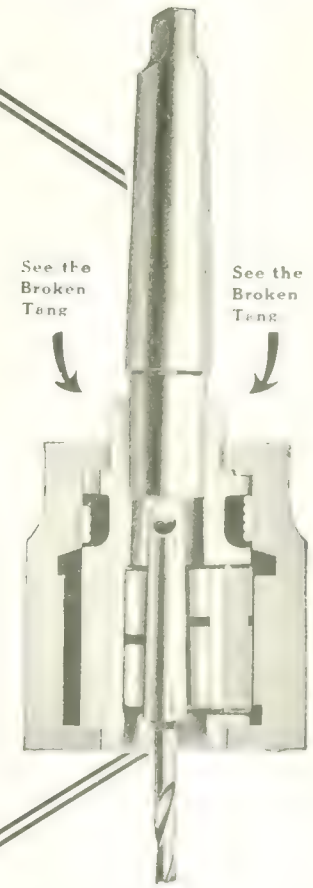
**Write for complete details.**

## Aikenhead Hardware Limited

**17, 19, 21 Temperance Street, Toronto**

## Use M. T. Shank Tools With or Without a Tang

This Automatic Chuck grips by the entire shank — enables you to use numbers 1, 2 and 3 Morse Taper Shank Tools with broken tangs—and that's the least of its advantages.



# Aikenhead's Wahlstrom Chuck

Eliminates waste of time, waste of motion. It acts instantly. It centers the tool itself automatically. It enables your operators to make tool changes in less than two seconds.
And a tool in the grip of this Aikenhead Wahlstrom Chuck can never slip. If the resistance on the tool is great, the holding power of the jaws is great proportionately.
There is an Aikenhead Wahlstrom Chuck for Straight Shank Tools as well as Taper.

**Write for Particulars.**

## AIKENHEAD HARDWARE LIMITED

**17, 19, 21 Temperance St., Toronto, Ontario**

equipment of electric railways and tramways, waterworks, factories, etc., with a [illegible] works at Kilmarnock and large works at Preston for the manufacture of steam turbines, electrical machinery and electric lamps. Recently they have also taken over the control successively of the old-established business of Willans & Robinson, Ltd., of Rugby, well known as builders of steam turbines and Diesel engines, and of the United Electric Car Co., Ltd., of Preston, prominent manufacturers of railway and tramway rolling stock; and in addition have completed a joint manufacturing and selling arrangement with the Phoenix Dynamo Mfg. Co., Ltd., of Bradford, in regard to certain classes of standarized electrical machinery. One effect of this unique combination of engineering interests is that while the combined technical and manufacturing knowledge of the associated firms will be available for all, yet each works can confine its output to those products for which it is best equipped.

## MARINE

The Greenfield Tap and Die Corporation of Greenfield, Mass., have issued a new pipe tool catalogue, No. 38. It is a revised and completed edition of the first catalogue of this number, which was issued some time ago.

**Victoria, B.C.**—That the Victoria Machinery Depot has been offered contracts by the Dominion Government for the building of three steel ships of 5,100 tons each and that it has declined the offer is stated by C. V. G. Spratt, head of the company.

The Vanadium-Alloys Steel Co., of Latrobe, Pa., have just sent out a new stock list of Red Cut Superior high speed steel. As there is such a demand for the various sizes in this line, attention should be paid to the latest lists to be sent out by the company.

The Whiting Foundry Equipment Co., of Harvey, Ill., have issued a catalogue of crane ladles, truck ladles, bottom tap ladles and shank and hand ladles, etc., also a bulletin. The latter is a list of firms in all parts using the cupola made by the Whiting Company.

**Cleveland.**—The great lakes fleet is to begin the 1918 season with a greater carrying capacity than last year, despite the fact that the government has drawn on it for several boats for the war. The tonnage available for 1918 will be 3,503,450 gross tons. This is 14,500 tons greater than at the close of 1917.

**Kingston.**—The ice is out of the harbor. The terrific wind storm of Monday night did the trick. On Monday mariners were of opinion that it would be a week or possibly ten days before the ice would move out, but they guessed wrong. The heavy rain followed by [illegible] to work the ice out, and when citizens awoke on Tuesday morning they were glad to hear the news about the ice getting away.

The Greenfield Tap and Die Corporation have issued a souvenir booklet in connection with the formal opening of their new office building, shipping room and recreation building on March 5. The erection of these two buildings marks the complete amalgamation of the various units and divisions of the Greenfield Tap and Die Corporation with its various plants in different parts of Greenfield. The booklet is a handsome one, the work of W. L. Robbins, advertising manager of the company.

**Ottawa.**—The Dominion Government will resume control of the harbor at Port Dover, will repair damage done to it by storms, and will place it in condition to accommodate cargo and other vessels, Hon. F. B. Carvell, Minister of Public Works told a large delegation which waited upon him. The cost of repairs immediately required would, Hon. William Charlton estimated, amount to from $60,000 to $75,000, and a larger scheme of improvements would cost from $234,000 to $575,000, according to the plan adopted.

**Vancouver.**—The Canadian Explosives Limited has bought the yacht, White Cloud, from Captain Pybus, formerly commander in the C. P. R. transpacific service, and will use the craft as a ferry between James Island, Sydney and Saanichton. She has left Vancouver for Victoria, where she is undergoing some alterations to fit her for the service. The White Cloud was built at Hongkong and attracted much attention when she arrived here because she was rigged after the style of a Chinese junk and carried junk sails. She has a powerful auxiliary engine.

**Toronto.**—Until April 25 the western entrance of the harbor will be closed to navigation while dredging operations are conducted, according to an announcement made by the harbor master. The closing of the Western Gap means that about thirteen minutes must be added to the time which boats coming from Hamilton require for the trip, as they must sail round outside the island and enter by the eastern channel. It is announced that should the weather be stormy, ships may use the western entrance, and on stormy days the order does not apply. Two coal boats from Oswego are expected to arrive next week.

**Detroit.**—In comparison with the similar date last year, there is less ice reported on Lake Superior and Michigan, somewhat more in Lake Huron over the southern portion, in Lake Erie over the eastern portion, and also in Lake Ontario, says the sixth of the season's bulletins on lake ice conditions issued by the United States Weather Bureau in connection with reports from regular and display stations of the Weather Bureau and the Meteorological Service of Canada. During the week the ice has broken up and disappeared from most of the lakes. In Lake Superior the field has moved back to the extreme west end, and extends from Duluth beyond vision. Over the central portion the fields have moved beyond vision. At Whitefish Point the fields in the lake are moving in and out with the winds, and the ice in the bay is breaking up and becoming soft.

**Collingwood.**—The boilermakers and iron shipbuilders in the Collingwood shipyards have reached an agreement with the Collingwood Shipbuilding Company, by which the men obtain an average increase in wages of 25 to 30 per cent., a nine-hour day, instead of a ten-hour, recognition of the grievance committee of the men, and a signed agreement with the company for a year, commencing April 9. This is the outcome of the Board of Conciliation and Investigation, which recently convened in Collingwood. The chairman of the board was Hammett P. Hill, of Ottawa; Fred Bancroft, of Toronto, represented the men, and Capt. J. B. Foote the commany. The agreement provides the following rates of wages for new work, which are increased 2½ cents per hour for old work; new work rates, boilermakers, ship fitters and hand rivetters, 50 cents an hour; holders-on, 54c; heaters, 35c; chippers and caulkers, 50c; reamers, 35c; drillers, 40c; bolting up, 32½c; punch and shear men, 40c; punch shed helpers, 33½c; furnace-men, 50c; slab helpers, 40c; plate hangers, 40c; general helpers, 32½c; acetylene burners, 47½c; acetylene welders, 50c. Twenty occupations are included in the schedule.

**Montreal.**—Notices were yesterday served on the Board of Trade and other business interests by the Montreal Harbor Commission that their charges on wharfage on goods handled over the Montreal wharves and on cars, switched by the Harbor Commissioners' Railway, would be increased by at least 25 per cent. on the wharfage charges, and 50 cents a car on the switching movement of cars handled by the harbor and front railway. This, it was stated, will mean as to wharfage charges that on all general merchandise there will be an increase of at least 5 cents a ton, making the charge 25 instead of 20 cents. On special commodities, such as grain, the wharfage charge is increased from 3 to 5 cents per ton; on flour, from 6 to 8 cents per ton on wood pulp, from 6 to 8 cents per ton; on asbestos and asphalt and whiting, from 8 to 10 cents per ton; on hay, news print, sulphur and tar, from 12 to 15 cents per ton; on pig and scrap iron, from 16 to 20 cents per ton; on lumber and timber, from 8 to 10 cents per 1,000 feet, board measure; and on bricks, from 8 to 10 cents per 1,000.

**Toronto.**—H. W. Cowan, operating manager of the Canada Steamship Lines, announces the following appointments to the different freight steamers on the lines of the company for the season of 1918:—(J. W. Grainger is the mechanical superintendent). Steamer, W. Grant Morden, captain, Neil Campbell; engineer, Robert Chalmers, J. H. G. Hagarty, G. W. Pearson, Charles Robertson; Emperor, D. W. Burke, George N.

# Rapid Deliveries

In times like these situations constantly arise which makes rapid delivery of orders of first importance. When in need of chucks on such occasions order

## *Almond Lathe Chucks*

We are equipped for immediate deliveries on 5", 6", 7½" and 9" chucks.

Forty years of successful experience behind Almond Chucks. Powerful, accurate and durable.

UNIVERSAL GEARED SCROLL CHUCK
COMMON JAWS, FIG. 1.

**Almond Micrometers** Another of our lines on which you can count on quick deliveries. Almond Micrometers are high in quality and thoroughly dependable. **We recognize comparison with Johansson Swedish Gauges only.**

## INCORPORATIONS

**Lee Coal Co., Ltd.,** has been incorporated at Montreal, to carry on as coal and coke dealers, to deal in copper ores, etc. Capital stock, $25,000.

**Canadian Fluorite, Ltd.** has been incorporated, with head office in Toronto, with capital of $500,000. The company can acquire, own, lease, etc., metals and minerals.

**Grace & Co. Ltd.** have been allowed to increase their capital from $100,000 to $500,000. The powers of the company are also enlarged to build, construct, etc., ships, vessels and tugs.

**Can Conservers of Canada Ltd.** has been granted incorporation in Toronto, to purchase, conserve, collect, make, tin cans, sheet metal goods, labels and canners' supplies. Capital is $100,000.

**Sparling and Reeson, Ltd.,** have been incorporated with head office in Cobourg, the capital stock being placed at $40,000. They can manufacture, buy, sell and deal in merchandise, motor and other vehicles, etc.

**Dominion Metal Exporting Co.** has been incorporated to take over the junk and mercantile business of M. Tessler, J. Gashfield and B. Stanikaff, operating under the above name. Capital is $500,000, and the place of business is at Winnipeg.

**The Buckingham Mines, Ltd.** has been incorporated, with head office in Toronto. Capital one million. Authorized to develop mineral lands and refine ore, etc. Provisional directors, Ira Marks, W. I. Marks, J. R. Curry, H. Burgess and W. Williamson.

**Morris-Knowles, Ltd.** has been incorporated, with head office in Windsor. Capital stock is $40,000. Provisional directors are M. Knowles, J. M. Rice, G. F. Maglott, N. Jacobs and C. W. Tarr. They are to act as consulting and advising engineers.

**Cleanall Soap Co., Ltd.,** has been granted incorporation, with head office in Toronto, to carry on business of soap manufacturers and to buy and sell cleaning supplies, machinery and accessories. Provisional directors are J. O. Paterson, G. O. Paterson and C. E. Paterson.

**The (Canadian) Young High-Velocity Carburettor Co., Ltd.,** has been incorporated at Toronto, with capital placed at $500,000, to make, build, buy, etc., automobiles, motor cars, tractors, tools, machinery, etc. Incorporators H. H. Davis, E. H. Brower, L. A. Landriau, H. B. Spaulding and N. Boynes.

**Grain Growers Auto Tractor Co. of Canada** has been incorporated, with head office in Montreal, and capital of $100,000. The purpose of the company is to make, import or export all kinds of agricultural implements and other devices, etc. The incorporators are J. H. Rainville, J. O. Gagnon, Albert Maynard, A. Brodeur and E. Rainville, of Montreal.

**International De Lavaud Mfg. Corp., Ltd.,** has been granted incorporation at Toronto, to manufacture and deal in all kinds of metal, and carry on machine shop practice, etc.; to deal in metals and materials of all kinds, and to carry on business as general engineers and contractors. Capital is placed at six million. Incorporators, E. W. McNeil, W. D. Toye, V. E. Haye, G. M. Bell, W. E. Eckhardt, H. J. Dawson, C. B. Carte, S. H. Young, E. G. Ahern, C. D. Dyke.

## CATALOGUES

**The Geometric Tool Co.,** of New Haven, Conn., issue their April edition of "Threads," devoted to screw thread cutting. It contains besides machinery news a considerable amount of matter of a patriotic nature. It concludes with the advice "Men are born with two eyes and one tongue, in order that they should see twice as much as they say."

**The James Morrison Brass Mfg. Co.,** under the heading "Bulletin 50," issue a 60-page booklet of marine specialties. As the end of the book is a very handy table giving dimensions of flanges, standard spigots, etc. The book is one that will prove interesting and useful to any one in the trade.

**The Chas. Strelniger Co.,** Detroit, have issued a handsome anniversary number stock list. In March last year they moved to their new store, this being the 34th year since the business was established. The catalogue is a well prepared one, setting forth in generous description and photograph the "Everything for the Shop" policy of the firm.

### TRADE INQUIRIES

THE following trade inquiries have been received by the Department of Trade and Commerce, Ottawa. Further particulars may be obtained from the Inquiries Branch of the Department:—

184. **Sulphuric acid, carbonic acid gas and anhydrous ammonia.**—A firm in St. Kitts, with an aerated water factory, desires to import the foregoing products.

185. **Lubricating oils.**—A firm in St. Kitts, British West Indies, requests to be put in touch with Canadian manufacturers of lubricating oils.

201. **Carbide.**—A Johannesburg com-

### CANADA'S EXPORT TRADE

PRESENT world-wide conditions are anything but favorable to the development of an export trade for Canada owing to abnormal domestic industrial conditions and the difficulties of ocean transportation, yet the Export Association of Canada shows no signs of discouragement, but is, on the other hand, determined to press on with the work along the lines originally adopted. This is the cultivation of trade connections with reliable sources throughout the British Empire and the other allied countries, and the encouragement of Canadian factories to compete for export business in these markets. The report, just published, adds:—"Whether Canada will enjoy tariff preferences after the war is still doubtful; if these materalize so much the better, but whether they do or not, our duty is clearly to organize in this present trying period so that when more normal conditions prevail we may do our share toward filling our munition factories with commercial orders, providing employment for our returning soldiers, and helping our country to arrive at a balance of trade which will enable her to meet her national obligations. Small as may seem the beginning we have already made in this direction, the organization work which we have already accomplished must eventually yield excellent results."

## U.S. IMPORTS NOT TO BE CUT OFF

"Late advices to THE FINANCIAL POST from Ottawa indicate that the recommendations of the War Trade Board for restricting imports from the United States into Canada will be held up indefinitely. There is strong opposition from certain members of the Cabinet, it is understood."

Above is a quotation from a brief article which appears on the first page of THE FINANCIAL POST of April 13th. Its importance to merchants and manufacturers in Canada makes this one of the outstanding articles in this week's issue. THE FINANCIAL POST has from the first followed closely every aspect of the exchange situation, and can be relied upon to give the first and most accurate news on this and other important matters affecting Canadian business.

### LACK OF WHEAT MAY SHUT MILLS

In the same issue of THE FINANCIAL POST, on the front page also, appear two tremendously important articles. Under the heading "Lack of Wheat May Force Mills to Shut Down" the information is given that unless the Kansas crop can help out, Canadian mills may be idle for a considerable period this Summer for want of wheat. Side by side with this, however, appears the encouraging news that Canada is sowing three million acres of wheat more for 1918 than were sown for 1917 harvest. This is one of the articles contributed every week to THE FINANCIAL POST by the editor of "Farmers' " Magazine." THE POST has the benefit of the specialized skill of the editors of twelve other business papers each with a distinct field of its own, in the Maclean Business Newspapers, and THE POST'S own editorial staff is expert and represented at strategic centres for securing all important business news.

### BUSINESS NEWS OF THE WEEK

The following headings from this week's issue of THE POST indicate the scope of POST service, though not by any means representing the whole contents of THE POST—

**Valuable London Utilities Wrecked.**
**Strong Protest Entered Against B.C. Legislation.**
News of Securities—Markets Firm.
Government to Pay More for Fish.
New Shipbuilding Plant for Port Hope.
Great New Gun Works for States.
Big Decline in Exports to United States.
Bank Clearings Show Increase on "Short" Week.
Encouraging Farmers to Keep Books.
Price Fixing Will Not Attain Desired Ends.

To get the business benefit of the important articles in THE FINANCIAL POST each week just sign and send this coupon:

### PITTSBURG MARKET LETTER

Continued from page 420.

movement there is now, and was planned against shell steel orders placed some time ago, there is a fresh tonnage apparently, for it is stated an arrangement has been made whereby Canadian railroads withdraw enquiries for 285,000 tons of rails in the United States, these rails to be found in Canada, while the United States will make more shell steel for consumption in Canada.

#### The Markets

The markets continue extremely dull, as to pig iron, unfinished steel and finished steel. The greatly increased output of pig iron has not resulted in an easier situation, as the needs of consumers appear to have increased as rapidly as the production, and the output is going on old contracts. In unfinished steel there is more enquiry but no more offerings. One large steel interest has bought both ingots and billets in the open market and will buy more if offered. Finished steel shipments have been much heavier, but are readily absorbed. The Steel Corporation's unfilled obligations were 9,056,404 tons at the end of March, showing a decrease of 233,049 tons during the month. This decrease was equal to 18 per cent. of the capacity, and estimating shipments at 90 per cent. the bookings were about 72 per cent., or much more than in February and slightly more than in January. The bookings were chiefly of war material.

Coke shipments in the past week have been slightly heavier and somewhat greater production of pig iron and of steel is therefore in prospect. Foundry coke is still very difficult indeed to obtain.

### BORNEO HARDWOODS

ALTHOUGH Borneo hardwoods are little known among European importers and users of timber, they are going ahead in Oriental markets, and British importers should note this fact for reference when the trade in hardwoods on this side of the world emerges from its present state of stagnation. Timber imports into Hong-Kong amount to about 30,000 ft. a year, more than half of which is hardwood.

British North Borneo produces some excellent heavy woods, the chief being "billian" or ironwood, of which many shiploads go to Hong-Kong and China every year. Being ant-proof, this timber is in request for building purposes in the tropics, and it is also useful for cabinet work and flooring. "Russak" is another hardwood similar in many respects to "billian," but not so heavy. The supply is unlimited. "Sereyah" or redwood, a comparatively soft wood, resembling Californian redwood, has been shipped to Australia for use in railway carriage construction. "Greeting" is a good imitation of black oak.

# Lowering the Cost of Getting Orders

THEY were talking about the high cost of getting orders—were Brown and Jones. They were agreed on some things: train service was interfering with ability of salesmen to call on as many as formerly; hotel bills were adding heavily to the weekly expenses of salesmen; congested freight and express service was interfering with quick deliveries; salaries of men were going up; labor of all sorts, as well as materials, was becoming higher priced.

Then Brown said: "I am giving a good deal of thought to the training of my salesmen. I am endeavoring to make them produce more business—to sell more goods, and to reduce the number of futile calls. I notice that they are giving much attention to this subject in the United States, and that in Canada some firms are paying serious attention to this matter of better salesmanship."

"What are you doing?" said Jones.

"Well, I haven't done a great deal so far, for I am in the initial stages of my studies. But one thing I have learned: it is that my men haven't been analyzing the causes of their failures to make sales. I can't blame them, for I myself haven't troubled myself to dig into this phase of the selling game. Now I am asking myself and my men—Why the failure to get the order?

"I have discovered a good deal. One thing is that my men haven't known enough about the goods they took out to demonstrate them convincingly. This is largely our fault. So we are using time and printed matter to make our men know exactly what they have to offer.

"Another thing we have had impressed on us is that our men haven't been approaching their prospects always in the best way. They have been too keen to sell rather than to serve.

"I saw a thing the other day that is good—by a man named Casson. He said the average salesman's method was "Talk—Argue—Compel.' As against this, he recommended: Listen—Agree—Oblige.

"What he means is that the salesman must get on the side of the buyer if he is to have best results. And so I am doing something to get my men trained to acquire the point of view of the man they canvass—this first. When a salesman postpones his sales talk until he has won the interest and attention of the prospect, he is in a much more favorable position to put across his proposal.

"I read recently an advertisement of the FINANCIAL POST in which it told of Frank Mutton, President of the International Business Machines Company, in which he said that he has subscribed to THE POST for each of his salesmen in order that they may be well informed about business conditions and affairs in Canada—this as an aid in making sales. The idea, I infer, is to make his men quick to get the point of view of the men they are to canvass—to become possessed of a kind and amount of information which will enable them to make themselves interesting to prospective buyers of time-recording machines.

"Now, I have known Mutton for many years—known him to be a super-salesman. In subscribing to THE POST for his salesmen, I saw one of his methods—secrets, if you like. So I got THE POST myself to see how my men could make use of it for the same objects.

"I have subscribed to THE POST for 4 months at the cost of a dollar per salesman, and I have been having my men report to me in writing just how they are finding The POST useful to them. They read THE POST with one question uppermost: What item or article in this issue can be used by me to help me make sales?

"I want to tell you, Jones, that I am delighted with the experiment. The minds of my men have been stimulated. They are "cashing in" on what they read. They relate certain items or articles to certain prospects, and they are approaching their customers with greater confidence, greater art, and with more persistency, born of a surer knowledge of how our product is worth the other man's consideration and purchase.

"My men are bringing in more business, and this offsets the increasing costs of going after business."

A VERY suggestive conversation, is it not? The point of its reproduction here: If you think the idea put into operation by Brown (and Mutton who is paying for 50 subscriptions for men in his employ) is worth your consideration, then investigate THE POST for yourself. Instruct us to send THE POST to you that you may investigate it from the angle—What is there in this paper that my men can use to help them "get next" their prospects with a view to making more sales and in quicker time?

So we suggest to you that you sign the coupon below.

Just what does the FINANCIAL POST aim to do? The answer is: It gives business men information about every important happening in every part of Canada as this happening relates to Business. It follows the various listed and unlisted securities, and gives each week clear and accurate and up-to-the-minute information about them. It tells about the movements and influences affecting such groups of investment interests as Iron and Steel, Textiles, Milling, Pulp and Paper, Transportation, and so on. It has numerous contributed articles of first-class interest and importance. It contains much personal matter—notes and sketches about men of influence or position in the public eye whose doings or sayings have relation to Business. Withal, THE POST is extremely readable. It is edited and prepared by trained journalists—the highest-priced staff of men on any publication in Canada. All this makes THE POST a "different" paper, and a good one. The subscription price is $3.00 a 52 issues—Saturdays; or 4 months for one dollar.

### REPRESENTATIVES WANTED

TO HANDLE ONE OF THE BEST FACTORY [illegible] a fair amount of attention to this line will be able to make good thing out of it. Give particulars (in [illegible] etc. [illegible] (c17m)

CANADIAN AGENT WANTED TO HANDLE line of drinking fountains made in Canada. Man calling on manufacturing plants, public buildings, etc., preferred. Box 393, Canadian Machinery. (c16m)

## WANTED

WANTED [illegible] Hydraulic Press with 30-ton [illegible] and oil pump to control, complete with accumulator and pump. Canadian Hart Wheels, Limited, Hamilton, Ont. (c17m)

WANTED — IMMEDIATELY ONE SECOND-hand compound rest lathe, back gear 4 ft. to 6 ft. bed. Also one shaper 12" to 18" stroke. Central Tools & Forgings Ltd., Winnipeg. (c18m)

## SPECIAL MACHINERY

H. C. THOMAS, GENERAL MACHINE SHOP, tools, jigs and machine repairs. 301 King St. W., Toronto. Telephone Adelaide 3836. tf

MANUFACTURERS—WE CAN UNDERTAKE work to any specification munition production equipment or otherwise. Write W. H. Sumbling Machinery Co., 7 St. Mary St., Toronto.

JAMES BAIN & SON, GENERAL MACHINists, Hamilton, Ont.—Machinery repair work. Special machinery built.

## BUSINESS OPPORTUNITY

PRESENT OWNER FARM MACHINERY manufacturing business wants an associate [illegible] $5,000 for office and financial end of business. Sixty-eight years' good reputation [illegible] Apply in own handwriting. Box 398, Canadian Machinery. (c16-18m)

## FOR SALE

FOR SALE — PLATING AND POLISHING plant, complete, in first-class running order. To manufacturers now sending out their plating this is an opportunity to acquire a high-class equipment at a low price. Must be sold and moved quick. Garland Stove & Foundry Co., Hamilon. (tf)

FOR SALE MACHINERY HEAVY BENDING brake, power punch, foot punch, folding machine, forming rolls, 35" exhaust fan, double spindle polishing lathes, upright drill, circular saw table, grindstone, two anvils, eight vises, and miscellaneous tools. Bargains for quick sales. Garland Stove & Foundry Co., Hamilton. (tf)

SECOND-HAND DIRECT CURRENT GENERator, 60 k.w., 110 volts, 680 r.p.m., compound wound; can be used as 880 h.p. motor. Helena Costume Co., 190 King Street, London, Ont. (c16m)

FOR SALE—NO. 2 CLASS F. REEVES VARiable speed transmission; 12 h.p.; also Granger three-roll steam polisher, rolls 16 in. dia. by 36 in. long. Apply Box 205, St. Catharines, Ont.

FOR SALE.—ONE BAND SAW; FOUR-SIDED moulder, double shavings fan, 14" opening; single shavings fan, 14" opening; wood split pulley, 8½ ft. diameter x 12" face; wood split pulley, 6 ft. diameter x 14" face; 18" rubber belt in good condition, about 50 feet. Address St. Marys Wood Specialty Co., Ltd., St. Marys, Ont. (c16m)

1 EXTRA HEAVY HAND-SCREW PRESS made by the Board-Manufacturing Company of Chicago; 1 No. 1 Garvin Screw-slotting Machine; 1 large improved Thurston Die Milling Machine, with or without die sinking attachment; 1 three horsepower Westinghouse motor, twenty-five cycle, three phase, 110 or 220 volts, 1,120 R.P.M.; 1 three horsepower Westinghouse motor, twenty-five cycle, three phase, 1,120 R.P.M., 550 volts; 1 No. 5 Barnes Engine Lathe 1 type No. 18 Brown, Boggs Punch Press. Stanley & Aylward, Ltd., 53 Richmond St. East, Toronto. (c17m)

## PATTERNS

TORONTO PATTERN WORKS, 65 JARVIS Street, Toronto. Patterns in wood and metal for all kinds of machinery. (cfm)

## FOR SALE

FOR SALE 8 to 9 tons 30 x 96 16 gauge O. H. Black Sheets. Immediate shipment from Hamilton. Good condition. Garland Stove & Foundry, Hamilton. (c16m)

## WANTED

ADVERTISER WOULD PURCHASE SECOND-hand punch press if in good condition. Press must have at least three-inch stroke and weigh five thousand pounds or more. Either back geared or direct drive. Box 395, Canadian Machinery. (c16m)

ADVERTISER WILL SHORTLY BUILD A foundry and is open to buy equipment of any foundry now for sale. Give complete list of what you have. Box 396, Canadian Machinery. (c18m)

WANTED No. 1 ROOT BLOWER OR SIMIlar machine, also No. 3 or 4 Hilles & Jones Punch and Shear or similar machine. Must be in good condition. Box 397, Canadian Machinery. (c18m)

## Manufacturers' Opportunity

Our capacity being totally absorbed by increasing business in our transmission lines, we have decided to dispose of the following:—

100—½ and 1 ¼ H.P. air-cooled gas engines in semi-finished condition, with patterns, jigs, etc.

Patterns, gauges, jigs, special machinery for manufacturing three sizes of threshers, very well known in Province of Quebec.

Patterns, gauges, jigs, etc. of 26" band saw, jointer, cordwood saw bench.

With this equipment is included all drawings, cuts, shop details and present repair business and good-will of the company in above lines.

Attractive bargain to serious party. Apply to The A. Bernard Industrial Co., Fortierville, Que. (c16m)

## MACHINING EQUIPMENT FOR 4.5 HOWITZER SHELLS FOR SALE

4—Hall cut-off machines, six inch.
6—Heavy duty lathes.
5—Canadian turret lathes.
2—Pollard boring machines.
1—Jones & Lamson recentering lathe.
8—Davis turret lathes, with cross slide feed.
2—Thread millers for nose.
1—Holden Morgan Miller for base end.
1—Notching miller, Monarch Brass Co.
1—Wiring attachment.
1—Copper band turning attachment, Lamborn Co.
1 Banding press.
1—Base plate machine.
1 Hydraulic pump, accumulator, 150 ton press, and two testing presses.
5—Sets Canadian Fairbanks-Morse balance scales, 100 lb. with weights.
5—No. 3 Cowan elevating trucks.
1—8" x 12" Corliss inlet Class "D" Standard Cross Compound Belt-driven Air Compressor.

Also bake oven with 8 steel crates, varnish tank pump and stand, cleaning cradles, bench vises, painting machine and rack for 400 shells, etc.

SPECIAL SHELL MACHINES AND CONVEYOR

# Manufacturing the 75 mm. High Explosive Shell

By J. H. Rodgers * Part II.

### First Government Inspection

As the machining of the interior has now been completed, the shells are given their first inspection by Government inspectors. It might be stated that at each machining operation each shell receives a thorough examination from shop inspectors to eliminate the possibility of defective shells passing on to succeeding operations, a possibility that at all times must be guarded against. The system adopted in this plant has kept the percentage of rejected shells down to a very low figure. In the title cut is shown a view of the shop, giving a clear view of a row of special intermediate turning and facing machines, from which the shells are taken for their first Government inspection. This view is typical of all sections of the shop where the equipment is very compact, but not such as would lead to congestion or confusion.

The conveyers that carry the work from the various machines to the Government inspection bench are shown in centre of the illustration adjoining the side windows, that provide ample light for examination of the finished portions. It will be noticed that small elevated platforms are located at intervals along the top of the conveyer at a suitable height to allow the shells to pass freely beneath. At this point the shells are given a rigid shop inspection, and if passed are placed on the wooden carriages secured to the travelling chain of the conveyer that carries them to the Government inspection bench located at one end of the room shown. Just previous to passing on to the inspection table the shells pass underneath a Durant counter, where they are automatically counted. The inspection at this stage is very rigid, but owing to the care that is exercised by the shop inspectors the number of shells that are rejected by the inspectors is very small. However, as some slightly defective shells occasionally do get past the shop examiners, means have been provided for maintaining a check upon the shells that are rejected and those that are forwarded on to the next department. This is explained in another section of this article.

After passing the bore inspection, the shells are transferred to the floor above, where the nosing is performed. The method adopted for taking these shells to the second storey is illustrated in Fig. 10. Having passed inspection, the shells roll down a slight incline into a pocket in the conveyer framework, from which they are picked up by elevator forks located about every two feet on the elevating chain. As the elevator forks pick up the shell they pass a lever that extends through the screen at the front of the elevator. The lever is fulcrumed on a small shaft, the outer end of which carries the operating lever, by means of which the counter is operated. The appliance is so arranged that the lever is only tripped when a shell is in the conveyer. The counter on either side of the inspection table keeps an accurate check on all shells. These conveyers were installed by A. M. Ellicott, of Montreal, and the counters by the Durant Manufacturing Co., of Milwaukee, Wis.

### Heat Treating Department

From the elevating conveyer the shells pass into the heat treating department, where the nose is swedged in and the shells hardened and drawn. A partial view of this room is shown in Fig. 11. Three 10-hole Mechanical Enginering Co. furnaces are installed for the heating of the nose preparatory to closing in the open end. The shells are heated to about a white heat for a distance of about 2¼ inches back from the open end, the front of the furnace being made with a water-cooled portion made from welded steel plate. It is necessary to exercise considerable caution in the heating of the shell, as it is very important that superficial heating, overheating, or burning of the metal should be avoided. These furnaces have a heating capacity of about 120 shells per hour and are placed on either side of the nosing presses. The presses used are two No. 730½ Brown Boggs straight side geared, each being capable of handling 300 shells per hour. The arrangement of the presses and furnaces is such that continuous operation is obtained, the middle furnace acting as an auxiliary for either press. Special care is taken that no local chilling develops after the bottling process, as such would affect the machining operations.

One of the difficulties that has often been experienced in the closing in operation has been the number of shells that have not been bottled evenly owing to the shell not being set perfectly central when the operation was performed. In order to overcome this objection this firm adopted a special form of base plate to receive the shell when closing the nose. A sketch of this is shown in Fig. 12; the bed of the fixture is secured in a central position on the bolster of the press, and in the upper portion is contained a tapered bush D, that in turn rests upon another bush B, in the bottom of which are four compression springs C. The action of these springs keeps the centring bush in a raised position, so that when the shell is placed in and the press put in motion the shell is forced downwards,

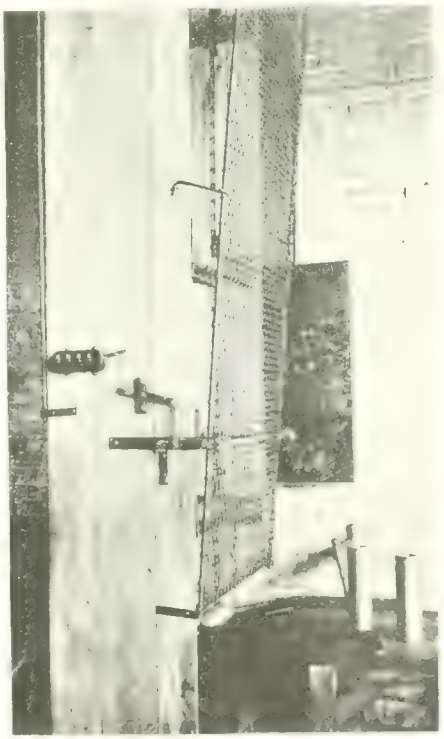

FIG. 10. ELEVATING CONVEYOR AND AUTOMATIC COUNTER

*Associate Editor CANADIAN MACHINERY.

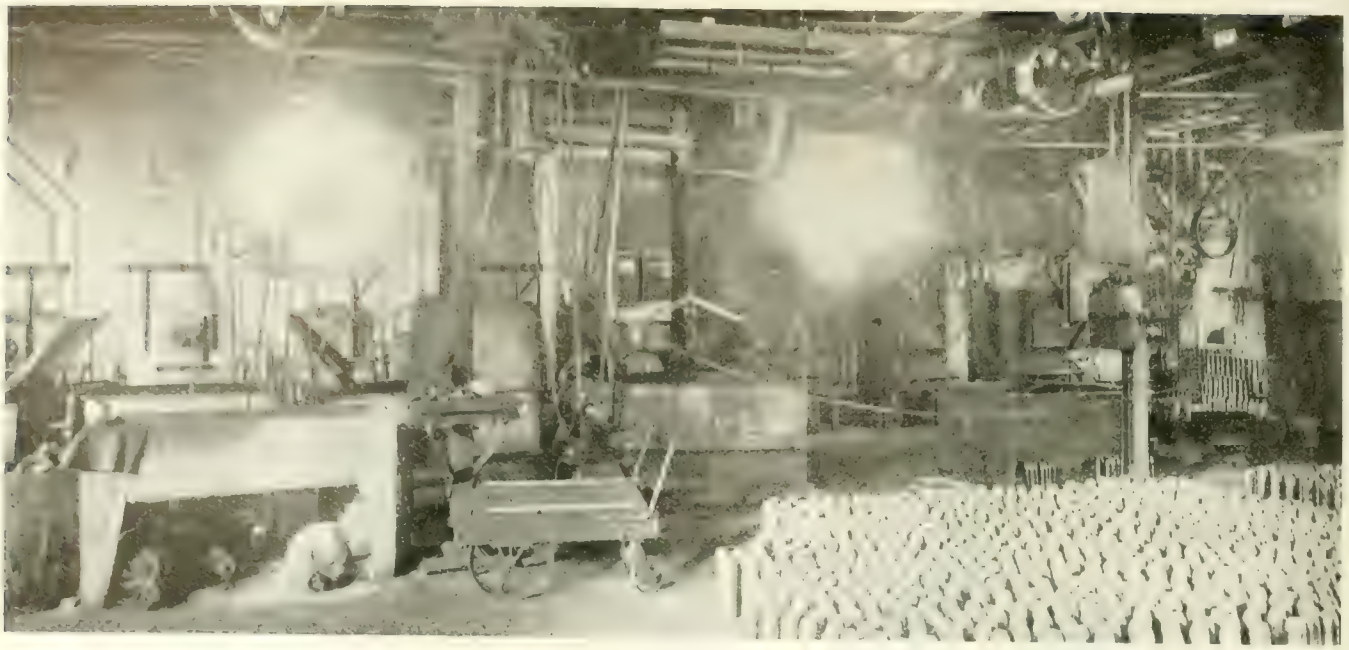

FIG. 11—SECTION OF HEAT TREATING DEPARTMENT SHOWING DOMINION BRIDGE FURNACES

but in perfect alignment until the base rests upon the thrust block E. Two clamps F are placed on either side to prevent the bush from coming out of the die. This appliance has practically eliminated defective shells as a result of faulty nosing.

After the bottling of the nose the shells are uniformly heated all over in

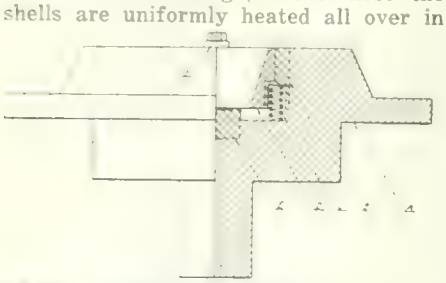

FIG. 12 ASSEMBLED PLATE FOR NOSE SWEDGING OPERATION.

small chambered gas-fired furnaces. Four Mechanical Engineering and nine Dominion Bridge furnaces are installed for this operation, these furnaces also being utilized for the drawing process. The shells are heated to a temperature of between 1,450 and 1,500 deg. F., and then quenched in a bath of oil. Slow heating is essential to even penetration of the heat, and in no instance is the heating of the shells either for quenching or drawing carried on in a hurried manner. Furnaces are not overcrowded with shells, so that the gases have a free circulation to all parts of the fire chamber. A network tray is kept in the bottom of each cooling tank, so that when the shells are raised from the bath they are allowed to drain freely. They are then placed on inclined rests, where further draining takes place, after which they are again placed in the furnaces and drawn to the desired temper, which is attained when the shells have been heated to about 1,150 degs. F. Both the quenching oil and the cooling water are kept in constant circulation by means of circulating pumps located on the ceiling of the hardening room. The total output from the heat treating department averages about 400 shells per hour. When the shells have thoroughly cooled they are subjected to the Brinell pressure test.

### Hardness Test

Following the heat treating operations the shells are taken to the Brinell testing machines, two being installed. After a spot has been flattened, by grinding, on either side of the shell, it is placed on the anvil of the machine, which has been so adjusted that the pressure will always come in a radial line with the axis of the shell. The diameter of the ball that makes the indentation is .3937 inches (10 mm.), and frequent checking is required to see that constant application has not affected its accuracy. The general practice is a 15-second duration under a pressure of 6,600 lbs., which should give a reading under the microscope of between 3.8 and 4.1 mm. As slight variation in the dimensions of the indent may arise from unequal length of time of applied pressure, it is desirable to check the period of time accurately.

### Hydraulic Test

Before the copper bands are pressed on about 10 per cent. of the shells are subjected to an internal hydraulic test. This test serves to detect by excessive expansion any material or physical properties below specifications, and by leakage, defective and porous material, as well as heat cracks resulting from improper heat treatment. The permanent expansion of any shell in excess of 2/3 of the limit prescribed for rejection will act as a basis for rejection.

Careful measurement of the shell is made before the pressure is applied at a point about ½-in. below the bourrelet, and during the fifteen seconds that the shell is subjected to the pressure it is closely examined for physical defects. When the pressure has been removed the shell is again measured and, if there is a permanent set of more than .001 per inch of the calibre, the shell is rejected and

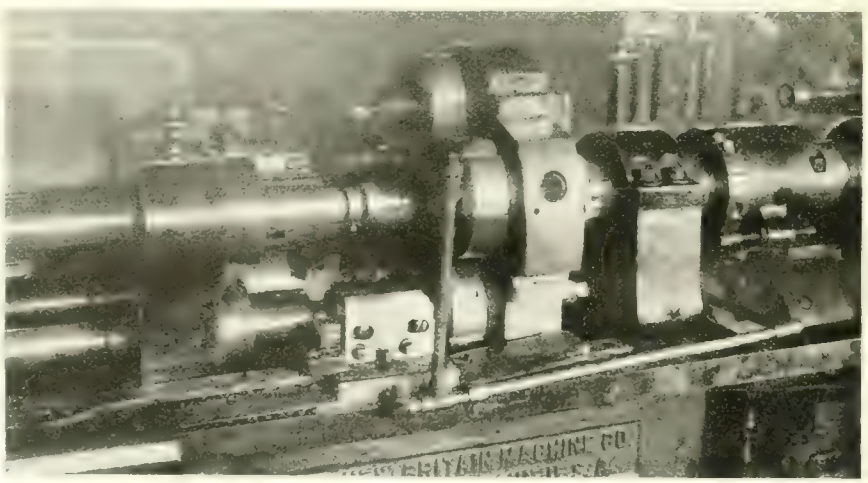

FIG. 13 NEW BRITAIN AUTOMATIC ADAPTED FOR NOSE OPERATION.

stamped by an inspector so as to make it impossible for the same to be used as a service projectile.

### Ringing Test

In addition to the above tests, a ringing test is given to all shells. The shells are supported in a suitable manner to prevent deadening the sound when the shell is struck with a light hand hammer. The sound must be a clear continuous note, and if otherwise the shell is liable to be rejected. This test follows the hydraulic test and precedes the copper banding.

### Machining the Nose

Previous to the machining of the nose bore the face is roughed off in four special facing machines. The boring, tapping and finish-facing is at present performed in four New Britain automatics, a view of this operation being shown in Fig. 13. In this operation the nose is rough bored, recessed, reamed and faced, and tapped with a solid tap, reverse motion being used for its extraction. A sketch of the fixture applied to the turret of the machine is illustrated in Fig. 14. The broken portion A is a section of the head, to the front of which is secured the piece B. The collet jaws C, three in number, have a total length of 5¾ in., and are relieved in the centre so that the pressure comes only on either end for a length of one inch; these jaws are kept in an expanded position by the action of the two ring springs shown. The pressure at the inner end is obtained by the tapered bush D, the outer end by means of the bush E acted upon by the operating chuck ring F. The U-shaped strap G is secured to the back of the head and through the centre is located the screw H, that can be accurately adjusted to the desired position. While satisfactory performance is obtained from this method, it is the purpose of the firm to replace these machines by others specially designed by the plant engineers for this specific operation.

Owing to the heavy work on the initial tapping of the nose and the great tendency of the taps to wear it is necessary that the threads be hand-tapped to insure bringing the same to correct shape and dimensions. The sizing taps are so designed that after they have become too worn for finish tapping they can be utilized for preliminary tapping.

The next operation—that of finishing the nose profile—is accomplished on the special machines designed for rough and finish turning. The intermediate turning, however, eliminates the necessity of turning the body at this time and, therefore, the machines are adapted for finishing the nose profile only. A plan view of the machine is shown in Fig. 15; a nose plug is used for driving the shell and the base end is placed in the ball bearing chuck A, the revolving portion of which is fitted on the shank of the spindle B, the thrust bearing being shown at C. Lateral movement of the spindle is obtained by means of the rod D and the lever E. The reaction of the spring H maintains a constant forward thrust upon the base of the shell. The cutting tool I made of ½-in. Stellite, is held in a special holder and adjusted to position by the screw J. The bracket K that is secured to the top of the cross slide carries the forked block L, in which the forming roller M is located. The generating cam N is bolted to the cast iron beam O; that is in turn supported in position on the two brackets P and P, extending out from the headstock and the tailstock. This method provides additional rigidity to the machine construction. Accurate adjustment of the cam position is obtained by means of the two screws, Q and Q¹. A small block S is placed in the bar O so that lateral adjustment of the cam plate can be made with the screw R. The roller is kept in contact with the cam by the screw T. Facility is provided at the back of the machine saddle for keeping the cross slide in the desired position.

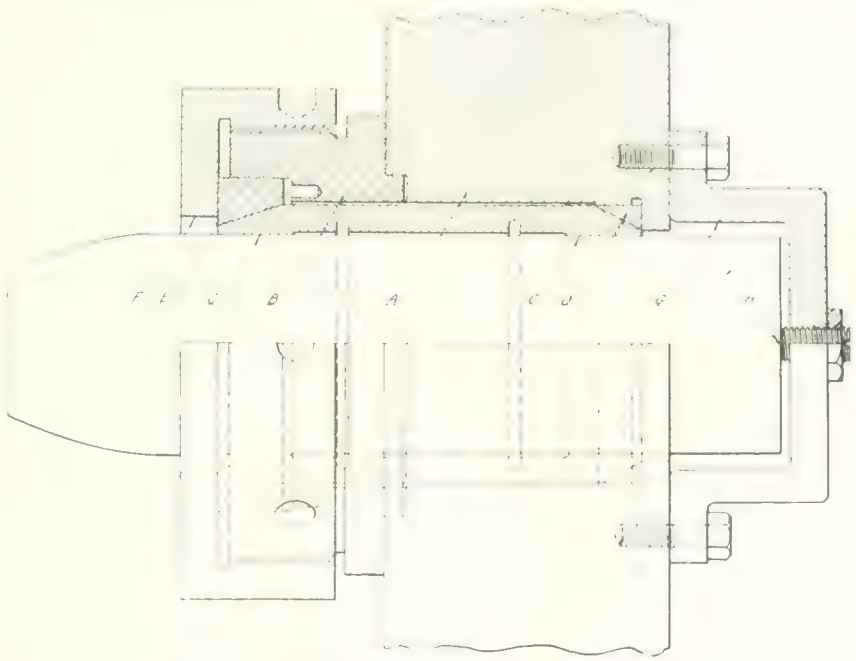

FIG. 14 CHUCKING DEVICE ON THE NEW BRITAIN.

### Grinding the Outer Diameters

Twelve Ford Smith grinders are installed for the grinding of the parallel portion of the body above the copper band, and also the bourrelet. The final mean dimensions at this point is 2.925 in. for the main portion and 2.96 in. on the bourrelet, the tolerance being respectively .01 in. and .02 in. A view of some of these machines is illustrated in Fig.

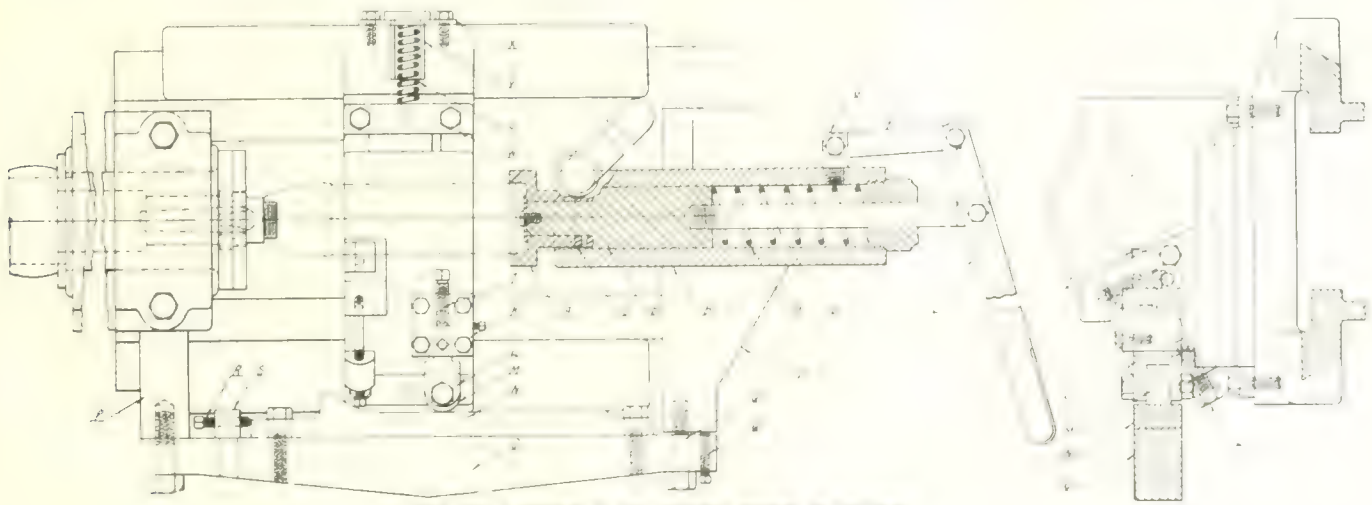

FIG. 15 ASSEMBLY OF FINISH TURN MACHINE

[illegible] Duplex screw pulls another of the [illegible] for carrying the shells to the base grinding machines. A bench is located between each machine for the purpose of removing the shells and preparing them for the grinding operation. Nose plugs are used for driving the shells and, like the nose turning, the base is supported in a ball-bearing chuck. All departments are well lighted in the day-time, and at night are lighted by high-powdered drop nitro-tungsten lamps. Floor space is utilized entirely for production purposes, and as far as possible the motors are located on the ceiling, as well as pumps and other shop accessories.

Grinding the base diameter is performed in eight Ford Smith machines, the dimensions after grinding being 2.925 in. The output from the body grinding machines is approximately 35 per hour, while the capacity of each of the base grinding machines is about 50 per hour.

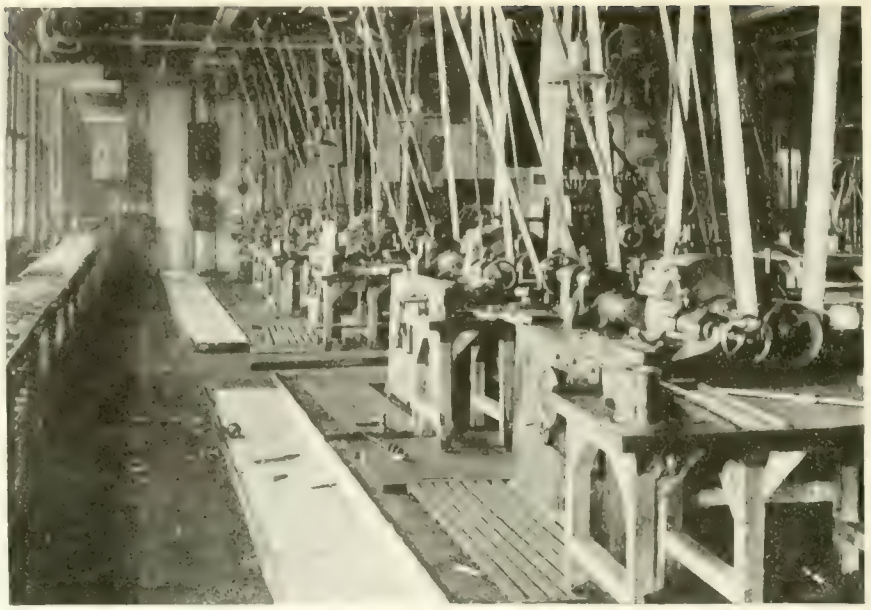

FIG. 16 GRINDING BODIES OF 75 MM. SHELLS ON FORD SMITH GRINDERS. HORIZONTAL CONVEYOR ON EXTREME LEFT.

### Groove, Knurl and Chamfer

After being ground on the diameter, the base is buffed to insure that there are no defects in the metal. For the grooving and knurling operation five Lymburner and seven Stetcher machines are used. The method of machining on these machines differs slightly, although the results obtained are practically identical.

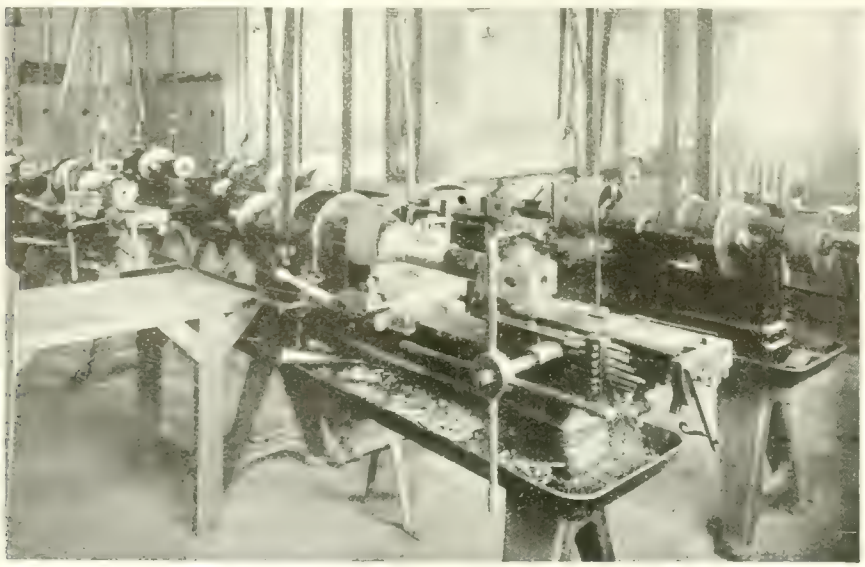

FIG. 17 FOUR STETCHER MACHINES ON THE GROOVING AND KNURLING OPERATION

Four of the Stetcher machines are illustrated in Fig. 17. On these machines the tool holders are located on the cross slide of the machine, the grooving performed at the rear and the knurling by the tool at the front that is forced under the shell. Both operations are accomplished by the movement of the handle shown at the front of the cross slide. The grooving tool is of the milled type and is located in a vertical position, a special clamping arrangement being provided for taking care of the regrinding of the tool.

The attachment adopted for use on the Lymburner machines is illustrated in Fig. 18. The design of this appliance is very interesting and likewise effective. On the front of the headstock two studs, A and B, are fitted; the left-hand one carries the piece C that supports the grooving tool D, which is clamped in position by means of the cap screw E, the vertical adjustment being obtained by the long screw F passing through the lug G on the piece C. The gauging roller H that governs the depth of cut is supported in the small bracket I and adjusted to position by means of the screw J. The back lever K carries the knurling roll L. Lower down in the headstock is secured the stud M on which are two eccentrics, these being keyed to hand levers for operating the respective tools, the eccentrics being connected to the two arms C and K by the adjustable links N and O. On the Stetcher machines the shells are held by the base end in pneumatic chucks, the nose end being supported in special ball-bearing chucks. On the Lymburner machines the shells are held by the body in air-operated chucks.

At the extreme base and also at the back of the groove the edges are chamfered slightly, as shown on the operation sheet. Three machines are used on this operation, and each has a capacity of about 150 per hour.

### Grooving the Base

The machines used for this operation are of Lymburner type fitted with special chuck for holding the shells. In these chucks the shells are placed in from the side, the chuck being composed of two arms extending out from the face plate of the machine. Integral with the two protruding arms is a ring that runs in a steady head. When the shells are inserted they are forced forward by the action of an air-operated ram, the cylin-

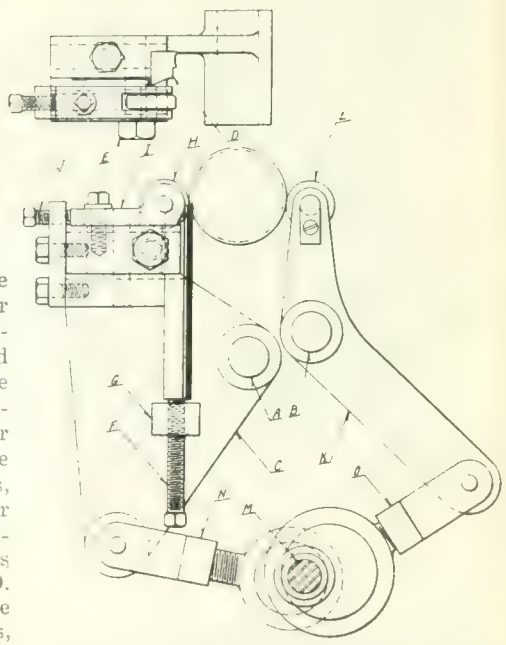

FIG. 18 GROOVING AND KNURLING ATTACHMENT.

der being located at the rear of the machine spindle. The grooving of the base is accomplished by a special attachment, the tools being operated by hand levers. A small V-shaped groove is first put in and then the outer edge is undercut by an angle tool. Six machines are used on this operation, each with a capacity of 65 per hour.

The machining of the shells has now practically been completed, so that after washing the shells in an oakite solution they are ready for the second government inspection. From the washing process the shells are elevated to the floor above for the final operations. As the shells come from the elevating conveyer they receive a light shop inspection, and are then run down a slight incline to the second government inspection table, where they are subjected to a close ex-

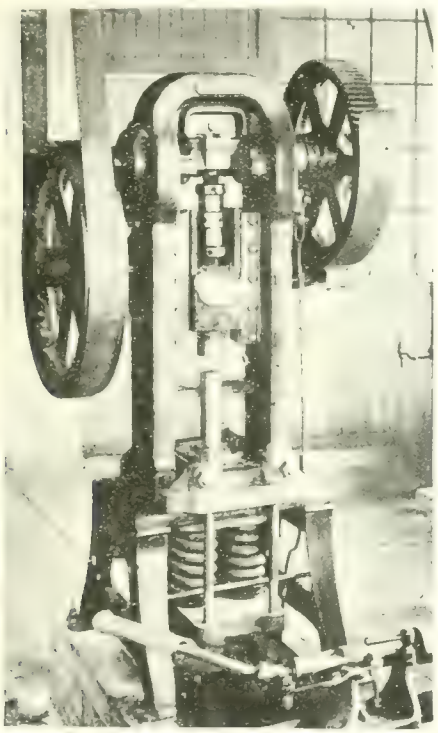

FIG. 18. APPLYING BASE-PLATE ON BROWN BOGGS PRESS

amination for visible defects and also for the gauging of the body and groove dimensions.

The band operations are very similar to those on other shells and require little mention, the machines installed being capable of finishing approximately 8,000 shells in the 24 hours. After milling the groove in the nose, the interior of the shell is sand blasted.

A feature that differs considerably from the practice used on other shells is the method that is used in protecting the shell charge from the propelling gases. The plate that is used in this type of shell is made of sheet steel, and is placed in position by the action of excessive pressure, followed by the rolling of the surrounding metal over the edge of the plate. A view of one of these machines is illustrated in Fig. 19. These presses are Brown Boggs No. 320 straight side type, and are fitted with special dies for pressing the plate into the recess prepared for it. Owing to the slight variation that is possible in the length of the shell it has been necessary to provide means to overcome this. Below the bed of the press is constructed a cushion arrangement that requires about 30 tons to compress the four heavy coil springs. Two presses are supplied to take care of this operation, and each has a capacity of about 200 shells per hour.

A small speed lathe has been adapted to perform the rolling process. The revolving head is fitted with a head that carries three small rollers that roll the metal about the plate when the shell is held in position and pressure exerted from the tailstock. After hand-sizing, the shells are varnished on the interior by means of the spraying process, following which they are taken to the final Government inspection room.

(Concluded)

## ORE, PIG IRON AND STEEL STATISTICS FOR 1917

THE total shipments of iron ores from Canadian mines during 1917 were 192,210 gross tons, valued at $758,261 as compared with shipments of 245,730 tons valued at $715,107 in 1916. The 1917 shipments included 176,890 tons from mines in Ontario and 15,310 tons from mines in Quebec, and of the latter amount a considerable tonnage was from old stock piles. The ores comprised 176,450 tons of hematite and roasted hematite and siderite, 11,300 tons of magnetite and 4,440 tons of titaniferous ores. The principal operating properties were the Helen and Magpie mines of the Algoma Steel Corporation, all of the ores mined being first roasted before shipment. Mine operators reported 151,080 tons of ore exported to the United States and 41,120 tons shipped to Canadian furnaces. The Customs Department shows exports of iron ores 146,450 tons, valued at $660,673 and imports amounting to 2,010,490 tons valued at $5,124,889. The total quantity of iron ore charged to blast furnaces in 1917 was 1,943,430 tons, of which 82,210 was of domestic origin and 1,861,220 tons imported. The imported ore included 780,600 tons of Newfoundland ore and 1,080,610 tons of Lake ore. Shipments of iron ore from Wabana mines, Newfoundland, in 1917 by the two Canadian companies operating there were 788,820 gross tons, as against 903,760 tons in 1916, all of which went to Sydney and North Sydney in Cape Breton.

### Pig Iron

The production of pig iron in blast furnaces during 1917 was supplemented by a small production of high-grade low-phosphorus pig-iron in electric furnaces made from shell turnings and other steel scrap. The total production from both sources (not including the output of spiegeleisen, or other ferroalloys) was approximately 1,171,789 net tons (1,046,240 gross), final returns not yet having been received from all manufacturers of electric pig iron. Of the total 1,156,789 tons were produced in blast furnaces and the remainder in electric furnaces. In 1916 the production, all made in blast furnaces, was 1,169,257 net tons (1,043,979 gross tons). The small increase in pig iron production in 1917 was therefore due entirely to the electric furnace production, there having been an actual falling off in the blast furnace output. The production in Nova Scotia in 1917 was 472,147 tons as against 470,055 tons in 1916. In Ontario the production by blast furnaces in 1917 was 691,632 tons as against 699,202 tons in 1916. By grades the 1917 production included: Basic, 14,092 tons; Bessemer, 961,656 tons; foundry and malleable, etc., 181,041 tons; electric furnace pig (subject to revision), 15,000 tons. The total 1916 production included: Basic, 953,627 tons; Bessemer, 31,388 tons; foundry and malleable, etc., 184,242 tons. The blast furnace plants operated were the same as in the previous year, viz.: The Dominion Iron & Steel Co., Sydney, N.S.; the Nova Scotia Steel & Coal Co., at North Sydney, N.S.; the Standard Iron Co., Deseronto, Ont.; the Steel Company of Canada, Hamilton, Ont.; the Canadian Furnace Co., Port Colborne, Ont., and the Algoma Steel Corporation, Sault Ste. Marie, Ont. Pig iron was made in electric furnaces by the Canada Cement Co., Ltd., Montreal, Que.; Frazer, Brace & Co., Shawinigan Falls, Que.; British Forgings, Ltd., Toronto, Ont.; Electric Foundries, Ltd., Orillia, Ont.; and Turnbull Electro Metals, Ltd., St. Catharines, Ont. The total production in electric furnaces of pig iron, ferroalloys and steel ingots and castings was in 1917 about 99,000 net tons.

### Steel

The estimated production of steel ingots and direct steel castings in 1917, final returns for all operations not yet having been received, was 1,736,514 net tons (1,550,459 gross tons), of which 1,690,170 tons was ingots and 46,344 tons direct steel castings. The total production in 1916 was 1,428,249 tons, compared with which the 1917 production shows an increase of 308,265 tons, or 21.6 per cent. The total production of electric steel was probably not less than 50,000 tons as against 19,639 tons in 1916 and 5,625 tons in 1915. The exports of steel ingots or billets, ingots and blooms during the nine months ending December (such exports not being separately classified previous to April, 1917) were 41,558 tons, valued at $1,831,917. The record imports of iron and steel ingots and billets during the year was 20,429 tons, valued at $1,378,576. This item is also much lower than the United States trade record, which shows exports to Canada during eleven months ending December, 1917, of 143,209 gross tons (160,394 net tons) of billets, ingots and blooms of steel valued at $11,418,033.

A WHITE metal, which takes a brilliant polish and holds it on exposure to the atmosphere, is claimed to be possessed by an alloy of bismuth, mercury, tin, zinc and copper, recently patented.

BELT clamps having spring balances between the top two pair of clamps should be used for weighing the tension of the belt accurately, each time it is tightened. —Belts.

## GUARDING PLANER FEED GEARS

By D. H. M.

PLANER feed gears have never been regarded as especially dangerous. Inspectors have passed them by as being too small for their attention but nevertheless a man can get a bad pinch in them, if nothing more. A great many planers have both feed rods carried out at the side, as is the one in the photo, and on the squared ends the hand feed and the power feed unit is used at will. The power feed unit is slipped on either rod according as the cross feed, or the vertical feed is wanted. The sector gear in the back drives the feed on either rod. It is customary for the planer hand to feed by hand up to the point where he has a correct setting and then he "clicks" in the power feed by tipping the latch at the outer side of the unit. In doing this, he is very apt to be bending over the work with his right hand back of him on the feed parts. He clicks on the feed while in this position, depending on his sense of feeling and his familiarity with the planer to guide him aright.

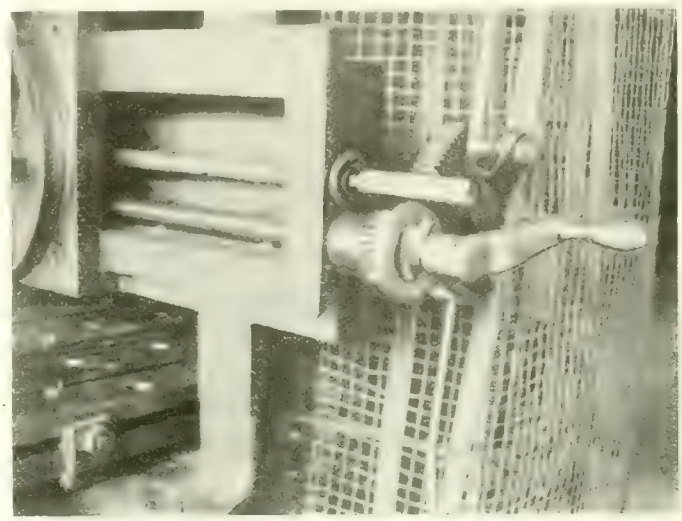
It is at this stage that some sort of a guide is a safeguard against getting pinched. The flange shown in the photo is an effectual guard for these gears. It is shrunk on the shoulder of the the unit and is as large as the clearance will allow. With it, it is impossible to get caught in the gears except by deliberate attempt, for it covers the meshing region and is large enough to keep the fingers away from danger no matter in what direction they may come in contact with the flange. And the latter is an integral part of the mechanism, no matter which feed is being used.

The consistency (?) of the factory laws in regard to guards is shown by the same photo. The driving belts were ordered entirely enclosed as shown, but the inspectors passed the gears as "all right." The belt guards would have been just as safe if they had enclosed only the pulleys, but no, they must be six feet from the floor; at which height they formed a fulcrum for the belts when they broke—as all planer belts do at times—and several men were badly scared when belts slapped them over the head. Without the guards, the belt simply dropped to the floor. It was necessary to carry the "guards" to the ceiling before the machines in that department could be really called safe.

## LITTLE KNOWN FACTS ABOUT GRINDING

By Howard W. Dunbar

WITH variable work speeds we are enabled to secure a wider range of wheel service than variable wheel revolutions could ever possibly give. We secure very satisfactory and nearly uniform results from wheels varying from 2,000 to 5,500 s. f. p. m. and a variation from true grade within practical wheel making limits. Therefore, the necessity for variable revolutions for the wheel, or very close accurate limits of speed and grade of the wheel, are unnecessary.



GUARDING PLANER FEED GEARS.

### Variable Work Speeds

Occasionally it becomes necessary, for obvious reasons, to provide a change in the wheel revolution, so that when a large wheel is worn down to a relatively small one we can bring the surface speed of the wheel back more nearly to the maximum limit; but the latest light on this subject leads us to believe that the most efficient wheel for standard cylindrical grinding is one in which the hole is of such a size that its surface speed will be approximately 4,000 feet when it is worn out, representing the low limit, and 6,000 feet when the wheel is new or full size, representing the high limit.

The normal speed is then selected so that the average life of the wheel gives the highest possible efficiency.

We are many times asked why we do not provide grinding machines with means for variable wheel spindle speed. The answer is very plain—the wide range of work speeds supplied accomplishes all that variable spindle speeds could ever accomplish and much more in a simpler way at less expense. The means necessary to provide a graduated change of speed for the wheel spindle must of necessity be more complicated and expensive than means to provide for change of speed in the work drive mechanism. Again, a given range of work speeds produces a wider range of effect than a much greater range of wheel spindle speed could possibly give. To illustrate: To obtain the same range of effect at variable wheel spindle speed as we obtain with work revolution, utilizing from 20 to 138 revolutions per minute, we would require a change in spindle speed from 169 revolutions per minute to 1,233 revolutions per minute, or a surface speed from 6,400 feet, the highest speed that is considered safe, to 890 surface feet per minute, this latter being so slow that the wheel would wear away rapidly and be useless if the grade was soft enough to be effective at 6,400 feet per minute.

### Maintain Uniform Conditions

When we have adjusted the work speed to obtain the best results great care should be exercised to maintain a constant revolution of the wheel with no slippage of belts, or momentary slowing up, due to lack of power. With irregular speed minute particles of material being ground adhere to the wheel face, which causes the wheel to cut less freely, with the result that the production is delayed and more power is required. It is not an uncommon thing to see a wheel under heavy cuts slacken in speed sometimes to one-half the normal, and frequently very nearly stop. The disadvantage of this is not clearly understood. Machines should not continue in operation with insufficient and irregular power. The quality and production of work suffers because constant power is not provided, if soft enough wheels are not used for the power available.

It seems wisest and most convenient to maintain the wheel spindle speed constant and make all variations to suit conditions by the adjustment of work speeds, which is much more convenient and effective.

We do not advocate variable revolutions for the wheel; we prefer to use variable speed for the work.—*Grits and Grinds.*

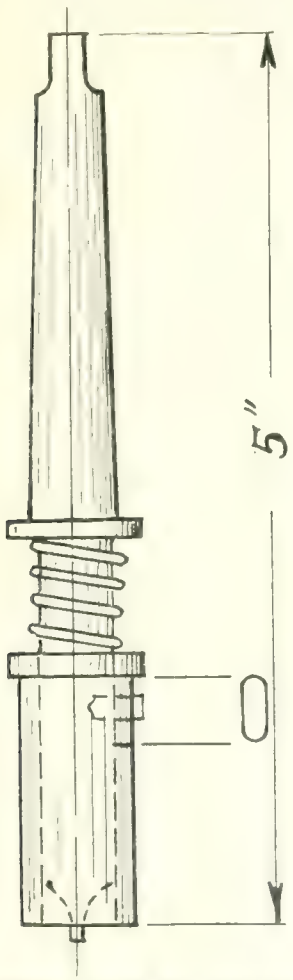
## AIR OPERATED SCREW-DRIVER

By G. M. Dick

IN the shipping of munitions, most of the covers are fastened on the boxes by means of wood screws. The operation of driving in the screw occupies quite a large percentage of the time taken to

pack a box, and also quite a little strength if done by hand.

A screw driver operated by compressed air has been used for some time past in a munition factory and has



SCREW DRIVER BIT FOR USE WITH AIR DRILL.

given good results. The accompanying drawing gives the details of this device which is used with the ordinary compressed air drill. A bushing on the stem acts as a guide on the head of the screw.

## AN OIL FILTER

By John Port

SO many oil filters have been described that I hesitate to describe another. The one here shown has proved very satisfactory in operation and has many advantages over a number of home-made filters in operation to-day.

The tanks made from galvanized iron can be obtained from any tinsmith for a few dollars and the taps and pipes can be installed by any operating engineer. The filter can be made any size according to the size of the plant. So far as cleaning dynamo or engine oil is concerned the filter will work like a charm just as shown.

If it is desired to filter lard oil, cylinder oil or any other heavy oil it will be necessary to instal a steam pipe in the compartment B, below the waste, to keep the oil thinned.

One feature should be noted in the design of this filter, all pipe-work in the various sections should preferably be of the same size and ½ in. galvanized iron pipe has been found satisfactory in this respect.

The oil to be filtered is put into tank A, passes to the bottom of tank B, up through the waste and into tank C, and from there through the water to tank D, where it passes out of the tap E.

There is a coupling and a large iron washer at H; this holds up the perforated iron screen. Tank A acts as a cover for B and lifts out, taking the screen pipe and waste from B when cleaning is required. By removing the locknut at K the pipe can be removed and the tank C lifted out for cleaning tank D.

When cleaning out the tanks any oil therein should be saved and refiltered.

It is quite safe to use oil filtered with this machine as very little dirt will get past tanks A and B. These two last-named tanks will require cleaning more frequently than C and D.

This filter will do as good work as many manufactured at four times its cost.

## THE USE OF FUEL UNDER BOILERS

By Mark Meredith.

A MATTER of the utmost current interest to those responsible for the efficient conduct of power plants is that of boiler fuel, which is probably the heaviest item of expenditure in the cost of production. Assuming that ordinary bituminous coal is the fuel used for this purpose, the various causes of waste incidental to its use, the methods that must be adopted, and the essential conditions to be maintained in order to burn efficiently the various solid and volatile constituents of raw bituminous coal are too well known to require comment.

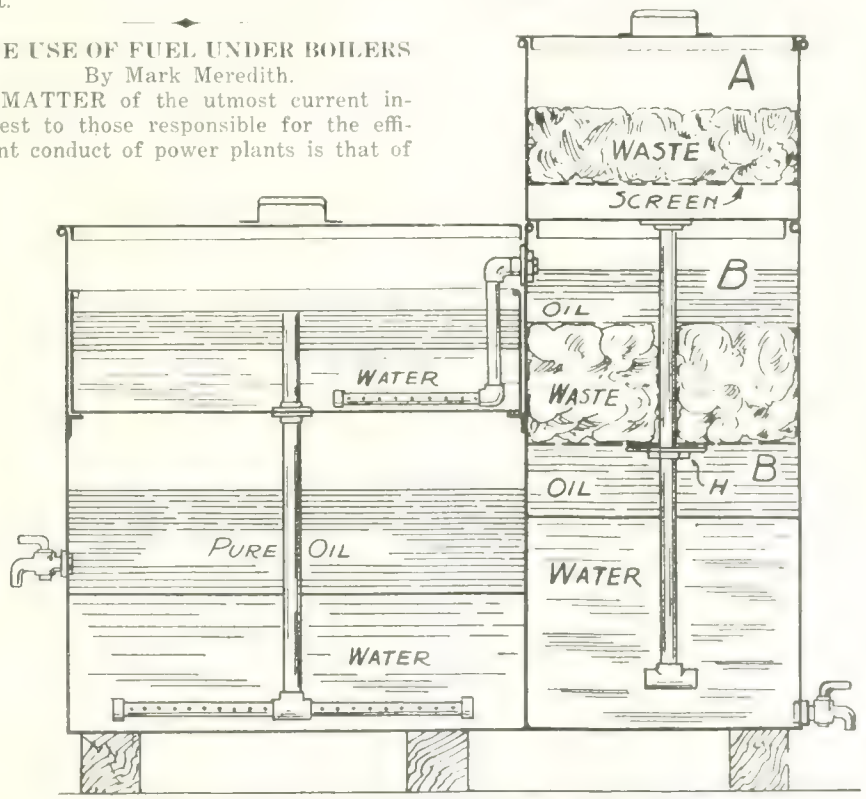
Compliance with these conditions in practice is not easy. The stoker usually has other important duties to perform in addition to firing the boiler, and to supply him with a fuel which has been shown to require expert attention and constantly varying amounts of air for its efficient combustion is simply to invite unnecessary waste. In order to avoid risk of prosecution for causing black smoke the stoker will leave the furnace door partly open after firing fresh coal, and, while attending to other duties, the open door is forgotten. Very considerable waste is often thus caused by the continuous inrush of cold air to the furnace.

Some further explanation as to why it should be necessary to maintain the conditions indicated in order to obtain, without undue emission of smoke, anything like the full steaming capacity of a boiler when using bituminous coal may be of interest. It is simply because this class of coal contains anything up to 30 per cent. by weight of smoke producing volatile combustible matter, the remander being chiefly fixed carbon and ash.

The volatile matter needs for its complete combustion about double the amount of air that is required for the fixed carbon, which is smokeless; and yet both volatile and fixed constituents must be burned simultaneously in the same furnace.

To so regulate the air supply to the furnace, that each constituent obtains only the necessary amount of oxygen for its combustion and no more, would, therefore, appear to be a physical impossibility, and is certainly an achievement beyond the ability of an ordinary stoker.

The obvious thing to do in order to avoid this serious source of waste is to obtain suitable fuel containing a minimum of volatile matter. This is procurable only in the form of smokeless gas coal. The best grades of Welsh smokeless coal contain as little as 5 per cent. to 10 per cent. volatile matter, and are



SECTION THROUGH FILTER SHOWING ARRANGEMENT.

for use in the Royal Navy; but to many the fancy prices charged for it must be prohibitive.

chemical composition as the best quality anthracite, but it is infinitely more easy to burn in steam boilers, and contains only from 1 per cent. to 5 per cent. volatile matter. Coke is now abundantly procurable in most British towns and cities at about half the cost of the latter fuel. Where restrictions as to smoke emission from boiler chimneys are severe gas coke is now extensively used for steam raising on hand-fired and mechanically-stoked boilers of all types; but so strong is the adherence to old customs that it is within knowledge that many steam users are still unnecessarily using inefficient bituminous coal, or the more expensive smokeless Welsh, thus unduly monopolizing railway transport, while fuel better suited to their requirements is produced practically at their doors.

Gas coke has the advantage of being a most efficient manufactured solid fuel. It requires a minimum excess of air and little or no skilled attention in order to secure practically complete combustion, while no secondary air admission over the fire is either necessary or desirable. In official tests over 10 lbs. of water have been evaporated per pound of coke in ordinary Cornish boilers. Where the boiler capacity is limited or inadequate, broken coke, about walnut size, must be used in order to obtain the maximum steam output with the best economical results. In other cases, where the natural draught is insufficient, it may be necessary to fit steam-jet blowers under the fires; these are simple, readily applied and inexpensive, and they increase both the furnace efficiency and the capacity of the boilers.

A factor of prime importance, bearing upon boiler furnace efficiency, is the item of excess air. Boiler furnace efficiency is gauged by the percentage of carbon dioxide ($CO_2$) present in the waste gases. In burning bituminous coal 16 per cent. $CO_2$ is the maximum attainable, and 8 per cent. $CO_2$ (which corresponds to 130 per cent. excess of air) is good average practice. With coke fuel, 20 per cent. $CO_2$ the highest possible, is not only obtainable, but is often approached in actual practice, 16 per cent. $CO_2$ (30 per cent. excess air) being a common result for steady periods of working.

## BALL-BEARING APPLICATION TO VERTICAL MOTOR

THE largest motor-driven pumping unit at the main sewage plant of the City of Toronto, on Morley Avenue, is equipped with a combined radial and thrust ball-bearing unit shown in section in the above illustration.

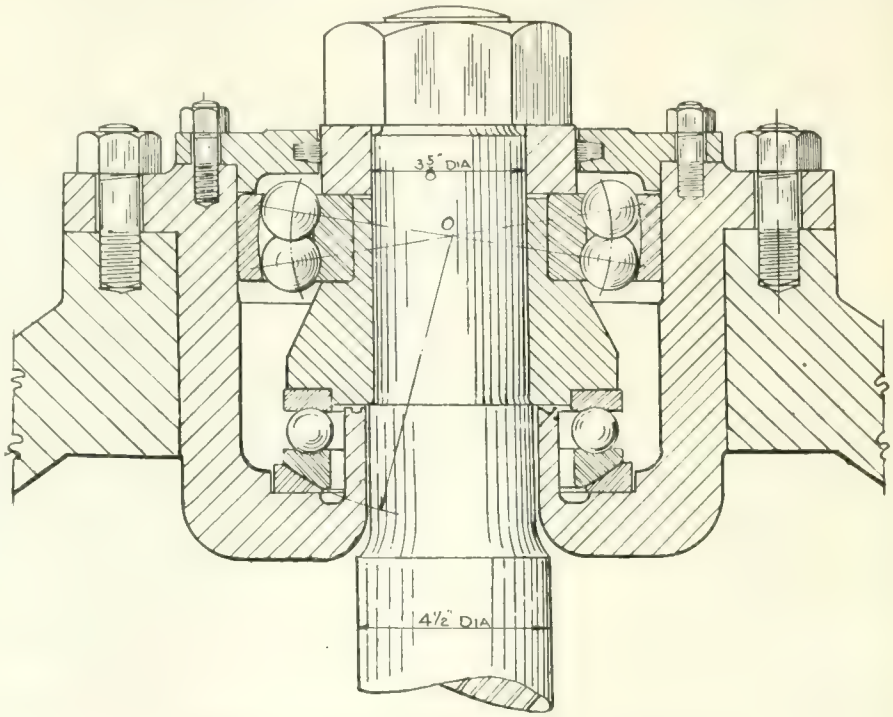
It will be seen that the shaft and bearings are self-aligning about the centre of the radial bearing at O. The complete bearing, while holding the shaft in its lateral and vertical position to fine limits, relieves the shaft and top bearings of binding strains set up by inaccurate erection.

The motor, which is of 200 h.p., has a speed of about 200 r.p.m. and a shaft of 4½ in. diameter. The thrust bearing has a vertical load capacity of 10,000 pounds at this speed, and the radial bearing a capacity of 15,000 pounds. Provision is made to protect the bearings from the intrusion of dirt, and also against the leakage of grease by the use of felt washers, thus avoiding the possibility of oil-soaked windings.

The use of ball bearings for this work has several advantages such as power saving, few bearing troubles, economy and cleanliness in operation and ease in starting.

Starting troubles form one of the greatest sources of annoyance with a vertical motor equipped with plain bearings, the film of oil separating the bearing surfaces being broken when the motor is at rest, permitting the bearing surfaces to come together. In starting, before the oil can be circulated and the oil film re-established, the metallic friction may flake or start some imperfection in the bearing. Ball bearings roll (not rub) and, not being dependent upon the immediate circulation of the lubricant, are not subject to this difficulty.

This particular application was of a special design installed by the S. K. F. Co., of Toronto.



BALL BEARING APPLICATION TO LARGE VERTICAL MOTOR

## UNITED STATES MACHINERY AND TOOL BUILDERS TO HOLD WAR CONVENTION

THE enormous problem of manufacturing and supplying machinery and tools sufficient for the carrying out of the Government program for the production of ships, shells, guns and aircraft will be the subject considered at the great "War Convention" of the machinery, tool and supply industry of the country to be held in Cleveland the week of May 13.

One thousand men who are bearing the brunt of the unprecedented demand for machinery will gather from all parts of the country to lay out a plan, with the aid of Government officials, to keep the great munition program going at top speed. The big war convention will be a joint meeting of four great national associations, the American Supply & Machinery Manufacturers' Association, the National Supply & Machinery Dealers' Association, the Southern Supply & Machinery Dealers' Association and the National Pipe & Supplies Association, which will meet together in order to co-ordinate their efforts toward one goal, "More Ships, More Shells."

"No industry has a greater responsibility at this moment than the machinery men," said H. W. Strong, president of the National Supply & Machinery Dealers' Association. "We must have men, but behind the men must be ships and munitions, and behind the ships and munitions, machinery—more machinery—still more machinery. We are in this fight to a finish. The Germans have convinced us that the only way out of the war is straight through, and the American machinery industry is ready to carry on to a knock-out."

The part played by drills in the game of war is shown by the computation that 70 drilled holes are required in every three-inch shrapnel shell, in every rifle 90, machine gun 350, torpedo 3466, war plane 4089, war truck 5946, war ambulance 1500, 3-inch field gun 1280, gun caisson 594 and anti-aircraft gun 1200.

"'Carry on' will be the watchword of the convention," said R. F. Valentine, president of the Manufacturers' Association.

INCREASING the temperature tends to increase the length of the belt and so to decrease the tension.—Belts.

# Worm Gearing: Principles of Design and Manufacture II*

By Francis J. Bostock

*For many years the manufacture of worm gears was conducted by means of empirical and more or less rule of thumb methods and as a consequence efficiencies were low and unsatisfactory. Improved methods of design and manufacture in recent years have effected such improvements that the worm gear is to-day one of the most efficient methods of power transmission. Considerable interest attaches to the description by the writer of the various machines and methods used in the production of worm gears.*

## Manufacture

IN ordinary machining one is dealing with plane or circular surfaces, but in worm gear one has to manufacture curved helical surfaces, which is, without doubt, a most difficult manufacturing operation to carry out. It will be readily understood that as an error of one-thousandth part of an inch prevents two like surfaces from touching, an error of only that amount will materially alter the contact bearing between the gears. The difficulty in eliminating that one-thousandth is enormous, especially when it is necessary to make several thousand gears absolutely interchangeable: therein all the curved surfaces have to be identical.

With your permission the author wishes to show you how such interchangeable curved surfaces are made, and in doing so he will be describing the methods and processes carried out by Messrs. David Brown & Sons (Hudd.), Limited, Huddersfield, with whom the author has pleasure in associating himself. The whole of the machines and appliances to be shown have been designed and built by the firm to enable them to produce large quantities of interchangeable work with rapidity and accuracy.

## Worm Milling

The worms are usually supplied solid with their shafts and are supported in their cases by two ball journal or plain bearings, placed on either side of the thread. In order to guarantee concentricity and uniformity of size a practice is made of grinding all worms on the outside diameters of the threads and journals before the cutting operation.

The worm-milling machine, illustrated in Fig. 7, consists essentially of three main castings—the bed, head and horizontal table. The bed is T-shaped, and provides ample bearing surface for the sliding table and head. This well-proportioned head slides at right angles to the work, is extremely rigid, and after being fed to the correct depth, measured by a micrometer, the worm is caused to travel spirally in front of the cutter, thus milling a thread space for each longitudinal travel of the table. The cutter spindle is carried in a swivelling cover, which enables it to be set at any angle to suit the spiral of the worm to be cut. A very special feature of this construction is the manner in which objectionable overhang, so common in other machines, has been overcome. This eliminates vibration during cutting.

The table is of unique design, being supported in an exceptionally long V-slide forming part of the bed, so arranged that all stresses and thrusts due to cutting are properly taken care of, and that it can smoothly traverse the bed, even under the heaviest of loads. It carries on the right-hand extremity a patent collet chuck and dividing head, whilst a self-centering roller steady can slide along its surface.

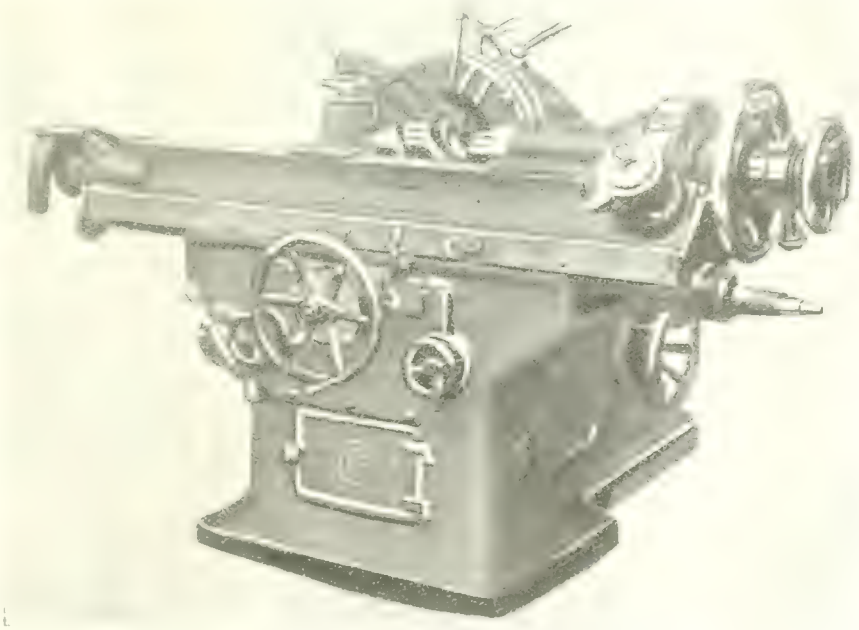


FIG. 7. WORM MILLING MACHINE.

The main drive is from a single pulley, which is provided with an internal friction clutch operated by a lever situated in front of the machine. After passing through a four-speed gear-box the drive separates, in one case passing through mitres to the cutter head and in the other case through a feed gear-box, automatic trip gear, and change gears to the lead screw; at the same time, by passing to the dividing worm and wheel, slowly rotating the work past the cutter at the requisite lead. As the drive is designed to pass through an index plate to the dividing worm, it renders it a simple matter to index the worm to the required number of threads.

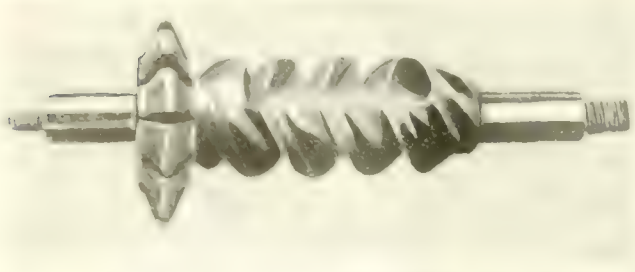
The worm is carried in the special collet chuck, which is made from hardened and ground high-tensile steel. The operating mechanism consists of an outer sleeve, which is conical at one end to receive the collets, the other end being screwed to suit a hand wheel and slotted to accommodate two toggle levers. An inner sleeve engages at one end with the collets, and is at the other end adjustable in its length by means of a screwed sleeve and a smaller hand wheel. This hand-wheel sleeve, which gives preliminary adjustment, is fitted with a hardened steel washer, against which the toggles bear, so that when the large hand wheel is screwed along its sleeve it causes the toggles to press against the washer, thence to the work, so gripping it with an immense increase in leverage. The operation of tightening or releasing the work requires but a few moments. The work being truly gripped at one end, is supported at the other end by means of a sliding adjustable self-centring roller steady, which enables it to be firmly held, at the same time giving entire freedom of rotation.

## Cutter Form Generation

The rotary worm cutter at first sight appears to be quite a straightforward matter, with its contour made to correspond with the space of the worm thread. Such, however, is far from being the case, as its actual contour is quite different from the thread space which it cuts in the worm blank, as can be readily observed in Fig. 8. This apparent paradox is caused by the interfer-

*A paper read before the Manchester (England) Association of Engineers. Part I. appeared April 11.

worm threads, and will be readily under-



SECTIONAL VIEW OF WORM TEETH SHOWING FORM CAUSED BY INTERFERENCE OF CUTTER TEETH WITH SIDES OF WORM THREAD.

thread space it would likewise have to be made spiral in shape, which would be an absurdity, for it would no longer revolve. As a rotary cutter must be made circular in shape, and as a circle and a spiral cannot coincide, it is obvious that the contour of the circular cutter cannot coincide with the thread space of the spiral worm.

It will be remembered that the base of the worm thread system is a straight line. In the system of cutter generation a straight-edged tool is set to an angle corresponding to the pressure angle of the worm to be cut, and is then made to traverse in a spiral path coresponding exactly with the spiral of the worm. Thus a generating tool is mounted in a worm-milling machine in the same position and manner as the worm which has to be cut, its straight edge accurately representing one side of the worm thread. When it has generated one side of a white metal blank it is indexed to the other side, thus forming the contour of the required cutter.

### Worm Inspection

The usual method of gauging gear teeth is by means of gear-tooth calipers, which, whilst being satisfactory for ordinary measuring purposes, are too slow and not sufficiently accurate for quantity production. All measuring devices should be quick in action and show a magnification of the error, thus enabling the smallest discrepancy to be made easily apparent. Instead of the gear-tooth calipers a bench instrument, like the one shown in Fig. 9, is used; two suitable bars are placed under the worm and a third is placed on the top, the worm is then rolled under a clock indicator, a reading of two-thousandths of an inch indicating an error of less than one half-thousandth in tooth thickness.

For testing the accuracy of the pressure angle a knife-edge protractor is placed along the side of the thread and the angle read to plus or minus a few minutes. This is carried out in a worm-gear testing machine, illustrated in Fig. 10, which has been designed to enable the various testing operations to be performed on both worms and wheels. These can be tested separately as individual pieces, or in combination when mounted together at the specified centre distance. The bed consists of two slides at right angles, one carrying a pair of adjustable centres and the various testing appliances, whilst the other slide carries an adjustable arbor adapter, which is controlled by a micrometer screw, enabling it to be set at any required distance from the other slide, so giving correct centres for the worm and wheel under test. This machine is most conveniently operated, as it can be worked from either side, thus allowing the operator to be in the most advantageous position to carry out all the necessary tests. Other instruments are used on it for testing concentricity and lead.

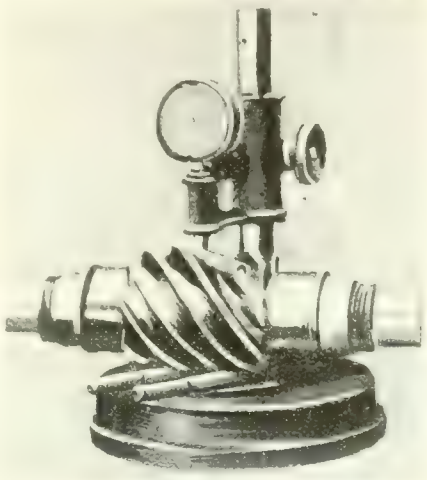


FIG. 9. METHOD OF GAUGING PITCH DIAMETER OF WORM.

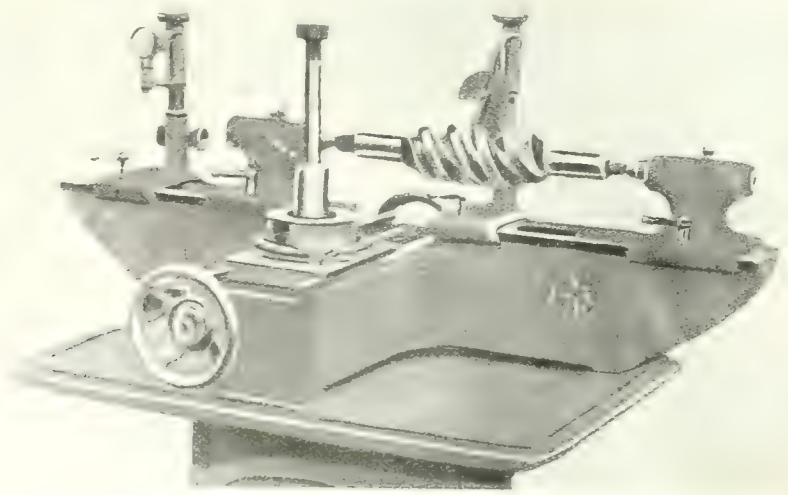

FIG. 10. MACHINE FOR TESTING ACCURACY OF PRESSURE ANGLE BY MEANS OF KNIFE-EDGE PROTRACTOR, GIVING RESULTS TO PLUS OR MINUS A FEW MINUTES.

The process of case-hardening worms is exactly the same as for other work, but although every precaution be taken, some little distortion is bound to occur. They therefore require straightening so that their pitch diameter runs true; for this purpose a clock indicator on a testing machine is used in conjunction with the straightening press, and by means of a ball placed in the space this operation can be accurately and quickly performed.

(To be continued.)

## STANDARDS AND STANDARDS

IN a series of "Special Articles," the *Board of Trade Journal*, under its new management, is giving its readers useful summaries of the reports of Departmental Committees. In the issue for February 7th the report on Standardization is dealt with. We are told that "the principle of standardization is approved by the committees, and their reports show that effective standardization cannot be achieved without the closest cooperation amongst manufacturers." No other finding was to be expected; standardization is the catch-word of the day. It used to be "specialization," which is a better thing, for it provides for that very flexibility which standardization has, inevitably, a tendency to destroy. A firm may specialize in a particular kind of machine tools and yet introduce frequent developments and improvements; if it standardizes a particular pattern it will hesitate to make changes. The fact is that standardization is a rather misused word; it is employed too indiscriminately. You may set up a standard for length, or weight, or time, and so on, but if you do, you employ it only as a reference; or you may establish standard sizes for plates and wires, screw threads, taper-pins, rolled sections, and so on, because there is sufficient variety to allow of great modification in the grouping together of such standard parts. A designer may select from standard rolled sections one that will always come sufficiently near to his calculated proportions to meet reasonable practical requirements, or he may find in the lists of screws some size that fits his needs. We may put it in another way. Molecules are the standard details of the chemist.

He may group them together and make, for example, certain dyes. If he was told that he must always assemble them in a few specified forms, the world would have few aniline colors. It is because he is continually trying new groupings of his standard parts that new dyes are being continually found. Machinery is in a like case. Let us by all means standardize our molecules—our nuts and bolts, and wires and rods, our plates and rolled sections—but let us beware of too much standardization in the manufacture of ships, and tools, and locomotives and machinery in general. We know perfectly well the commercial advantages, but engineers have always fought against being mere manufacturers, and we hope they will continue so to fight. The committees censure the great railway companies because each locomotive engineer designs his own engines in his own way. They suggest that if the locomotive men would but put their heads together they could reduce the present variety to a dozen types. And so no doubt with ships and marine engines. Heaven defend us from that dull day. There will be no interest left in mechanical engineering, when standardized men, in standardized workshops, operate standardized machine tools turning out standardized products for distribution by a standardized selling agency to a standardized public. That is standardization run rampant. It may mean commercial life; it certainly means intellectual death.—*"Random Reflections" in The Engineer.*

## CONSERVE TIN

THERE is a widespread belief that the cost of genuine babbitt can be cheapened without injury to its quality by the addition of lead, and also that the quality of a lead base metal can be improved by increasing the tin content—this latter idea being based no doubt on the principle that if a little tin is good more tin is better.

Without knowledge of the effect produced in alloying certain kinds and proportions of metals, it is an easy matter to fall into grave errors in compounding babbitts. Notwithstanding that these intermediate grades of babbitts are constantly being used and recommended by various manufacturers, it is a fact that no babbitts based on such formulas have ever been popularized because they can only be used successfully under most favorable conditions or forced lubrication, and they can generally be counted on to fail under heavy pressures, high speeds and scant lubrication. They will not stand up under a crucial test chiefly because of their low fusibility which makes them highly susceptible to the influence of frictional or initial heat.

These intermediate grades of babbitts seem to be most desirable as far as outer appearances go; they will also stand the usual physical tests of hammering, cutting and bending. But when these alloys are put in service, they sooner or later give trouble which is generally attributed to some mechanical defect or to the lubrication, as users are in the dark as to any other probable cause.

Apparently there is a never-ceasing demand for such alloys because each person or concern has to go through the same troublesome experiences for themselves until they are finally forced to return to the use of either a genuine babbitt or a lead base alloy before they get relief from their babbitt troubles, and in a majority of cases they turn to some well known advertised brand as offering the best security.

As stated before, the chief trouble in using these intermediate grades of babbitts is caused by their low melting points, and the examples given further on will make clear the extent to which alloys of tin, lead and antimony are influenced by certain mixtures.

The melting point of a strictly genuine babbitt and also a strictly lead base babbitt, are both around 500° Fahr. This is about as high a melting point as can be obtained in a babbitt alloy. The melting point of a babbitt is always lower than the arithmetic mean and variations from certain rules in mixing reduces the melting point below the melting point of the most fusible metal in the alloy.

As an illustration, take a mixture of 87 per cent. lead and 13 per cent. antimony; the melting point of lead is 619° Fahr. and of antimony 834° Fahr. It would be most natural to suppose that adding antimony to lead would bring the mixture to a higher point than lead, and as the mean melting point figures 645° Fah., it would not be unreasonable to expect to obtain at least the melting point of lead, but as a matter of fact the melting point of this alloy is 477° Fahr. This is the lowest melting point of the series of lead and antimony mixtures, and forms what is termed an eutectic.

When we come to tin and lead mixtures, we have two eutectics or low melting points—one around 60 per cent. tin and 40 per cent. lead, which melts about 336° Fahr.; the other around 60 per cent. lead and 40 per cent. tin, which melts around 412° Fahr. This last mixture is known commercially as "wiping solder" and is used for that purpose by plumbers because it remains in a pasty stage in cooling throughout 70° Fahr.

The foregoing illustrations show why babbitts made along these lines are foredoomed to give trouble if there is put upon them any stress that raises the temperature, or the lubrication is lacking in either quantity or quality. The admixture of certain other metals in babbitt alloys or the presence of certain impurities also contribute towards bearing troubles.

Apparently there are only two grades of babbitt metals worth considering for bearing purposes—a genuine babbitt, the other a properly balanced lead base metal. Of these two compounds the lead base metal is in most general use on bearings that are well seated or soldered to their backings. There seems to be ample evidence that lead base metals wear longer, run cooler, absorb less power and are less dependent upon lubrication than a genuine babbitt; they also stand up well under heavy pressures and high speeds and appear not to be affected injuriously by grit and dust, and contrary to the general belief, a genuine babbitt will not withstand heavier pressures than will a lead base metal. The chief virtue of a genuine babbitt is its malleability, which enables it to withstand distortion under shock from pounding on loose shell bushings. Babbitt users who are prejudiced in favor of genuine babbitt or the intermediate grades, can undoubtedly use a high grade lead base metal on a majority of their bearings with both benefit and economy and at the same time help conserve the tin supply, which is most important at this time.

## PNEUMATIC HAMMERS AND HEALTH

IN accordance with its plan of eliminating as far as possible preventable diseases among workers in various industries, the United States Public Health Service of the Treasury Department has begun an investigation of the effect on the health of workers of pneumatic hammers as used in cutting limestone.

It has been learned that inconvenience is felt by workers in this industry in using the air hammers in soft stone because of a temporary numbness of the fingers whenever the hand becomes chilled. No serious consequences resulted from this disorder but it appeared well to find the reason of the condition and to see if it could not be remedied.

### Two Causes Discovered

The most important cause was found to be the higher vibration rate of the hammers when used in soft stone, and the second cause the tight and strained grasp which the workers had to use. Cold weather brought out the symptoms, but was not in itself a cause of the condition.

By using a shank of larger diameter, which would permit a more comfortable grasp by the worker, it is believed that a good deal of the strain on the muscles would be relieved. If the shank were enlarged by using a tight-fitting covering of asbestos or some similar substance, the cold would not be intensified as at present by the metal, and the handle would act as a shock absorber.

THE following average weights per brake horse-power for various classes of engines were given in a paper by Mr. P. N. Everett, recently read at Newcastle-on-Tyne:—Triple expansion steam engine for cargo boat (no boilers or auxiliaries), 130; triple expansion, including boilers and auxiliaries, 450; Diesel engine for cargo boat (no auxiliaries), 250; Diesel engine with all auxiliaries, 400; turbines, for cross-channel boat, with boilers and auxiliaries, 200; Diesel engines for submarines, 50; steam reciprocating engines for destroyers, 35; turbines for destroyers, with boilers, etc., 30; petrol engines for motor cars, 15; petrol engines for racing boats, 7½; aero engines, 2½.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## SPINDLE IGNITION TUBE MULTIPLE DRILLING MACHINE

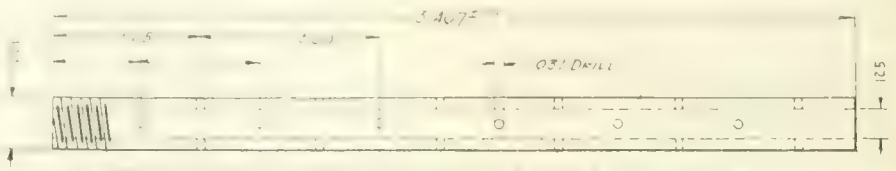
THE machine illustrated by Figs. 1 and 2 was designed specially for drilling in one operation the twenty-four .031 holes in the wall of the primer ignition tube shown in the accompanying line drawing. The machine is hand and foot operated and the drilling is done by two six-spindle multiple drill heads located 90° apart on the upper half of a vertical face plate. The spindles in one head are offset to a position midway between those in the other head.

Each head drills diametrically through both walls of the tube. The drills are held in small taper threaded collets in

12 SPINDLE MULTIPLE DRILLING MACHINE.

the chuck end of drilling spindles, and the drilling heads provided with full ball bearings are driven by an endless woven canvas belt at the back of the machine. A screw belt tightener is used to obtain the proper driving belt tension.

The feed for the drilling heads is operated by a long hand lever mounted on a sleeve pinion which meshes through an intermediate gear to a ring gear located concentrically in the vertical face plate to which the drilling heads are attached. The ring gear is mounted on ball bearing so as to make the feel of hand lever as sensitive as possible. The ring gear is connected to the drill head feed sleeve by means of double pinions, the pinion for feed sleeve having friction clutches so that it is possible to locate each head individually to its proper drilling position, also to facilitate the

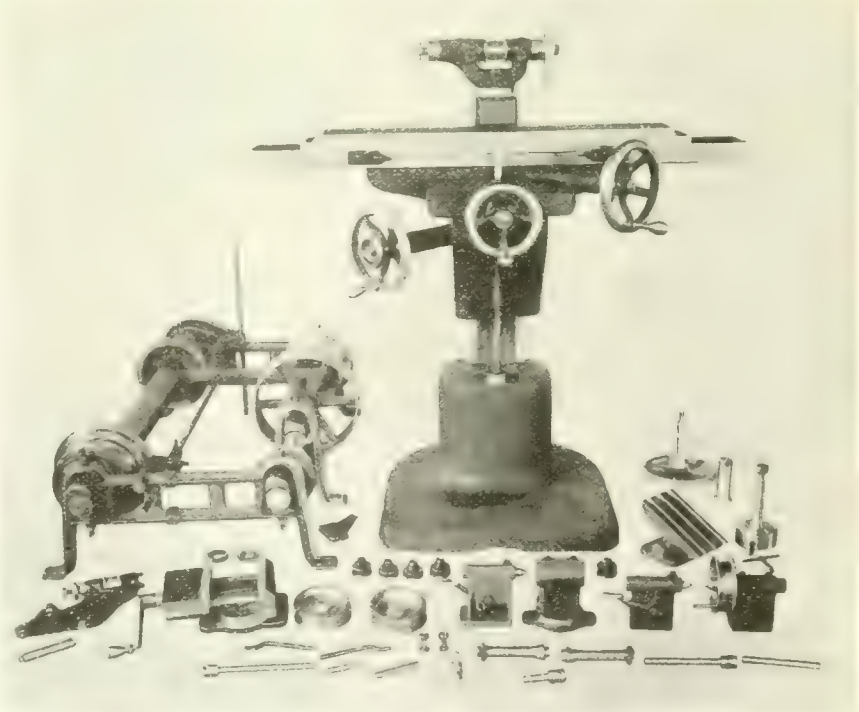


SAMPLE OF WORK DONE BY MULTIPLE SPINDLE DRILLING MACHINE.

putting in and taking out of drills. The feed lever has a spring return.

The drilling spindles run at 4,800 r.p.m. Special means are provided for insuring generous lubrication to all high moving parts. An unskilled operator can drill seven tubes per minute. A cutting fluid similar to Cut-rite is used and is supplied by a rotary pump. The tube to be drilled is held and located in its drilling position by means of self-opening and closing jig. The jig is mounted upon a slide, the friction of the slide being to carry the tube from the loading position to the drilling position and vice versa. The slide is operated by a foot lever, the depressing of which moves the slide to the loading or out position and also automatically opens the jig and releases the tube. When the drilled tube is taken out and a blank one put in, the foot lever is released. The releasing of the foot lever first causes the jig to close and then moving it to the drilling position at the intersection of drilling heads. The tube is held at the ends by means of 45° cups. The jig has drill guide bushings and an open top which permits the quick loading and unloading of the jig, also a free access of the cutting fluid to the drills.

A thumb-spring lever is used automatically for lifting the front end of tube out of the jig so that the operator can easily take hold of it. The machine is driven by a 3 h.p. Westinghouse electric motor mounted in the base of machine. A ball-bearing belt, tightening pulley is used for motor belt. This machine is manufactured by the Langelier Mfg. Co., Arlington, Cranston, R.I.



UNIVERSAL GRINDER WITH STANDARD EQUIPMENT.

## UNIVERSAL GRINDER

THE Universal grinder illustrated herewith and manufactured by the Manhattan Machine and Tool Works, Grand Rapids, Mich., has been developed as a result of the increasing demand for

rapid and accurate output occasioned by the present war.

The swivel head swings centrally with the drive pulley, and is mounted on a 4-inch neck. This neck projects 4½ ins. into the column at the joint, resulting in a very stiff construction and one that keeps the head from rising. A graduated dial is provided, and ample oil chambers take care of the lubrication. An eight inch wheel can be used to the very bottom.

The table has a longitudinal travel of 22 in., a vertical travel of 2 in., and a transverse travel of 8 in., which is quite ample for all ordinary requirements. One end of the table is graduated in degrees and the other end in taper per foot.

Two sets of head and tail stocks are provided, one for chucking work and one for long work.

The three-point bearing on the internal attachment provides a non-vibrating construction which is of considerable advantage on precise work. With this attachment it is possible to use wheels from 4 inches down.

The swivel vise-jaws are 1¼ in. by 5 ins., and open 5 ins. This vise is flat and very convenient in use.

The long ways upon which the saddle is mounted makes a very rigid construction. The saddle is operated by a conveniently located hand wheel and screw convenient to the operator's left hand.

## A NEW TOTE BOX RACK

The rack shown in the accompanying illustration is manufactured by the New Britain Machine Co., New Britain, Conn., and accommodates the tote boxes manufactured by the same firm.

Although especially valuable for stock and assembling room use, the time and space-saving capacity of this rack is such as to recommend its much more extended employment in many factories. While simple in design and comparatively light in weight, its construction is such as to afford ample stiffness to withstand any load that may be placed in it.

The front uprights are flat steel; those at the rear angles. Angle runners upon which the boxes slide are electrically welded to each pair of uprights. These welded members are connected by cross ties at the front, the back being closed in and stiffened by sheets bolted to the angle upright.

TOTE BOX RACK SHOWING RUGGED CONSTRUCTION

standard units, as illustrated. They may, however, be expanded horizontally to any extent and upon special order will be built to accommodate a greater number of boxes in each tier. Units are frequently placed back to back with a common sheet metal division between. Particular attention is drawn to the safety feature illustrated. When a box is hauled out, if forward end is permitted to sag slightly, the raised rear end will come in contact with front cross tie, permitting loading or unloading in this exposed position without danger of box sliding out.

Shipment may be made either assembled or knocked down. Erecting is a simple and rapid operation. The method of procedure recommended is to bolt the back sheets to the uprights, one at a time, beginning with the left end, as you face the front of the rack. This done, the cross ties are next inserted and bolted to the uprights, working also from the left end toward the right. Lastly, the top is put in place.

## ERRATUM

IN the issue of April 11, and on page 388, the name of the manufacturers of the 25-in. double back-geared lathe there described was unfortunately omitted. The Sidney Tool Co., Sidney, Ohio, are the manufacturers of this product.

## FRENCH WOMEN AND NIGHT WORK

THE need for intensifying the production of war munitions and material has, since the beginning of the war, led in France to a relaxation of the laws and regulations concerning the maximum duration of the working day, concerning the labor of women and children, and concerning night work. Especially as regards night work for women, frequent exemptions from the law have been granted. But serious social disadvantages soon became apparent, according to a United States Consular report from Paris, as the result of these exemptions and the public authorities began restricting their number.

### Night Work Gradually Reduced

A circular dated June 29, 1916, prescribed certain limits for the employment of women at night. Then gradually employers themselves undertook to restrict further the night employment of female labor, with the result that an investigation begun by the Ministry of Labor on May 31, 1917, shows that female labor at night has been reduced to almost insignificant proportions. The investigation embraced 787 private industrial establishments employing at night 58,784 women, or 36 per cent. of the total number of women working in these establishments. Of the above number 519 were under 16 years of age and 1,576 were between 16 and 18 years of age. The average duration of night work was 10 hours.

### Improved Regulations Made

It is reported that improvements have been made everywhere in the conditions and circumstances affecting the night work of the women. Husband and wife are employed at the same hours, so that they may take their meals together, there are eight-hour shifts, so that night work is required of each shift only one week in three; women are intrusted with the lighter kinds of work; the rest periods have been made more numerous; female workers living in the same quarter of the town are grouped together in the factory.

### Other Improvements Soon to Be Effected

In the belief that in the interest of the family further modifications might be made in the same direction without jeopardizing the requirements of the national defence, the committee in charge of female labor conditions gave expression to a certain number of desiderata which will soon be carried into effect. It is urged that no girls under 18 years of age be employed at night, and that night work for women in no case be permitted to last longer than 10 hours. It is also urged that night work for females of all ages shall be suppressed whenever the conditions affecting the supply of raw materials, of motive power, and of labor are such as to make it possible to obtain the same output by means of day labor alone; that when the output of a factory is decreased night work be curtailed first of all for women.

## MAN-POWER DEMANDS AND THE SUPPLY

THE claims of essential and useful industries will not be of much avail in retarding the progress of the new order-in-council which has been rendered necessary through the sluggish operation of the cumbersome Military Service Act.

The evidence offered at exemption applications during the past winter was sufficient to convince the most sanguine that neither the cause nor its helpers would receive a square deal.

Events move steadily and unrelentingly and however slow they may seem in their individual occurrence, their ultimate results are daily becoming more evident with a certainty which none can gainsay.

Certainly there will be few employers who can say they suffer unjustifiable loss through being deprived of individuals up to twenty-three years of age. The specialized nature of munitions production consists chiefly in the object for which the articles are being made.

The real munition makers are the designers of the jigs and fixtures, special machines and tooling outfits. Such work requires an experience such as few men of twenty-three or under are likely to have. Their work has been chiefly that of pulling down high piece-work wages made possible by the knowledge and skill of these older men, many of whom are drawing less money.

That many of these younger men have had no previous experience except on farms, etc., has not altogether endeared them to the great body of general machinists. They have been after the job from purely mercenary motives while many older, conscientious skilled mechanics who have joined various branches of the service were more justified in hanging onto their good jobs. The young profiteer has had his day.

## STEEL DEMAND WILL CONTINUE BRISK

THE question of steel supply is of such ever-increasing gravity that too much importance cannot be attached to the recent agreement arrived at between the Canadian Government and the Dominion Iron & Steel Co. for the erection by the latter of a plate mill.

When the proposal was first put forward some months ago we expressed the opinion that present benefits might be offset later by having to meet renewed competition from the States.

Events continue to show, however, that present benefits are so absolutely essential that future conditions can very well be left to themselves. The immense war program of the United States is gradually assuming definite shape and one of its features is the constantly increasing requirements in tonnage, not only for shipbuilding and munitions, but for military construction work.

Some few weeks ago it was thought that the completion of certain projects would relieve tonnage requirements, but the opposite has been the case.

Steel shipments have risen to 60,000 tons per week of which about 60 per cent. is plates, and in discussing the question of steel supplies for the future, J. Leonard Replogle, Director of Steel Supplies, in the course of a recent controversy, stated that domestic shipyard requirements plus engagements made by United States to its Allies would make such a total as would continuously strain the capacity of the plate mills.

Prospects of a sufficiency of steel plate in Canada are thereby weakened, while the wisdom of the Government's action is accordingly strengthened. Long before the time plates are flooding the market, the new mill will have justified itself, not only as a war measure but as an economic feature of Canadian industry.

## SHOULD CANADA HAVE HER OWN CLASSIFICATION SOCIETY?

THE certainty of a great merchant marine being possessed by the United States in the near future and, presumably permanently afterward, has already given rise to an agitation in favor of an American classification society so that the insurance business resulting from marine activity may be handled by native companies.

A special committee on merchant marine of the Boston Chamber of Commerce recently addressed a report to the Senators and Representatives in Congress, in which they stated that one essential of complete success in American shipbuilding and navigation was a thoroughly American inspection, survey and classification service capable of performing for the United States a work which Lloyd's has long rendered for the British Empire.

In voicing a demand for attention from the officials of the United States Shipping Board, Winthrop L. Marvin states that "under the law creating it, the Shipping Board will hold its huge merchant fleet only temporarily, as a trustee for the American people, with the avowed purpose of transferring it to citizen owners to be operated by private enterprise as soon as possible after this present war has ended. And the Shipping Board is under obligation to arrange for the inspection and insurance of these hundreds of American ships in such a way that after the war they can remain under the American flag as carriers of peaceful commerce.

"Such a prospect is not very bright if their classification remains under the control of that nation which will be their chief competitor."

In view of the instances of discrimination cited by Mr. Marvin, the parallel of Canada's shipping situation is immediately suggested. Discussion is however limited by the ultimate intention of the Canadian Government as to whether it will operate the new fleet on a permanent basis.

Such a circumstance might possibly result in it carrying part of its own insurance so as to offset any effort of Lloyd's in favor of British owned vessels, but the discouraging effect on private ownership of such a policy will doubtless be given full consideration at the proper time.

The advent of a Canadian merchant marine under government auspices should carry with it the germ of a future Canadian Bureau of Shipping, which, by placing some of the burdens and handicaps of the past on the shoulders of the country as a whole, would do much to insure the continued benefit of our new fleet in the hands of private owners, should the Government's present action be limited to a certain after war period.

REGULATIONS have now been approved by order-in-council whereby the registration of the man and woman-power of Canada will be effected. Every person over sixteen years of age will be affected and provision is made to add those who afterward attain the age of sixteen or are discharged from active service.

# FOUND THAT EDITOR WORKED IT SAME WAY

**Arthur F. Boyer Submitted One of His Problems to CANADIAN MACHINERY for Solution**

ARTHUR F. BOYER, foreman machinist for the T. McAvity & Sons, Ltd., St. John, N.B., believes in making use of every source of information he can lay his hands on when he meets with a difficult or out-of-the-ordinary problem. In his work he is called upon to lay out a good deal of work for which there is no particular precedent or custom. Especially has this been so in recent years. Parts are called for that have never been thought of before. War business has called for shapes and tricks that were not known before.

ARTHUR F. BOYER

Mr. Boyer is not easily down-on any of these matters. At the same time he wants all the information he can secure.

For instance a few months ago, he was called upon to turn an oval from steel with a major axis of 7½ inches and a minor axis of four inches. He saw that there were several ways of accomplishing this, but was anxious to make certain that he had accomplished the work in the easiest way. So he put down the particulars, and forwarded a sketch to CANADIAN MACHINERY. "This paper," said Mr. Boyer, "went very fully into the whole matter, and shortly issued a diagram showing what they considered as the best way, going again into the matter at a later date. It was some satisfaction," remarked Mr. Boyer, "to see that CANADIAN MACHINERY arrived at practically the same method I had followed in turning out this work."

Mr. Boyer was born in Devonshire, England, in March of 1862, but moved to Canada with his parents when he was a mere lad. Attending the day schools at St. John, he was early apprenticed to the machinist trade. It was only natural that he should turn to the machine shop, as his father was in the firm of Byers and Boyer. He was only 14 years of age then, but kept up his studies while he served his time. Subsequently he worked with Campbell & Fowler, where he remained for four years, then going to Campbell Bros., where he remained for eleven years.

In 1889 Mr. Boyer entered the employ of the McAvity people, having been with them continuously for 29 years. He reads technical papers and trade journals of all sorts, and in them finds new material and the ideas of others who are facing the same problems that he is. "For either the trained man or the young mechanic, just starting there is no better reading matter," stated Mr. Boyer to CANADIAN MACHINERY. "They keep you closely in touch with the latest models in use, and the difficulties others are meeting with and how they are solved."

# EMERY SHIPMENT FROM GREECE GETS THROUGH

E. W. SAWYER, manager of Dominion Abrasive & Wheel Co., Ltd., Mimico, speaking to a representative of CANADIAN MACHINERY regarding the output from shops making their line of goods, remarked that they had not been able to run to capacity for some time back.

"On the outbreak of the war," said Mr. Sawyer, "the supply of emery was almost cut off. It used to come largely from Turkey and Greece. Of course we got no more from Turkey and the supply from Greece went largely into the hands of the French. Manufacturers from United States and Canada have made representations to the Allied governments with the result that one shipment of some 2,000 tons of emery from Greece has reached United States, and the Canadian firms will get a share of this, only it will not amount to much. The authorities do not want to use tonnage to ship anything that is not being used directly for war purposes. That provision should make it easier for us to get material, as fully 75 per cent. of our output goes to munitions shops and the balance to agricultural implement makers. As a matter of fact," concluded Mr. Sawyer, "we have not been running over fifty per cent. capacity for months past as we can't get the material. The makers of artificial abrasives cannot begin to turn out enough to keep the factories going at full speed. It is likely that more emery shipments will be made soon. They can't come too rapidly or too often to suit the makers of abrasive wheels."

## The Little Things Count The Most

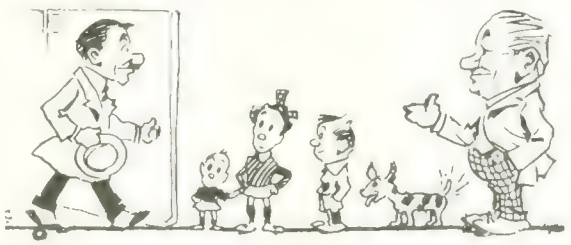
OLD JONES, he didn't have no cash to sprinkle on the turf, in fact he didn't own a thing on all this dreary earth—his son was just a wholesome chap, with little surplus cash, he grew to husky manhood on prunes and crust and hash.

His daughter likewise never dressed in hunks of silken cloth, nor did she ever get a chance to cut a sizzlin' swath.

And Jones had never made a pile or grabbed a sheaf of stocks, in fact he spent most of his time most mighty near the rocks—he didn't have no wallet fat nor yet a purse what's stout, nor would he leave a big estate to legalize about.

He moved not in the topmost heap, he was of humble mind, of quiet and simple point of view, his manner clean and kind.

But he helped to shuffle round the house and do jobs here and there; he helped to turn dark into light, and wallop out dull care. And in his kindly way he'd take old



trouble by the skin and boot him from the premises and whack him on the chin.

He paid his way right straight along, he didn't owe a cent—his way ran on in pleasant paths, he camped with sweet content.

His was a happy little home, it lived within the law, a smile was wreathed about his face, it trickled o'er his jaw—his friends they found a welcome there, they liked to drop around, they never got an earful of a harsh or raspin' sound.

So it's little things that count the most, and don't miss that, me boy—they hatch a lot of wholesome fun and rear a peck of joy—they put the roller on your grief and chase away your fears, and sprout a pile of love and mirth instead of briny tears.—ARK.

# The Demand for Munitions Still Keeping Business Brisk for Both Tools and Supplies

## Demand for Steel at the Mills is an Unending One—Jobbers Are Winding Up a Very Good Month's Business—English Agents in Canada in Hard Way to Keep Business They Book Here.

HEAVY buying of all lines in any way affected by war business keeps interest centred in that direction. More and more business in the iron and steel world in both United States and Canada is being forced into the war groove. If edges are cut off in volume, the trimming falls on the non-essential lines.

The labor situation causes a little uneasiness, not because of any impeding May-day strikes, but because there is not sufficient skilled labor for new work contemplated. The turning out of munitions keeps up a constant demand for men who can take charge of machines working to very fine dimensions, and while labor can be found to operate the machines it is a hard matter to get men to get out the tools, gauges, etc.

Smaller sizes in tubes are needed in Canada. Boilers need repairing to help out the power situation, and tubes are called for. Dealers say that the situation is not improving, nor do they see any chance for better conditions soon.

The demand for supplies for munitions plants is brisk and jobbers report inquiries for all the standard lines. One Toronto firm has 75 lathes nearing completion for a munition plant.

Canadian agents for English firms are reporting difficulties in securing the shipment of their orders, with the result that orders are cancelled and odd shape shipments are left on their hands.

# RIVER NAVIGATION WILL SOON COME TO HELP OF MONTREAL MILLS

Special to CANADIAN MACHINERY.

MONTREAL, Que., April 23, 1918.—Industrial conditions in this district have shown improvement during the past week and general manufacturing activity has been quite brisk. The movement on the various railroads is more regular in character and deliveries, both locally and from points in the States, indicate a better condition in transportation generally. The early opening of river navigation is assured owing to the recent movement of the heavy ice and the channel below Montreal is practically open. It is expected that within the next few days the buoys will all be placed in position for the season's activity. The intimation that 12-inch American shell contracts had been placed with a local firm was the result of negotiations that had been under way for some time; it appears, however, that owing to difficulties in connection with the forgings, these contracts have not materialized. Orders for the 9-inch have, however, been placed with a firm in Montreal and also with a firm in New Brunswick. The demand for machine tools has been quite active and general sales have been good. Steel requirements have been as insistent as ever with the market in domestic material almost nil. The coal situation is still acute. It is thought that little or no anthracite will be shipped from the States to points west of Winnipeg.

### Steel

Conditions throughout the steel industry in and about Montreal are little changed from that of last week, and production continues unabated in all the mills of the district. The shortage of pig iron is still pronounced, but sufficient is coming through to meet the immediate requirements of the manufacturers. Available scrap for electric steel production has been scarce during the past few weeks, but the better delivery of the past week has given relief to this situation. Activity in freight car construction is quite brisk in all car shops in this locality. The inability to get delivery of domestic steel from points in the States has almost eliminated the possibility of structural work of an ordinary character being carried on, as every facility is being provided to stimulate production for war purposes and other immediate essentials. The difficulties of obtaining sufficient ship plates for maximum operations has greatly delayed the construction of steel vessels. Three steel vessels are expected to be launched from the yard of the Canadian Vickers Company during the coming month; these are of 8,000 tons displacement. Some anxiety is being shown in industrial circles owing to the possibilities that may develop as May Day approaches. One firm in Montreal has had trouble with its machinists going out on strike, this having been in force now for about a month. No definite settlement has yet been reached and the firm is still handicapped for skilled men. Shipbuilding activity promises to show an increase this summer; negotiations are under way whereby a number of prominent men of Montreal contemplate the erection of a plant in or near Halifax. Another berth is to be added to the plant of the Canadian Vickers and it is expected to be completed about the fall of this year. Local dealers are not over-impressed with existing conditions, and although plate prices are quoted lower than they have been for several months past, the available supply is, if anything, more limited than ever. Heavy plates coming from the States are exceptionally hard to get owing to the heavy demand for these in the American shipyards.

### Metals

Little variation has been manifest in the metal situation, and with the exception of tin the market has developed no features of importance. Better delivery has resulted from the improvement in transportation conditions, and consumers are obtaining supplies with less difficulty. Copper is steady under the ruling quotation. Tin is the dominating factor of the market, the uncertainty of the permit question retaining a very strong condition. Spelter is quieter with a lower tendency. Lead is not active and has a weaker undertone. Antimony has declined on poor demand. Aluminum is steady but inactive.

Copper.—The market continues to be steady in character and sales are above normal. Little but essential requirements are allowed to come through and domestic activity has been reduced to the minimum. Brass interests are regular buyers. Nothing definite has as yet been announced as to any change contemplated in the price that will be effective during the coming three or six months, but certain factions of the trade are looking forward to a slightly higher price than that now ruling. Dealers here continue to quote 29 and 30 cents on a steady but firm market.

Tin.—The abnormal uncertainty that prevails in this market continues to retain this metal in a very strong position. The great difficulty in getting permits and the resultant uncertainty of delivery makes this market a very nervous one, and consumers are showing considerable anxiety as to their future operations, owing to their inability to obtain supplies for early future requirements. Announcements from England show the market there to be in an exceptionally strong position, with quotations £8 per ton higher than the previous week. Local dealers report a very

steady demand but are unable to give consumers any definite delivery on metal owing to the lack of knowledge pertaining to the shipment of metal from England and other sources. Local quotations show an advance over last week of 4 cents per pound, the price asked being $1 per pound.

### Machine Tools and Supplies

Considerable interest was shown in the machine tool industry a week ago over the announcement that contracts were likely to be placed for large American shells. It has developed, however, that no orders for the 12-inch will be placed at the present time and this has had the tendency to create an easier market for the heavier tools. Orders for the 9-inch and further contracts for the 4.7 and the 6-inch are assured, and manufacturers and dealers are looking forward to renewed activity. Enquiry has been good for general equipment, and dealers report very good business. Activity in small tools and general supplies is brisk, particularly in connection with requirements for munition and marine plants. Delivery on many lines is as backward as ever and it is not thought that much relief will be given to the machine tool trade by the opening of water highways.

### Scrap

The situation in old materials continues to be uneventful. Dealers report an uncertain condition with slight activity in brass scrap, which has shown a little strength. Prices in general are unchanged and the market is comparatively quiet.

## NEW PLANTS BEING BROUGHT INTO SHAPE

### Munitions Work Still Keeps Tool and Supply Centres Engaged

TORONTO.—Despite the tendency in some places to think that the munitions business has seen its best days in Canada, the demand for tools and supplies for this line of work continues to keep business brisk for the dealers and manufacturers. New equipment is under the process of finishing now for greater production of several of the lines of larger shells, a number of lathes being about ready for shipment.

The production of the 12-inch shell means new equipment for this work alone. There has been some speculation among the trade regarding the chances of plants that had done up to the 9-inch shell turning over and equipping their machines for the 12 inch contracts. This is not an easy matter, and means quite an outlay for chucks, etc. Not only so, but one of the elements entering into such a shifting just now is the supply of men sufficiently skilled to do the work. They are scarce, and that means a long wait in the process, which all wish to avoid since speed enters into the situation to a very great extent.

## POINTS IN WEEK'S MARKETING NOTES

Tubes, 2 inches and smaller, are needed for boiler repairs, but it is almost impossible to secure them.

New equipment is being turned out for the fitting up of new plants to handle shell orders.

Canadian agents of English firms report more than usual difficulty in the filling of orders.

Conditions at Pittsburg show that there are new demands for steel and there seems to be no let-up to the variety and quantity called for.

The appointment of C. M. Schwab as head of the Emergency Fleet Corporation is having a far-reaching effect in the steel mill circles.

Forging capacity of U. S. plants cannot keep up with ability of shops to machine shells.

The rate of production of pig iron, steel ingots and finished steel for the month of April is reckoned about 85 per cent. of capacity.

Machine tools, cranes and other equipment is being bought heavily for U. S. Ordnance Department.

Many of the large guns ordered in United States will be mounted on railroad trucks.

United States Government may have to recruit labor for the manufacture of heavy machine tools.

Shortage of cars to the mines is blamed for the shortage in coke production, especially in the Connellsville district.

Lake shipping is helping trade toward more speedy delivery in Toronto and lake district.

Cars of material are arriving more readily from the rolling mills than for some months past.

### Iron and Steel

Supplies of plate are arriving freely in Toronto yards, orders coming through in much better time than they have been doing for many months past. The opening of the navigation season is making it much quicker to turn this stock over to the consumer. Trade is good all through, and several local dealers stated to CANADIAN MACHINERY that the month which is just drawing to a close had been one of the most satisfactory for a long time. Although the channels in which they may do business are very much restricted the demand has increased to a very great extent along these particular lines. This is especially true of steel plate. In fact this article is well on toward representing three-quarters of the business being transacted through local dealers at the present time.

"We could dispose of a lot of tubes right now if there were any way of getting them," stated one dealer this morning. "There is a very pronounced tendency to get steam plants into shape in places where electric power has been used. This is due to the demand for power. In some cases tubes are needed for the repairing of these boilers, and it is imperative that they should be repaired, but there are no tubes in sight at the present moment. The two-inch size would move out quickly but they are hardly to be had at all."

There are no price changes this week. The market seems to be firm, with no indications of a change either up or down.

### Scrap Metals

Wrought iron pipe was marked up from $13 to $17 by Toronto buyers today. That is the only price change recorded. The advances noted in these columns last week are still holding. These advances are generally accepted as indicating that there is a movement in the lines mentioned and that the dealers are in the market to replenish their stocks at the new values. The advance in wrought iron pipe is caused by the run on No. 1 wrought and No. 1 railroad rod. Bar iron mills are busy and calling for this line of material. The yards of dealers in scrap metals are not by any means overstocked, and there is still a call for scrap metals owing to the scarcity of pig iron, relief for which does not seem to be immediately in sight.

### Old Country Trade

Toronto representatives of English firms dealing in high-speed lines are having their own troubles at the present moment and not a few losses are falling to them as a result. Canadians are not giving what may be termed as import orders just now, nor have they been doing so for some time past. Here is the experience of one Toronto dealer who has a good connection. "Some thirteen weeks ago I placed an order for a Canadian firm with my people in Sheffield. The goods are on the way, we know that, but farther than that we do not know. The Canadian buyer tells me if delivery is not made in a week or so more he will have to cancel his order. This same thing has happened before. What happens? The stock passes back on my hands. It is not the line or style that a man will stock because the shapes are out of the ordinary and for special work. I will have to sell them as best I can or keep them indefinitely. Canadian customers will not place import orders for standard lines, but want to pursue a hand-to-mouth policy, with the agency taking the chances." Stocks of

[illegible] steel are depleted in all centres.

**Tools and Supplies**

Business is up to the good standard that has been maintained during the past [illegible]. Deliveries are more prompt, but trade still follows the abnormal war industries, and a large amount of new equipment is being brought near completion for this purpose. One might imagine that there is enough machine capacity on the floors of the existing plants now to take care of all the war business that is offering, but this is not the case. It has been found in many cases that when a plant turned from the machining of one size to a larger size shell that the equipment would not handle the work, even after the making of the necessary changes. Very few of the munition plants were equipped with the idea of carrying any overload, and all this has meant business for the machine tool interests.

The demand for chucks of the larger sizes is brisk. Drills, etc., are also in good demand. Prices are firm, the lists showing no changes at all over the quotations of the last few days.

**Non-Ferrous Metals**

There have been no incidents worthy of mention in the local market or trading for these lines. Copper is still listed around $28. Tin nears the $100 mark. Supplies are very small, and the market price hardly gives a correct idea of the money that can be secured by a seller who is really in a position to deliver the article. Demand continues satisfactory in all lines with the prices at former levels.

## LOOKING TO CANADA FOR OUTPUT OF CARS

**And U. S. Board Will Work With Dominion Regarding Labor Measures**

Special to CANADIAN MACHINERY.

WASHINGTON, April 23.—A great step forward in the shipping programme of United States was taken this week when Charles Schwab, head of the Bethlehem Steel Corporation, was made director-general of the Shipping Board.

It is generally conceded that Schwab is one of the greatest industrial leaders of United States, and if he can not push the shipping programme through to a rapid completion nothing can be done which will speed up the programme.

Edward N. Hurley and Charles Piez will continue to hold their positions with the Shipping Board, but from now on Schwab will be the highest authority. The first step taken by the new director-general was to insure an adequate steel supply for ships. For several weeks there has been a controversy between the Shipping Board and the Railroad Administration concerning priority of steel. Railroad Administration officials desired steel for cars and the Shipping Board has been anxious to secure steel for ships. A final agreement has been reached giving the Shipping Board priority over steel for everything but warships. The Railroad Administration has been forced to reduce its programme, which called for 1,250,000 tons of steel plates for locomotives and cars. With a large programme for freight cars on its hands the Railroad Administration is now confronted with a lack of steel to carry out this programme. Officials are extremely anxious to secure the cars, declaring that they will be absolutely necessary to maintain traffic and to insure the nation against further traffic congestion. It has been suggested that the programme may be carried out with wooden cars substituted for steel cars.

**Looking to Canada**

Again officials of the Railroad Administration are turning their eyes to the Canadian market, and if they find it possible it is probable that they will open negotiations within a short time with the Canadian Government in effort to secure permission to place some contracts for steel cars with Canadian manufacturers. If they find this impossible they will attempt to secure a loan of steel plates from the Canadian Government.

**Moves the Offices**

Another step taken by Schwab, which is expected to increase the efficiency of the Shipping Board, is the removal of a large part of the staff to Philadelphia. This city has been the headquarters since the inception of the Shipping Board, but Philadelphia is the logical centre of the shipbuilding industry on the Atlantic coast. Schwab will direct operations from Philadelphia in the future and headquarters will be maintained in Washington only for the purpose of carrying on the legal and business end of the work. The administrative work will be directed from Philadelphia.

An agreement has also been reached between the Shipping Board and the Railroad Administration for special cars to bring needed lumber to the Atlantic Coast from the Pacific Coast. By May 1 eighteen additional wooden ships are to be launched, which will make a total tonnage of 63,000 tons in wooden ships completed thus far. Additional contracts for 20,000 tons of wooden shipping have been let.

**Wants More Power**

Chairman Hurley, of the Shipping Board, has this week written to members of Congress asking for wider powers. He declares that under existing conditions it is impossible for the United States to effectively commandeer ships in foreign or neutral ports. It is understood here that this measure is aimed partially at a small number of ships which have been plying from Canadian ports, and have thus been able to escape Government requisitioning.

**Helping the Canadian**

In order that Canadian industries may not be hampered by the export license law the War Trade Board has this week, after conference with members of the Canadian War Mission, issued a list of articles which may be exported to Canada without securing special export licenses. The list includes all sorts of brass, copper, nickel, aluminum and a long list of chemicals used in the industries.

Closely following the appointment of Schwab as director-general of the Shipping Board there has come a well-founded rumor that Henry Ford has been asked by President Wilson to accept a similar position with relation to aircraft. In view of the pressing need for speed in the aircraft programme the Aircraft Board is at the present time casting about for further factories, which may be able to add to the capacity for manufacture. It is suggested that some Canadian factories may be asked to manufacture parts, in exchange for which the United States may be able to reciprocate by manufacturing other commodities for the Canadian Government or by releasing a larger quantity of steel.

**Working With Canada**

The National War Labor Board met for the first time this week. Within a

## MIDDLE WEST OF CANADA ON VERGE OF ERA OF DEVELOPMENT AND GROWTH

Wm. Garlock, of the Garlock-Walker Machinery Co., Toronto, says the middle west of Canada is in better shape than it has been for some time past. He has just returned from a trip to the Pacific coast, having called at Fort William, Port Arthur, Winnipeg, Saskatoon, Prince Albert, Regina, Calgary, Edmonton, Vancouver, as well as several western U. S. points.

"The cities at the head of the lakes are busy in ship and car building. The Winnipeg labor market seems fairly balanced, but with some out-of-works. The lumber country of the north, around Prince Albert," continued Mr. Garlock, "is busy. They have cut a lot of timber there during the winter and there's a good year ahead. I was surprised at the great attention that is being paid now to the prevention of fire in the timber limits, and the regulations that have to be complied with in the matter of clearing up the land after taking off the timber. People have put off building so long that they can't put it off any longer, and they have the money to see it through now."

Regarding the ship-building industry at the coast, Mr. Garlock was not too certain about the stability of the impetus that this industry had given to business. Conditions, of course, are much better than they have been for some years. Much was also heard there of the project to open a steel plant at the coast.

"But give the middle west a good crop this year," concluded Mr. Garlock, "and it will come into its own in a way that will surprise the rest of the Dominion."

short time the members of the board will meet with Canadian labor officials, and attempt to settle upon a labor policy which will work in harmony with that of the Canadian Government, in order that there may be no shifting of labor across the border, a situation which has caused not a little trouble in the industrial cities bordering upon the Great Lakes.

C. A. Greathouse and Arthur E. Holden have been appointed representatives of the United States to study industrial occupational work in Canada for partially disabled soldiers.

## VERY HEAVY ORDERS PLACED IN U.S.

### Ordnance Department Work Keeps Production of Tools at Top Notch

Special to CANADIAN MACHINERY.

NEW YORK, April 23.—Ordnance makers, shipbuilders, railroads and manufacturers of aircraft, motors, tanks, as well as the United States Government, have been in the market during the last week for machine tools, cranes and other machinery. No large single orders were placed, but in the aggregate buying was considerable.

Among the very large prospective contracts is one for the equipment of the mammoth machine shop which will be built at the projected Government arsenal, which it is expected to be built in the Pittsburg district. Since last September when the U. S. Government began negotiations with the United States Steel Corporation for the building of a large gun forging plant at Gary, Ind., the Ordnance Department of the army also entered into the preliminary negotiations with the corporation for a large supply of steel to be furnished to a Government arsenal which would exceed in size any other Government plant in the country. The corporation has agreed to furnish the steel either by building an open hearth plant in the vicinity of the arsenal or by bringing the steel from a nearby plant already in operation. The machinery for the shop to be built at the arsenal will require the expenditure of several million dollars and as the tools will be of a very heavy type the orders will have to be placed in the near future to insure their installation by the time the plant is ready, which means some time in 1919.

#### Large Gun Orders

The speeding of the Government program for the manufacture of all munitions of war is expected to bring large orders for guns into the market in the next two weeks. Many of the cannon ordered will be mounted on railroad trucks but it will require from ten to twelve months even to obtain the large tools required for such work. Both the guns and the shells to be fired from them will run from eight to sixteen inches.

Government work is being delayed because manufacturers of heavy tools, notably gun-boring and gun-turning lathes, have been unable to fulfil contracts because of the shortage of labor. At Detroit 20,000 to 30,000 skilled workmen are needed, and Government assistance is being asked. Important work for both the War and Navy Departments is being held up because of the lack of machinery. Many men have been lost through the army drafts and it is believed that the Government may find it necessary to recruit labor for manufacturers of heavy tools.

#### Capacity Cramped

The Wright-Martin Aircraft Corporation, New Brunswick, New Jersey, has been buying tools against recent inquiries and options covering 500 machines that are required to execute a Government contract for Hispano-Suiza aviation motors. The corporation expects to increase capacity by either leasing an established factory or by building a new plant at Philadelphia, Atlantic City or Poughkeepsie, N.Y.

Among the shipbuilders the New York Shipbuilding Corporation at Camden, N.J., is buying punching machines and the Atlantic Corporation has bought some tools for its yard at Portsmouth, New Hampshire. The American International Shipbuilding Corporation has purchased cranes at Bedford, Ohio, for the Hog Island yard and the Tennessee Co. has purchased 15 cranes at Pittsburg for the Chickasaw Shipbuilding Co. at Mobile, Ala.

The Pennsylvania lines east and west of Pittsburg and the Louisville and Nashville have been buying shop equipment and the Chicago, Burlington & Quincy has a large list of tools pending.

The Du Pont Engineering Co., Wilmington, Del., is buying additional equipment for the Government powder plant at Nashville, Tennessee, as the War Department has ordered the plant capacity doubled. The Quartermaster's Department has been buying machine tools in Philadelphia for the Aberdeen Proving Ground. Some large foreign orders are pending.

## ABOUT READY TO LAUNCH "CONCRETIA"

### Initial Trials Will Soon Be Given to the New Type of Vessel

Special to CANADIAN MACHINERY.

MONTREAL, April 23.—During the winter months the Atlas Construction Company has been busily engaged in puting the finishing touches to the concrete boat "Concretia." Mr. Jarvis, the secretary of the company, stated that in the course of a few weeks or probably earlier, the boat would be ready for her initial trials. Every hope is entertained that these will be successful.

#### Enlarge Capacity

Canadian Vickers Limited are preparing plans for another shipbuilding berth to facilitate greater production of steel vessels. The new addition will be constructed to accommodate ships up to 10,000 tons displacement and will be erected adjoining the present buildings. It is expected that the new berth will be completed by the fall of this year.

#### Building Three

During the past winter good progress has been made on the steel vessels under construction by the Canadian Vickers Limited, and three vessels of about 8,000 tons each are nearing completion; one of these boats is for the Norwegian Government, while the other two are on the old contract of the Imperial Munitions Board. It is anticipated that all of these will be launched before the end of May. Some delay has been experienced during recent months owing to the difficulty of obtaining plates in sufficient quantities for maximum operations.

## THERE IS NO END TO THE CALL FOR STEEL

### New Demands Quickly Cropping Up Keep the Pittsburgh Mills Very Busy

Special to CANADIAN MACHINERY.

PITTSBURGH, Pa., April 23.—As reflected in previous reports, the steel trade has hitherto been disposed to feel that the authorities at Washington had a tendency to exaggerate the danger of a shortage of steel for war purposes, the steel trade feeling that all war requirements would not total more than 50 per cent. of the output. The steel producers did not, of course, contend that there would be a plentiful supply of steel for all purposes, their attitude being that the remaining 50 per cent. could hardly supply the non-war or ordinary commercial demand. There were those in the trade, not producers, who held other views as to this, and felt that if 50 per cent. of the production were left for all commercial purposes dissociated from the war, it would probably constitute a fairly comfortable if not an actually excessive supply.

There has lately been a change of view on the part of the steel producers as to Government requirements. The requirements are appraised at a greater tonnage than formerly. There are two new factors in the general problem of trying to determine how the supply of steel is going to fit in future months. First, while it was formerly thought that many of the early war requirements in steel would disappear, not to be replaced by others, it is now seen that new requirements are constantly appearing. The early orders, of course, involved much steel that would be used in construction work, and it was argued that when this construction was accomplished, that class of war steel demand would disappear. Actual developments, however, have been that when these cases of construction work are taken care of the military authorities find other projects, and thus there seems to be no end.

Second, the shipbuilding work promises to take more steel, regularly, than was recently supposed. When, a few weeks ago, the shipbuilding interests called for more steel, the steel producers' analysis of the situation was that they were calling for steel at a greater weekly rate than they could possibly use, and all that would be necessary would be

the fabricating shops and the shipyards stocked up, whereupon the authorities would themselves be quite content to have the rate of shipment reduced. It has developed in the past week, indeed, that about three weeks ago there was an actual controversy on this subject. J. Leonard Replogle, Director of Steel Supplies, took the side of the steel producers to the extent of showing what was to him the obviously large quantity of steel that had been shipped from the mills for account of shipbuilding, shipments having risen to about 60,000 tons a week, of which about 60 per cent. was plates, but he very positively took the side of the shipbuilding interest when it came to a matter of steel supplies for the future, insisting that the domestic shipyard requirements, plus the engagements the Government had made to its Allies, would make such a total as would continuously strain the capacity of the plate mills.

### The Call for Plates

It was about the beginning of this month that the steel mills undertook, by instructions from Washington, to increase their shipments of war steel, and particularly of plates, but their attitude at the time was that they would not need to do this for long. Now they show an expectation of this pressure continuing indefinitely.

The appointment of C. M. Schwab as Director-General of the Emergency Fleet Corporation has served to strengthen these views as to the future requirements of shipbuilding. The entire steel trade has confidence that however much improvement in performance the shipyards have lately recorded, Mr. Schwab is going to add greatly to those results. There is every prospect that Mr. Schwab's appointment will count, from his personality, his great knowledge of shipbuilding, and the almost unlimited authority he has been given in this new position. Mr. Schwab leaves all his personal affairs. Long ago, with no thought of anything of this sort, he had announced that the managements of the Bethlehem and associated properties had been so aligned that he could drop out at any time and the work would go right long.

### The Shell Steel Program

It has developed that most recent accounts have exaggerated the volume of shell steel buying that is contemplated for the second half of the year. Some estimates have been printed, running up to 4,000,000 tons for the second half, which appeared to be based upon authentic information, but it turns out that they were estimates based partly upon mistakes. The tonnage to be bought in the present buying is much less than 4,000,000 tons. However, the rate of producing shells has increased materially, and it will increase more. Some of the shell steel bought for delivery by June 15 will run well over July 1 in delivery, partly on account of changes in specifications and partly by reason of the shortage of forging capacity, as there has not been enough forging capacity to keep all the shell making factories busy. By this time that situation has been remedied as to all sizes 6-inch and under, and it will probably be remedied shortly as to the larger sizes as well.

### Production

The rate of production, in pig iron, steel ingots and finished steel, has not increased very materially over the average rate maintained in March. There has been a slight increase, perhaps, but hardly enough to balance the fact that at many mills the stocks accumulated, which were drawn upon when the railroads loosened up, are now largely exhausted, so that without any increase in production shipments would now be less than those being made from three to six weeks ago. As a general average, it may be said that production all along the line, since March 1, has been at about 85 per cent. of capacity. Roughly speaking, this represents approximately the tonnage produced in 1916 and 1917, but whereas the production during the major part of 1916 represented the existing capacity, at the present time the same tonnage is only about 85 per cent. of capacity, because the capacity has been so materially increased.

The chief restrictive influence in production continues to be shortage of coke. This is now confined chiefly to beehive, the by-product ovens being in nearly every instance well supplied with coal, so that they can operate full. The movement of beehive coke is restricted particularly in the case of Connellsville, the Connellsville region shipments last week and week before having been somewhat below the average in March, when of course there was a great improvement over the early weeks of the year. The railroads appear to be making strenuous efforts to furnish more cars to the coke region, but with indifferent success thus far.

The Carnegie Steel Company this week operated 49 of its 59 blast furnaces, ten being entirely out of blast. The company's banked furnaces have all resumed, but on Monday two of them had a close call, some coke arriving just in time to avoid banking. For over two weeks the Republic Iron & Steel Company has been seeking a supply of coke to blow in an idle furnace, and without success thus far. A merchant furnace interest in the Shenango valley, which has hitherto depended entirely upon Connellsville coke, has made a deal whereby it secures by-product coke from elsewhere and pays for it in pig iron. However, expectations are that production will gradually improve from this point. A little more complaint is being heard of labor shortage in the central west.

## TRAINING THE MEN FOR SKILLED LINES

**Unique Methods Being Followed by Educational Board in Buffalo**

Special to CANADIAN MACHINERY.

BUFFALO, April 23.—The need for skilled mechanics in Buffalo has led to the adoption of extraordinary advertising methods by the Educational Board here.

For example, here is the message on a hanger displayed in the street car windows: "War Trade Instruction. Evening Classes Re-open April 8. Your country needs trained men. Buffalo's industries need skilled mechanics. Courses: Machine shop practice: drafting tool design, tool forging, oxy-acetylene welding, gas engine work, automobile repairing, airplane woodworking, radio and buzzer work, practical electricity, industrial chemistry, photography."

Four vocational and six high schools are equipped for this class of instruction.

It would appear that Buffalo at least is adopting a plan whereby the supply of trained mechanics would be made dependable. The method of advertising and the plan of education is probably the more interesting in view of Robert Donaldson's statement (Canadian Machinery, April 4), that "Canada has never trained enough men for particular work."

---

A MEETING of the Ontario section of the A.S.M.E. was held at 8 p.m., April 18, at the Engineers' Club, Toronto. Professor Angus presided and the local members and a number of visitors and prospective members were favored with a very interesting paper on the "Heat Treatment of Low Carbon Steel," by Mr. W. M. Wilkie of the steel department of the Imperial Munitions Board.

The discussion that followed the paper bore principally on the trouble encountered by the producers and users of shell steel. Among the engineers present were a number of those connected with local munitions plants, and their remarks based on actual experiences and the solution of various troubles under war time conditions were very interesting.

Before the paper was read the meeting appointed Mr. W. P. Robinson of the Northern Crane Works, Limited, to be chairman of the committee on increased membership, reappointed the secretary, C. B. Hamilton, as delegate to the joint committee of technical organizations (Ontario branches) and appointed a nominating committee of two, Messrs. Flettermeyer and Ward, to prepare a slate for the elections of section executive which will take place by letter ballot within the next few weeks.

---

THE original microphones employed by the Allies for the detection of the submarine depended upon the hum of the engines and motors and operated quite satisfactorily until the Germans saw fit to mount their motors on sound absorbing bases. However, the later systems employed have reached a high state of perfection, and not only detect the presence of the submarine, but also find its exact position, and this whether the German craft are running at top speed or resting on the bottom.

# SELECTED MARKET QUOTATIONS

# The MONTREAL Heavy-Duty Rough Turning Lathe

## Description

**BED** is of heavy massive construction, wide and deep, well braced with box section girths, ways are flat, provision is made at rear side for attaching profiling attachment when needed.

**HEADSTOCK**—Cast integral with bed giving great rigidity and permanent alignment. Two gear ratios are obtainable through gearing and change is made instantly by means of jaw clutches. Drive is by 8" belt on backgear shaft through friction clutch. On account of the integral construction the gears can be of large diameter and full advantage has been taken of this feature. Bearings are of best bronze, ample oiling facilities are provided, covers are furnished for gears.

**CARRIAGE** is very heavy, with wide bridge, has long bearing on ways, will not spring under heaviest cuts, plain heavy duty rest with graduated collar, hand feed to cross slide.

**APRON**—One piece double wall type giving support to both ends of shafts. Gears are of steel or semi-steel, worm wheel of bronze. External friction plate of large diameter giving great power for feeds.

**FEEDS**—Three provided through felt from spindle.

**TAILSTOCK** of massive design with long nose making it unnecessary to extend tailstock spindle for ordinary work. Spindle is of large diameter. Four clamping bolts are provided to secure tailstock to bed.

**OIL PAN** of heavy gauge sheet steel.

**PUMP**—Trahern Rotary Pump provided for supplying lubricant to tools.

No countershaft is furnished as friction and jaw clutches are part of machine, drive is direct from line shaft.

# Daylight Saving Seems to Make Very Little Difference to the Industrial Plants

## CANADIAN MACHINERY Asks Heads of Manufacturing Concerns How the New Scheme Was Received—More Benefits Will be Derived From It Later On.

DAYLIGHT saving has not made much difference to industrial plants—in fact it makes much difference to the men working there. It is fair to say however that there has been no trouble in the bringing into effect of the new schedule and that in a few weeks time it will work more satisfactorily than it does at present.

It will be remembered that when it was attempted to bring it to pass last year there was a mild form of revolution. Sir George Foster brought the matter up in the Ottawa House, but it got no farther. It was a dead one from the very start, owing to the amount of unrelenting opposition that developed toward it in the House. A number of municipalities tried it out, but with indifferent success, as part of the community was on daylight time, with the rest of the folks telling them they were crazy for having tinkered with their watches.

CANADIAN MACHINERY has asked a number of manufacturers how the change was made in their plants, and the following answers have been received:

International Malleable Iron Co., Ltd., Guelph.—"The plan of daylight saving was inaugurated in our factory at the appointed time and no confusion resulted. Working conditions have not been upset in any way, but on the other hand, probably owing to the dull mornings during the present week, no decided advantage has yet been apparent. While our employees have not yet registered any objections, and the successful operation of the shop has not been interfered with, our experience so far does not tend to make us enthusiastic over the change, as no actual saving of light has been shown. We have found it necessary to have artificial lighting early in the morning, whereas previous to Sunday last this was not necessary. But we think the plan will work out entirely satisfactorily, and prove a benefit to almost everyone during the summer months, the only criticism which we heard from our employees being that they think it is being extended over too long a period. Some of them think that April 14th is a little early to start, and that it should not be continued beyond September 30th.—W. H. Burgess, General Manager.

—

The Preston Woodworking Machinery Co., Preston, Ont.—"Daylight saving has gone into effect in our plant without any noticeable difference between it and the time by which we went formerly. Nobody seems to make any comments on it, so from this we would take it that everybody is perfectly satisfied."—A. M. Kerr, Sec.-Treasurer.

—

Nicholson File Co., Port Hope, Ont.—"As far as the operation of our factory is concerned the daylight saving does not make any difference, as at the present time there is full daylight during the ten hours the factory runs, under either system. It does, however, give the men more time to look after their gardens after working hours."—E. M. Thurber, Res. Manager.

—

Dominion Forge & Stamping Co., Ltd., Walkerville, Ont.—"As yet we have not changed our factory time to conform with the new "daylight saving" schedule. The factories in general in this district disapprove of the change for the reason that many of our employees live across the river in Detroit, and a discrepancy in time between their homes and factory is inconvenient. For this reason alone we do not approve of the change but as a general proposition, where there are not two different times conflicting, we consider it an advantage.—Pearson Wells, Secretary-Treasurer.

—

The Ford-Smith Machine Co., Hamilton.—"We have found that it makes absolutely no difference here. In the main, the men feel that daylight saving offers them nothing of moment, and we think that the few objections we have here are just a matter of conservatism, and we should hear the same complaint in regard to any change of whatever nature it might be. We are running night and day in this plant, and the night gang come on at six at night, and work until seven the next morning. These men have already asked (since daylight saving was put into force) that we allow them to come in at seven o'clock at night during the hot weather of the summer, instead of six. We shall probably agree to this change. Otherwise we see no difference here, and as far as the firm is concerned we do not think it makes any difference to us in any way.—P. Ford-Smith, President and Manager.

—

Goold, Shapley & Muir Co., Ltd., Brantford, Ont.—"Daylight saving went into force last Monday, without any friction, and we have little or no grumbling from the employees. In fact the majority are strongly in favor of it.—John Muir, Mgr.

A. B. Jardine & Co., Hespeler, Ont.—"We do not find that daylight saving makes any appreciable difference in our works."—John Jardine.

—

Dominion Steel Foundry Co., Ltd., Hamilton.—"The change was made without confusion or disturbance and so far without complaint."—A. G. Wright, Secretary.

—

The John Bertram & Sons Co., Ltd., Dundas.—"In this conection I would state that there is no question of the benefit which will be derived to manufacturers from the change recently made. I have heard amongst our employees no adverse criticisms of the plan and consequently think it is working out all right."—Henry Bertram, Treasurer.

—

The William Kennedy & Sons, Ltd., Owen Sound.—"Same seems to work out quite satisfactorily. The only objections which we have had are from a few men who have been in the habit of coming back at 5 o'clock in the morning to remove freshly cast iron castings from the sand, castings which have been cast the evening before. However, we do not expect that this inconvenience will last long."—T. D. Kenendy, Director.

—

MacKinnon, Holmes & Co., Ltd., Sherbrooke, Que.—"The Daylight Saving Act was put into effect in this locality without the slightest inconvenience, and is proving a boon to all."—Geo. D. MacKinnon, General Manager.

—

Hamilton Bridge Works Co., Ltd.—"In connection with this matter, would advise that we have yet to hear of any complaints on the adoption of the daylight saving. As far as we can see there is no complaint in regard to it. Would further state that daylight saving has been adopted by all the Allies, and, after due deliberation, we feel that all those who have the interest of the Allies at heart should adopt it without comment, and objection."—W. B. Champ, Managing Director and Secretary.

—

The Canadian Blower & Forge Co., Ltd., Kitchener.—"We have found this to work out very well as far as our plant is concerned. The men do not object to it, and all seem to like it. This city is peculiar in that most of our workmen own their own homes, and take a decided interest in conservation of food supplies, and practically all have their own gardens. The additional time in the evening is much appreciated by them owing to the fact that it enables them to give
